Access points have distinct permissions and network controls that Amazon S3 on Outposts applies for any request that is made through that access point. Each access point enforces a customized access point policy that works in conjunction with the bucket policy that is attached to the underlying bucket. For more information, see Access points.

For more information about working with access points in S3 on Outposts, see Working with S3 on Outposts buckets.

The following topics show you how to view your S3 on Outposts access point policy by using the AWS Management Console, AWS Command Line Interface (AWS CLI), and AWS SDK for Java.

### Using the S3 console

1. Open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Outposts access points**.
3. Choose the Outposts access point that you want to view the policy for.
4. On the **Permissions** tab, review the S3 on Outposts access point policy.

5. To edit the access point policy, see Adding or editing an access point policy.

### Using the AWS CLI

The following AWS CLI example gets a policy for an Outposts access point. To run this command, replace the *user input placeholders* with your own information.

```
aws s3control get-access-point-policy --account-id 123456789012 --name arn:aws:s3-
outposts:region:123456789012:outpost/op-01ac5d28a6a232904/accesspoint/example-outposts-
access-point
```

### Using the AWS SDK for Java

The following SDK for Java example gets a policy for an Outposts access point.

```
import com.amazonaws.services.s3control.model.*;

public void getAccessPointPolicy(String accessPointArn) {

    GetAccessPointPolicyRequest reqGetAccessPointPolicy = new
 GetAccessPointPolicyRequest()
            .withAccountId(AccountId)
            .withName(accessPointArn);

    GetAccessPointPolicyResult respGetAccessPointPolicy =
 s3ControlClient.getAccessPointPolicy(reqGetAccessPointPolicy);
    System.out.printf("GetAccessPointPolicy Response: %s%n",
 respGetAccessPointPolicy.toString());
    printWriter.printf("GetAccessPointPolicy Response: %s%n",
 respGetAccessPointPolicy.toString());

}
```

## Working with Amazon S3 on Outposts endpoints

To route requests to an Amazon S3 on Outposts access point, you must create and configure an S3 on Outposts endpoint. In order to create an endpoint, you will need an active connection with your service link to your Outposts home region. Each virtual private cloud (VPC) on your Outpost can have one associated endpoint. For more information about endpoint quotas, see S3 on Outposts network requirements. You must create an endpoint to be able to access your Outposts buckets and perform object operations. For more information, see Endpoints.

After you create an endpoint, you can use the 'Status' field, to understand the state of the endpoint. If your Outposts is offline, it will return a CREATE_FAILED. You can check your service link connection, delete the endpoint, and retry the create operation after your connection has resumed. For a list of additional error codes, see below. For more information, see Endpoints.

| API | Status | Failed Reason Error Code | Message - Failed Reason |
|---|---|---|---|
| `CreateEndpoint` | Create_Failed | OutpostNotReachable | Endpoint could not be created as the service link connection to your Outposts home Region is down. Check your connection, delete the endpoint, and try again. |
| `CreateEndpoint` | Create_Failed | InternalError | Endpoint could not be created due to Internal Error. Please delete the endpoint and create again. |
| `DeleteEndpoint` | Delete_Failed | OutpostNotReachable | Endpoint could not be deleted as the service link connection to your Outposts home Region is down. Check your connection and please try again. |
| `DeleteEndpoint` | Delete_Failed | InternalError | Endpoint could not be deleted due to Internal Error. Please try again. |

For more information about working with buckets on S3 on Outposts, see Working with S3 on Outposts buckets.

The following sections describe how to create and manage endpoints for S3 on Outposts.

**Topics**

- Creating an endpoint on an Outpost
- Viewing a list of your Amazon S3 on Outposts endpoints
- Deleting an Amazon S3 on Outposts endpoint

## Creating an endpoint on an Outpost

To route requests to an Amazon S3 on Outposts access point, you must create and configure an S3 on Outposts endpoint. In order to create an endpoint, you will need an active connection with your service link to your Outposts home region. Each virtual private cloud (VPC) on your Outpost can have one associated endpoint. For more information about endpoint quotas, see S3 on Outposts network requirements. You must create an endpoint to be able to access your Outposts buckets and perform object operations. For more information, see Endpoints.

### Permissions

For more information about the permissions that are required to create an endpoint, see Permissions for S3 on Outposts endpoints.

When you create an endpoint, S3 on Outposts also creates a service-linked role in your AWS account. For more information, see Using service-linked roles for Amazon S3 on Outposts.

The following examples show you how to create an S3 on Outposts endpoint by using the AWS Management Console, AWS Command Line Interface (AWS CLI), and AWS SDK for Java.

### Using the S3 console

1. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Outposts access points**.
3. Choose the **Outposts endpoints** tab.
4. Choose **Create Outposts endpoint**.
5. Under **Outpost**, choose the Outpost to create this endpoint on.
6. Under **VPC**, choose a VPC that does not yet have an endpoint and that also complies with the rules for Outposts endpoints.

   A virtual private cloud (VPC) enables you to launch AWS resources into a virtual network that you define. This virtual network closely resembles a traditional network that you would operate in your own data center, with the benefits of using the scalable infrastructure of AWS.

   If you don't have a VPC, choose **Create VPC**. For more information, see Creating access points restricted to a virtual private cloud.
7. Choose **Create Outposts endpoint**.

### Using the AWS CLI

#### Example

The following AWS CLI example creates an endpoint for an Outpost by using the VPC resource access type. The VPC is derived from the subnet. To run this command, replace the *user input placeholders* with your own information.

```
aws s3outposts create-endpoint --outpost-id op-01ac5d28a6a232904 --subnet-id
 subnet-8c7a57c5 --security-group-id sg-ab19e0d1
```

The following AWS CLI example creates an endpoint for an Outpost by using the customer-owned IP address pool (CoIP pool) access type. To run this command, replace the *user input placeholders* with your own information.

```
aws s3outposts create-endpoint --outpost-id op-01ac5d28a6a232904 --subnet-id
 subnet-8c7a57c5 --security-group-id sg-ab19e0d1 --access-type CustomerOwnedIp --
customer-owned-ipv4-pool ipv4pool-coip-12345678901234567
```

### Using the AWS SDK for Java

#### Example

The following SDK for Java example creates an endpoint for an Outpost. To use this example, replace the *user input placeholders* with your own information.

```
import com.amazonaws.services.s3outposts.AmazonS3Outposts;
import com.amazonaws.services.s3outposts.AmazonS3OutpostsClientBuilder;
import com.amazonaws.services.s3outposts.model.CreateEndpointRequest;
import com.amazonaws.services.s3outposts.model.CreateEndpointResult;

public void createEndpoint() {
    AmazonS3Outposts s3OutpostsClient = AmazonS3OutpostsClientBuilder
                .standard().build();

    CreateEndpointRequest createEndpointRequest = new CreateEndpointRequest()
                .withOutpostId("op-0d79779cef3c30a40")
                .withSubnetId("subnet-8c7a57c5")
                .withSecurityGroupId("sg-ab19e0d1")
                .withAccessType("CustomerOwnedIp")
                .withCustomerOwnedIpv4Pool("ipv4pool-coip-12345678901234567");
    // Use .withAccessType and .withCustomerOwnedIpv4Pool only when the access type is
```

```
    // customer-owned IP address pool (CoIP pool)
    CreateEndpointResult createEndpointResult =
 s3OutpostsClient.createEndpoint(createEndpointRequest);
    System.out.println("Endpoint is created and its ARN is " +
 createEndpointResult.getEndpointArn());
}
```

## Viewing a list of your Amazon S3 on Outposts endpoints

To route requests to an Amazon S3 on Outposts access point, you must create and configure an S3 on Outposts endpoint. In order to create an endpoint, you will need an active connection with your service link to your Outposts home region. Each virtual private cloud (VPC) on your Outpost can have one associated endpoint. For more information about endpoint quotas, see S3 on Outposts network requirements. You must create an endpoint to be able to access your Outposts buckets and perform object operations. For more information, see Endpoints.

The following examples show you how to return a list of your S3 on Outposts endpoints by using the AWS Management Console, AWS Command Line Interface (AWS CLI), and AWS SDK for Java.

### Using the S3 console

1. Open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Outposts access points**.
3. On the **Outposts access points** page, choose the **Outposts endpoints** tab.
4. Under **Outposts endpoints**, you can view a list of your S3 on Outposts endpoints.

### Using the AWS CLI

The following AWS CLI example lists the endpoints for the AWS Outposts resources that are associated with your account. For more information about this command, see list-endpoints in the *AWS CLI Reference*.

```
aws s3outposts list-endpoints
```

### Using the AWS SDK for Java

The following SDK for Java example lists the endpoints for an Outpost. For more information, see ListEndpoints in the *Amazon Simple Storage Service API Reference*.

```
import com.amazonaws.services.s3outposts.AmazonS3Outposts;
```

```
import com.amazonaws.services.s3outposts.AmazonS3OutpostsClientBuilder;
import com.amazonaws.services.s3outposts.model.ListEndpointsRequest;
import com.amazonaws.services.s3outposts.model.ListEndpointsResult;

public void listEndpoints() {
    AmazonS3Outposts s3OutpostsClient = AmazonS3OutpostsClientBuilder
                .standard().build();

    ListEndpointsRequest listEndpointsRequest = new ListEndpointsRequest();
    ListEndpointsResult listEndpointsResult =
 s3OutpostsClient.listEndpoints(listEndpointsRequest);
    System.out.println("List endpoints result is " + listEndpointsResult);
}
```

## Deleting an Amazon S3 on Outposts endpoint

To route requests to an Amazon S3 on Outposts access point, you must create and configure an S3 on Outposts endpoint. In order to create an endpoint, you will need an active connection with your service link to your Outposts home region. Each virtual private cloud (VPC) on your Outpost can have one associated endpoint. For more information about endpoint quotas, see S3 on Outposts network requirements. You must create an endpoint to be able to access your Outposts buckets and perform object operations. For more information, see Endpoints.

The following examples show you how to delete your S3 on Outposts endpoints by using the AWS Management Console, AWS Command Line Interface (AWS CLI), and AWS SDK for Java.

### Using the S3 console

1. Open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Outposts access points**.
3. On the **Outposts access points** page, choose the **Outposts endpoints** tab.
4. Under **Outposts endpoints**, choose the endpoint that you want to delete, and choose **Delete**.

### Using the AWS CLI

The following AWS CLI example deletes an endpoint for an Outpost. To run this command, replace the *`user input placeholders`* with your own information.

```
aws s3outposts delete-endpoint --endpoint-id example-endpoint-id --outpost-
id op-01ac5d28a6a232904
```

**Using the AWS SDK for Java**

The following SDK for Java example deletes an endpoint for an Outpost. To use this example, replace the *user input placeholders* with your own information.

```
import com.amazonaws.arn.Arn;
import com.amazonaws.services.s3outposts.AmazonS3Outposts;
import com.amazonaws.services.s3outposts.AmazonS3OutpostsClientBuilder;
import com.amazonaws.services.s3outposts.model.DeleteEndpointRequest;

public void deleteEndpoint(String endpointArnInput) {
    String outpostId = "op-01ac5d28a6a232904";
    AmazonS3Outposts s3OutpostsClient = AmazonS3OutpostsClientBuilder
                .standard().build();

    Arn endpointArn = Arn.fromString(endpointArnInput);
    String[] resourceParts = endpointArn.getResource().getResource().split("/");
    String endpointId = resourceParts[resourceParts.length - 1];
    DeleteEndpointRequest deleteEndpointRequest = new DeleteEndpointRequest()
                .withEndpointId(endpointId)
                .withOutpostId(outpostId);
    s3OutpostsClient.deleteEndpoint(deleteEndpointRequest);
    System.out.println("Endpoint with id " + endpointId + " is deleted.");
}
```

# Working with S3 on Outposts objects

With Amazon S3 on Outposts, you can create S3 buckets on your AWS Outposts and easily store and retrieve objects on premises for applications that require local data access, local data processing, and data residency. S3 on Outposts provides a new storage class, S3 Outposts (OUTPOSTS), which uses the Amazon S3 APIs, and is designed to store data durably and redundantly across multiple devices and servers on your AWS Outposts. You communicate with your Outpost bucket by using an access point and endpoint connection over a virtual private cloud (VPC). You can use the same APIs and features on Outpost buckets as you do on Amazon S3 buckets, including access policies, encryption, and tagging. You can use S3 on Outposts through the AWS Management Console, AWS Command Line Interface (AWS CLI), AWS SDKs, or REST API.

Objects are the fundamental entities stored in Amazon S3 on Outposts. Every object is contained in a bucket. You must use access points to access any object in an Outpost bucket. When you specify the bucket for object operations, you use the access point Amazon Resource Name (ARN) or the

access point alias. For more information about access point aliases, see Using a bucket-style alias for your S3 on Outposts bucket access point.

The following example shows the ARN format for S3 on Outposts access points, which includes the AWS Region code for the Region that the Outpost is homed to, the AWS account ID, the Outpost ID, and the access point name:

```
arn:aws:s3-outposts:region:account-id:outpost/outpost-id/accesspoint/accesspoint-name
```

For more information about S3 on Outposts ARNs, see Resource ARNs for S3 on Outposts.

Object ARNs use the following format, which includes the AWS Region that the Outpost is homed to, AWS account ID, Outpost ID, bucket name, and object key:

```
arn:aws:s3-outposts:us-west-2:123456789012:outpost/ op-01ac5d28a6a232904/bucket/amzn-s3-demo-bucket1/object/myobject
```

With Amazon S3 on Outposts, object data is always stored on the Outpost. When AWS installs an Outpost rack, your data stays local to your Outpost to meet data-residency requirements. Your objects never leave your Outpost and are not in an AWS Region. Because the AWS Management Console is hosted in-Region, you can't use the console to upload or manage objects in your Outpost. However, you can use the REST API, AWS Command Line Interface (AWS CLI), and AWS SDKs to upload and manage your objects through your access points.

# Upload an object to an S3 on Outposts bucket

Objects are the fundamental entities stored in Amazon S3 on Outposts. Every object is contained in a bucket. You must use access points to access any object in an Outpost bucket. When you specify the bucket for object operations, you use the access point Amazon Resource Name (ARN) or the access point alias. For more information about access point aliases, see Using a bucket-style alias for your S3 on Outposts bucket access point.

The following example shows the ARN format for S3 on Outposts access points, which includes the AWS Region code for the Region that the Outpost is homed to, the AWS account ID, the Outpost ID, and the access point name:

```
arn:aws:s3-outposts:region:account-id:outpost/outpost-id/accesspoint/accesspoint-name
```

For more information about S3 on Outposts ARNs, see Resource ARNs for S3 on Outposts.

With Amazon S3 on Outposts, object data is always stored on the Outpost. When AWS installs an Outpost rack, your data stays local to your Outpost to meet data-residency requirements. Your objects never leave your Outpost and are not in an AWS Region. Because the AWS Management Console is hosted in-Region, you can't use the console to upload or manage objects in your Outpost. However, you can use the REST API, AWS Command Line Interface (AWS CLI), and AWS SDKs to upload and manage your objects through your access points.

The following AWS CLI and AWS SDK for Java examples show you how to upload an object to an S3 on Outposts bucket by using an access point.

AWS CLI

**Example**

The following example puts an object named `sample-object.xml` into an S3 on Outposts bucket (`s3-outposts:PutObject`) by using the AWS CLI. To use this command, replace each *`user input placeholder`* with your own information. For more information about this command, see put-object in the *AWS CLI Reference*.

```
aws s3api put-object --bucket arn:aws:s3-
outposts:Region:123456789012:outpost/op-01ac5d28a6a232904/accesspoint/example-
outposts-access-point --key sample-object.xml --body sample-object.xml
```

SDK for Java

### Example

The following example puts an object into an S3 on Outposts bucket by using the SDK for Java. To use this example, replace each *user input placeholder* with your own information. For more information, see Uploading objects.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.ObjectMetadata;
import com.amazonaws.services.s3.model.PutObjectRequest;

import java.io.File;

public class PutObject {
    public static void main(String[] args) {
        String accessPointArn = "*** access point ARN ***";
        String stringObjKeyName = "*** String object key name ***";
        String fileObjKeyName = "*** File object key name ***";
        String fileName = "*** Path to file to upload ***";

        try {
            // This code expects that you have AWS credentials set up per:
            // https://docs.aws.amazon.com/sdk-for-java/v1/developer-guide/setup-
credentials.html
            AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
                    .enableUseArnRegion()
                    .build();

            // Upload a text string as a new object.
            s3Client.putObject(accessPointArn, stringObjKeyName, "Uploaded String
 Object");

            // Upload a file as a new object with ContentType and title specified.
            PutObjectRequest request = new PutObjectRequest(accessPointArn,
 fileObjKeyName, new File(fileName));
            ObjectMetadata metadata = new ObjectMetadata();
            metadata.setContentType("plain/text");
            metadata.addUserMetadata("title", "someTitle");
            request.setMetadata(metadata);
```

```
            s3Client.putObject(request);
        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 couldn't be contacted for a response, or the client
            // couldn't parse the response from Amazon S3.
            e.printStackTrace();
        }
    }
}
```

## Copying an object in an Amazon S3 on Outposts bucket using the AWS SDK for Java

Objects are the fundamental entities stored in Amazon S3 on Outposts. Every object is contained in a bucket. You must use access points to access any object in an Outpost bucket. When you specify the bucket for object operations, you use the access point Amazon Resource Name (ARN) or the access point alias. For more information about access point aliases, see Using a bucket-style alias for your S3 on Outposts bucket access point.

The following example shows the ARN format for S3 on Outposts access points, which includes the AWS Region code for the Region that the Outpost is homed to, the AWS account ID, the Outpost ID, and the access point name:

```
arn:aws:s3-outposts:region:account-id:outpost/outpost-id/accesspoint/accesspoint-name
```

For more information about S3 on Outposts ARNs, see Resource ARNs for S3 on Outposts.

With Amazon S3 on Outposts, object data is always stored on the Outpost. When AWS installs an Outpost rack, your data stays local to your Outpost to meet data-residency requirements. Your objects never leave your Outpost and are not in an AWS Region. Because the AWS Management Console is hosted in-Region, you can't use the console to upload or manage objects in your Outpost. However, you can use the REST API, AWS Command Line Interface (AWS CLI), and AWS SDKs to upload and manage your objects through your access points.

The following example shows you how to copy an object in an S3 on Outposts bucket by using the AWS SDK for Java.

## Using the AWS SDK for Java

The following S3 on Outposts example copies an object into a new object in the same bucket by using the SDK for Java. To use this example, replace the *user input placeholders* with your own information.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.CopyObjectRequest;

public class CopyObject {
    public static void main(String[] args) {
        String accessPointArn = "*** access point ARN ***";
        String sourceKey = "*** Source object key ***";
        String destinationKey = "*** Destination object key ***";

        try {
            // This code expects that you have AWS credentials set up per:
            // https://docs.aws.amazon.com/sdk-for-java/v1/developer-guide/setup-
credentials.html
            AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
                    .enableUseArnRegion()
                    .build();

            // Copy the object into a new object in the same bucket.
            CopyObjectRequest copyObjectRequest = new CopyObjectRequest(accessPointArn,
 sourceKey, accessPointArn, destinationKey);
            s3Client.copyObject(copyObjectRequest);
        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 couldn't be contacted for a response, or the client
            // couldn't parse the response from Amazon S3.
            e.printStackTrace();
        }
    }
}
```

# Getting an object from an Amazon S3 on Outposts bucket

Objects are the fundamental entities stored in Amazon S3 on Outposts. Every object is contained in a bucket. You must use access points to access any object in an Outpost bucket. When you specify the bucket for object operations, you use the access point Amazon Resource Name (ARN) or the access point alias. For more information about access point aliases, see Using a bucket-style alias for your S3 on Outposts bucket access point.

The following example shows the ARN format for S3 on Outposts access points, which includes the AWS Region code for the Region that the Outpost is homed to, the AWS account ID, the Outpost ID, and the access point name:

```
arn:aws:s3-outposts:region:account-id:outpost/outpost-id/accesspoint/accesspoint-name
```

For more information about S3 on Outposts ARNs, see Resource ARNs for S3 on Outposts.

With Amazon S3 on Outposts, object data is always stored on the Outpost. When AWS installs an Outpost rack, your data stays local to your Outpost to meet data-residency requirements. Your objects never leave your Outpost and are not in an AWS Region. Because the AWS Management Console is hosted in-Region, you can't use the console to upload or manage objects in your Outpost. However, you can use the REST API, AWS Command Line Interface (AWS CLI), and AWS SDKs to upload and manage your objects through your access points.

The following examples show you how to download (get) an object by using the AWS Command Line Interface (AWS CLI) and AWS SDK for Java.

### Using the AWS CLI

The following example gets an object named `sample-object.xml` from an S3 on Outposts bucket (`s3-outposts:GetObject`) by using the AWS CLI. To use this command, replace each *`user input placeholder`* with your own information. For more information about this command, see get-object in the *AWS CLI Reference*.

```
aws s3api get-object --bucket arn:aws:s3-
outposts:region:123456789012:outpost/op-01ac5d28a6a232904/accesspoint/example-outposts-
access-point --key testkey sample-object.xml
```

### Using the AWS SDK for Java

The following S3 on Outposts example gets an object by using the SDK for Java. To use this example, replace each *user input placeholder* with your own information. For more information, see GetObject in the *Amazon Simple Storage Service API Reference*.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.GetObjectRequest;
import com.amazonaws.services.s3.model.ResponseHeaderOverrides;
import com.amazonaws.services.s3.model.S3Object;

import java.io.BufferedReader;
import java.io.IOException;
import java.io.InputStream;
import java.io.InputStreamReader;

public class GetObject {
    public static void main(String[] args) throws IOException {
        String accessPointArn = "*** access point ARN ***";
        String key = "*** Object key ***";

        S3Object fullObject = null, objectPortion = null, headerOverrideObject = null;
        try {
            // This code expects that you have AWS credentials set up per:
            // https://docs.aws.amazon.com/sdk-for-java/v1/developer-guide/setup-
credentials.html
            AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
                    .enableUseArnRegion()
                    .build();

            // Get an object and print its contents.
            System.out.println("Downloading an object");
            fullObject = s3Client.getObject(new GetObjectRequest(accessPointArn, key));
            System.out.println("Content-Type: " +
 fullObject.getObjectMetadata().getContentType());
            System.out.println("Content: ");
            displayTextInputStream(fullObject.getObjectContent());

            // Get a range of bytes from an object and print the bytes.
```

```
            GetObjectRequest rangeObjectRequest = new GetObjectRequest(accessPointArn,
key)
                    .withRange(0, 9);
            objectPortion = s3Client.getObject(rangeObjectRequest);
            System.out.println("Printing bytes retrieved.");
            displayTextInputStream(objectPortion.getObjectContent());

            // Get an entire object, overriding the specified response headers, and
print the object's content.
            ResponseHeaderOverrides headerOverrides = new ResponseHeaderOverrides()
                    .withCacheControl("No-cache")
                    .withContentDisposition("attachment; filename=example.txt");
            GetObjectRequest getObjectRequestHeaderOverride = new
GetObjectRequest(accessPointArn, key)
                    .withResponseHeaders(headerOverrides);
            headerOverrideObject = s3Client.getObject(getObjectRequestHeaderOverride);
            displayTextInputStream(headerOverrideObject.getObjectContent());
        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 couldn't be contacted for a response, or the client
            // couldn't parse the response from Amazon S3.
            e.printStackTrace();
        } finally {
            // To ensure that the network connection doesn't remain open, close any
open input streams.
            if (fullObject != null) {
                fullObject.close();
            }
            if (objectPortion != null) {
                objectPortion.close();
            }
            if (headerOverrideObject != null) {
                headerOverrideObject.close();
            }
        }
    }

    private static void displayTextInputStream(InputStream input) throws IOException {
        // Read the text input stream one line at a time and display each line.
        BufferedReader reader = new BufferedReader(new InputStreamReader(input));
        String line = null;
```

```
        while ((line = reader.readLine()) != null) {
            System.out.println(line);
        }
        System.out.println();
    }
}
```

## Listing the objects in an Amazon S3 on Outposts bucket

Objects are the fundamental entities stored in Amazon S3 on Outposts. Every object is contained in a bucket. You must use access points to access any object in an Outpost bucket. When you specify the bucket for object operations, you use the access point Amazon Resource Name (ARN) or the access point alias. For more information about access point aliases, see Using a bucket-style alias for your S3 on Outposts bucket access point.

The following example shows the ARN format for S3 on Outposts access points, which includes the AWS Region code for the Region that the Outpost is homed to, the AWS account ID, the Outpost ID, and the access point name:

```
arn:aws:s3-outposts:region:account-id:outpost/outpost-id/accesspoint/accesspoint-name
```

For more information about S3 on Outposts ARNs, see Resource ARNs for S3 on Outposts.

> **Note**
>
> With Amazon S3 on Outposts, object data is always stored on the Outpost. When AWS installs an Outpost rack, your data stays local to your Outpost to meet data-residency requirements. Your objects never leave your Outpost and are not in an AWS Region. Because the AWS Management Console is hosted in-Region, you can't use the console to upload or manage objects in your Outpost. However, you can use the REST API, AWS Command Line Interface (AWS CLI), and AWS SDKs to upload and manage your objects through your access points.

The following examples show you how to list the objects in an S3 on Outposts bucket using the AWS CLI and AWS SDK for Java.

### Using the AWS CLI

The following example lists the objects in an S3 on Outposts bucket (`s3-outposts:ListObjectsV2`) by using the AWS CLI. To use this command, replace each *`user input placeholder`* with your own information. For more information about this command, see list-objects-v2 in the *AWS CLI Reference*.

```
aws s3api list-objects-v2 --bucket arn:aws:s3-
outposts:region:123456789012:outpost/op-01ac5d28a6a232904/accesspoint/example-outposts-
access-point
```

**Note**

When using this action with Amazon S3 on Outposts through the AWS SDKs, you provide the Outposts access point ARN in place of the bucket name, in the following form: `arn:aws:s3-outposts:region:123456789012:outpost/op-01ac5d28a6a232904/accesspoint/example-Outposts-Access-Point`. For more information about S3 on Outposts ARNs, see Resource ARNs for S3 on Outposts.

### Using the AWS SDK for Java

The following S3 on Outposts example lists objects in a bucket by using the SDK for Java. To use this example, replace each *`user input placeholder`* with your own information.

**Important**

This example uses ListObjectsV2, which is the latest revision of the `ListObjects` API operation. We recommend that you use this revised API operation for application development. For backward compatibility, Amazon S3 continues to support the prior version of this API operation.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.ListObjectsV2Request;
import com.amazonaws.services.s3.model.ListObjectsV2Result;
```

```
import com.amazonaws.services.s3.model.S3ObjectSummary;

public class ListObjectsV2 {

    public static void main(String[] args) {
        String accessPointArn = "*** access point ARN ***";

        try {
            // This code expects that you have AWS credentials set up per:
            // https://docs.aws.amazon.com/sdk-for-java/v1/developer-guide/setup-
credentials.html
            AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
                    .enableUseArnRegion()
                    .build();

            System.out.println("Listing objects");

            // maxKeys is set to 2 to demonstrate the use of
            // ListObjectsV2Result.getNextContinuationToken()
            ListObjectsV2Request req = new
 ListObjectsV2Request().withBucketName(accessPointArn).withMaxKeys(2);
            ListObjectsV2Result result;

            do {
                result = s3Client.listObjectsV2(req);

                for (S3ObjectSummary objectSummary : result.getObjectSummaries()) {
                    System.out.printf(" - %s (size: %d)\n", objectSummary.getKey(),
 objectSummary.getSize());
                }
                // If there are more than maxKeys keys in the bucket, get a
 continuation token
                // and list the next objects.
                String token = result.getNextContinuationToken();
                System.out.println("Next Continuation Token: " + token);
                req.setContinuationToken(token);
            } while (result.isTruncated());
        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 couldn't be contacted for a response, or the client
            // couldn't parse the response from Amazon S3.
```

```
            e.printStackTrace();
        }
    }
}
```

## Deleting objects in Amazon S3 on Outposts buckets

Objects are the fundamental entities stored in Amazon S3 on Outposts. Every object is contained in a bucket. You must use access points to access any object in an Outpost bucket. When you specify the bucket for object operations, you use the access point Amazon Resource Name (ARN) or the access point alias. For more information about access point aliases, see Using a bucket-style alias for your S3 on Outposts bucket access point.

The following example shows the ARN format for S3 on Outposts access points, which includes the AWS Region code for the Region that the Outpost is homed to, the AWS account ID, the Outpost ID, and the access point name:

```
arn:aws:s3-outposts:region:account-id:outpost/outpost-id/accesspoint/accesspoint-name
```

For more information about S3 on Outposts ARNs, see Resource ARNs for S3 on Outposts.

With Amazon S3 on Outposts, object data is always stored on the Outpost. When AWS installs an Outpost rack, your data stays local to your Outpost to meet data-residency requirements. Your objects never leave your Outpost and are not in an AWS Region. Because the AWS Management Console is hosted in-Region, you can't use the console to upload or manage objects in your Outpost. However, you can use the REST API, AWS Command Line Interface (AWS CLI), and AWS SDKs to upload and manage your objects through your access points.

The following examples show you how to delete a single object or multiple objects in an S3 on Outposts bucket by using the AWS Command Line Interface (AWS CLI) and AWS SDK for Java.

### Using the AWS CLI

The following examples show you how to delete a single object or multiple objects from an S3 on Outposts bucket.

delete-object

The following example deletes an object named `sample-object.xml` from an S3 on Outposts bucket (`s3-outposts:DeleteObject`) by using the AWS CLI. To use this command, replace each *`user input placeholder`* with your own information. For more information about this command, see delete-object in the *AWS CLI Reference*.

```
aws s3api delete-object --bucket arn:aws:s3-
outposts:region:123456789012:outpost/op-01ac5d28a6a232904/accesspoint/example-
outposts-access-point --key sample-object.xml
```

delete-objects

The following example deletes two objects named `sample-object.xml` and `test1.text` from an S3 on Outposts bucket (`s3-outposts:DeleteObject`) by using the AWS CLI. To use this command, replace each *`user input placeholder`* with your own information. For more information about this command, see delete-objects in the *AWS CLI Reference*.

```
aws s3api delete-objects --bucket arn:aws:s3-
outposts:region:123456789012:outpost/op-01ac5d28a6a232904/accesspoint/example-
outposts-access-point --delete file://delete.json

delete.json
{
  "Objects": [
    {
      "Key": "test1.txt"
    },
    {
      "Key": "sample-object.xml"
    }
  ],
  "Quiet": false
}
```

### Using the AWS SDK for Java

The following examples show you how to delete a single object or multiple objects from an S3 on Outposts bucket.

### DeleteObject

The following S3 on Outposts example deletes an object in a bucket by using the SDK for Java. To use this example, specify the access point ARN for the Outpost and the key name for the object that you want to delete. For more information, see DeleteObject in the *Amazon Simple Storage Service API Reference*.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.DeleteObjectRequest;

public class DeleteObject {
    public static void main(String[] args) {
        String accessPointArn = "*** access point ARN ***";
        String keyName = "*** key name ****";

        try {
            // This code expects that you have AWS credentials set up per:
            // https://docs.aws.amazon.com/sdk-for-java/v1/developer-guide/setup-
credentials.html
            AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
                    .enableUseArnRegion()
                    .build();

            s3Client.deleteObject(new DeleteObjectRequest(accessPointArn, keyName));
        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 couldn't be contacted for a response, or the client
            // couldn't parse the response from Amazon S3.
            e.printStackTrace();
        }
    }
}
```

### DeleteObjects

The following S3 on Outposts example uploads and then deletes objects in a bucket by using the SDK for Java. To use this example, specify the access point ARN for the Outpost. For more information, see DeleteObjects in the *Amazon Simple Storage Service API Reference*.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.DeleteObjectsRequest;
import com.amazonaws.services.s3.model.DeleteObjectsRequest.KeyVersion;
import com.amazonaws.services.s3.model.DeleteObjectsResult;

import java.util.ArrayList;

public class DeleteObjects {

    public static void main(String[] args) {
       String accessPointArn = "arn:aws:s3-
outposts:region:123456789012:outpost/op-01ac5d28a6a232904/accesspoint/example-
outposts-access-point";

        try {
            // This code expects that you have AWS credentials set up per:
            // https://docs.aws.amazon.com/sdk-for-java/v1/developer-guide/setup-
credentials.html
            AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
                    .enableUseArnRegion()
                    .build();

            // Upload three sample objects.
            ArrayList<KeyVersion> keys = new ArrayList<KeyVersion>();
            for (int i = 0; i < 3; i++) {
                String keyName = "delete object example " + i;
                s3Client.putObject(accessPointArn, keyName, "Object number " + i + "
 to be deleted.");
                keys.add(new KeyVersion(keyName));
            }
            System.out.println(keys.size() + " objects successfully created.");

            // Delete the sample objects.
```

```
            DeleteObjectsRequest multiObjectDeleteRequest = new
 DeleteObjectsRequest(accessPointArn)
                    .withKeys(keys)
                    .withQuiet(false);

            // Verify that the objects were deleted successfully.
            DeleteObjectsResult delObjRes =
 s3Client.deleteObjects(multiObjectDeleteRequest);
            int successfulDeletes = delObjRes.getDeletedObjects().size();
            System.out.println(successfulDeletes + " objects successfully
 deleted.");
        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 couldn't be contacted for a response, or the client
            // couldn't parse the response from Amazon S3.
            e.printStackTrace();
        }
    }
}
```

## Using HeadBucket to determine if an S3 on Outposts bucket exists and you have access permissions

Objects are the fundamental entities stored in Amazon S3 on Outposts. Every object is contained in a bucket. You must use access points to access any object in an Outpost bucket. When you specify the bucket for object operations, you use the access point Amazon Resource Name (ARN) or the access point alias. For more information about access point aliases, see Using a bucket-style alias for your S3 on Outposts bucket access point.

The following example shows the ARN format for S3 on Outposts access points, which includes the AWS Region code for the Region that the Outpost is homed to, the AWS account ID, the Outpost ID, and the access point name:

```
arn:aws:s3-outposts:region:account-id:outpost/outpost-id/accesspoint/accesspoint-name
```

For more information about S3 on Outposts ARNs, see Resource ARNs for S3 on Outposts.

**Note**

With Amazon S3 on Outposts, object data is always stored on the Outpost. When AWS installs an Outpost rack, your data stays local to your Outpost to meet data-residency requirements. Your objects never leave your Outpost and are not in an AWS Region. Because the AWS Management Console is hosted in-Region, you can't use the console to upload or manage objects in your Outpost. However, you can use the REST API, AWS Command Line Interface (AWS CLI), and AWS SDKs to upload and manage your objects through your access points.

The following AWS Command Line Interface (AWS CLI) and AWS SDK for Java examples show you how to use the HeadBucket API operation to determine if an Amazon S3 on Outposts bucket exists and whether you have permission to access it. For more information, see HeadBucket in the *Amazon Simple Storage Service API Reference*.

### Using the AWS CLI

The following S3 on Outposts AWS CLI example uses the `head-bucket` command to determine if a bucket exists and you have permissions to access it. To use this command, replace each *`user input placeholder`* with your own information. For more information about this command, see head-bucket in the *AWS CLI Reference*.

```
aws s3api head-bucket --bucket arn:aws:s3-
outposts:region:123456789012:outpost/op-01ac5d28a6a232904/accesspoint/example-outposts-
access-point
```

### Using the AWS SDK for Java

The following S3 on Outposts example shows how to determine if a bucket exists and if you have permission to access it. To use this example, specify the access point ARN for the Outpost. For more information, see HeadBucket in the *Amazon Simple Storage Service API Reference*.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.HeadBucketRequest;

public class HeadBucket {
```

```
    public static void main(String[] args) {
        String accessPointArn = "*** access point ARN ***";

        try {
            // This code expects that you have AWS credentials set up per:
            // https://docs.aws.amazon.com/sdk-for-java/v1/developer-guide/setup-
credentials.html
            AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
                    .enableUseArnRegion()
                    .build();

            s3Client.headBucket(new HeadBucketRequest(accessPointArn));
        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 couldn't be contacted for a response, or the client
            // couldn't parse the response from Amazon S3.
            e.printStackTrace();
        }
    }
}
```

## Performing and managing a multipart upload with the SDK for Java

With Amazon S3 on Outposts, you can create S3 buckets on your AWS Outposts resources and store and retrieve objects on-premises for applications that require local data access, local data processing, and data residency. You can use S3 on Outposts through the AWS Management Console, AWS Command Line Interface (AWS CLI), AWS SDKs, or REST API. For more information, see What is Amazon S3 on Outposts?

The following examples show how you can use S3 on Outposts with the AWS SDK for Java to perform and manage a multipart upload.

### Topics

- Perform a multipart upload of an object in an S3 on Outposts bucket
- Copy a large object in an S3 on Outposts bucket by using multipart upload
- List parts of an object in an S3 on Outposts bucket
- Retrieve a list of in-progress multipart uploads in an S3 on Outposts bucket

## Perform a multipart upload of an object in an S3 on Outposts bucket

The following S3 on Outposts example initiates, uploads, and finishes a multipart upload of an object to a bucket by using the SDK for Java. To use this example, replace each *user input placeholder* with your own information. For more information, see Uploading an object using multipart upload.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.*;

import java.util.ArrayList;
import java.util.List;

public class MultipartUploadCopy {
    public static void main(String[] args) {
        String accessPointArn = "*** Source access point ARN ***";
        String sourceObjectKey = "*** Source object key ***";
        String destObjectKey = "*** Target object key ***";

        try {
            // This code expects that you have AWS credentials set up per:
            // https://docs.aws.amazon.com/sdk-for-java/v1/developer-guide/setup-
credentials.html
            AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
                    .enableUseArnRegion()
                    .build();

            // Initiate the multipart upload.
            InitiateMultipartUploadRequest initRequest = new
 InitiateMultipartUploadRequest(accessPointArn, destObjectKey);
            InitiateMultipartUploadResult initResult =
 s3Client.initiateMultipartUpload(initRequest);

            // Get the object size to track the end of the copy operation.
            GetObjectMetadataRequest metadataRequest = new
 GetObjectMetadataRequest(accessPointArn, sourceObjectKey);
            ObjectMetadata metadataResult =
 s3Client.getObjectMetadata(metadataRequest);
            long objectSize = metadataResult.getContentLength();
```

```
            // Copy the object using 5 MB parts.
            long partSize = 5 * 1024 * 1024;
            long bytePosition = 0;
            int partNum = 1;
            List<CopyPartResult> copyResponses = new ArrayList<CopyPartResult>();
            while (bytePosition < objectSize) {
                // The last part might be smaller than partSize, so check to make sure
                // that lastByte isn't beyond the end of the object.
                long lastByte = Math.min(bytePosition + partSize - 1, objectSize - 1);

                // Copy this part.
                CopyPartRequest copyRequest = new CopyPartRequest()
                        .withSourceBucketName(accessPointArn)
                        .withSourceKey(sourceObjectKey)
                        .withDestinationBucketName(accessPointArn)
                        .withDestinationKey(destObjectKey)
                        .withUploadId(initResult.getUploadId())
                        .withFirstByte(bytePosition)
                        .withLastByte(lastByte)
                        .withPartNumber(partNum++);
                copyResponses.add(s3Client.copyPart(copyRequest));
                bytePosition += partSize;
            }

            // Complete the upload request to concatenate all uploaded parts and make
the copied object available.
            CompleteMultipartUploadRequest completeRequest = new
CompleteMultipartUploadRequest(
                    accessPointArn,
                    destObjectKey,
                    initResult.getUploadId(),
                    getETags(copyResponses));
            s3Client.completeMultipartUpload(completeRequest);
            System.out.println("Multipart copy complete.");
        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 couldn't be contacted for a response, or the client
            // couldn't parse the response from Amazon S3.
            e.printStackTrace();
        }
    }
```

```
    // This is a helper function to construct a list of ETags.
    private static List<PartETag> getETags(List<CopyPartResult> responses) {
        List<PartETag> etags = new ArrayList<PartETag>();
        for (CopyPartResult response : responses) {
            etags.add(new PartETag(response.getPartNumber(), response.getETag()));
        }
        return etags;
    }
```

## Copy a large object in an S3 on Outposts bucket by using multipart upload

The following S3 on Outposts example uses the SDK for Java to copy an object in a bucket. To use this example, replace each *user input placeholder* with your own information. This example is adapted from Copying an object using multipart upload.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.*;

import java.util.ArrayList;
import java.util.List;

public class MultipartUploadCopy {
    public static void main(String[] args) {
        String accessPointArn = "*** Source access point ARN ***";
        String sourceObjectKey = "*** Source object key ***";
        String destObjectKey = "*** Target object key ***";

        try {
            // This code expects that you have AWS credentials set up per:
            // https://docs.aws.amazon.com/sdk-for-java/v1/developer-guide/setup-
credentials.html
            AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
                    .enableUseArnRegion()
                    .build();

            // Initiate the multipart upload.
            InitiateMultipartUploadRequest initRequest = new
 InitiateMultipartUploadRequest(accessPointArn, destObjectKey);
```

```
            InitiateMultipartUploadResult initResult =
s3Client.initiateMultipartUpload(initRequest);

            // Get the object size to track the end of the copy operation.
            GetObjectMetadataRequest metadataRequest = new
GetObjectMetadataRequest(accessPointArn, sourceObjectKey);
            ObjectMetadata metadataResult =
s3Client.getObjectMetadata(metadataRequest);
            long objectSize = metadataResult.getContentLength();

            // Copy the object using 5 MB parts.
            long partSize = 5 * 1024 * 1024;
            long bytePosition = 0;
            int partNum = 1;
            List<CopyPartResult> copyResponses = new ArrayList<CopyPartResult>();
            while (bytePosition < objectSize) {
                // The last part might be smaller than partSize, so check to make sure
                // that lastByte isn't beyond the end of the object.
                long lastByte = Math.min(bytePosition + partSize - 1, objectSize - 1);

                // Copy this part.
                CopyPartRequest copyRequest = new CopyPartRequest()
                        .withSourceBucketName(accessPointArn)
                        .withSourceKey(sourceObjectKey)
                        .withDestinationBucketName(accessPointArn)
                        .withDestinationKey(destObjectKey)
                        .withUploadId(initResult.getUploadId())
                        .withFirstByte(bytePosition)
                        .withLastByte(lastByte)
                        .withPartNumber(partNum++);
                copyResponses.add(s3Client.copyPart(copyRequest));
                bytePosition += partSize;
            }

            // Complete the upload request to concatenate all uploaded parts and make
the copied object available.
            CompleteMultipartUploadRequest completeRequest = new
CompleteMultipartUploadRequest(
                    accessPointArn,
                    destObjectKey,
                    initResult.getUploadId(),
                    getETags(copyResponses));
            s3Client.completeMultipartUpload(completeRequest);
            System.out.println("Multipart copy complete.");
```

```
        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 couldn't be contacted for a response, or the client
            // couldn't parse the response from Amazon S3.
            e.printStackTrace();
        }
    }

    // This is a helper function to construct a list of ETags.
    private static List<PartETag> getETags(List<CopyPartResult> responses) {
        List<PartETag> etags = new ArrayList<PartETag>();
        for (CopyPartResult response : responses) {
            etags.add(new PartETag(response.getPartNumber(), response.getETag()));
        }
        return etags;
    }
}
```

## List parts of an object in an S3 on Outposts bucket

The following S3 on Outposts example lists the parts of an object in a bucket by using the SDK for Java. To use this example, replace each *`user input placeholder`* with your own information.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.*;

import java.util.List;

public class ListParts {
    public static void main(String[] args) {
        String accessPointArn = "*** access point ARN ***";
        String keyName = "*** Key name ***";
        String uploadId = "*** Upload ID ***";

        try {
            // This code expects that you have AWS credentials set up per:
```

```
            // https://docs.aws.amazon.com/sdk-for-java/v1/developer-guide/setup-
credentials.html
            AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
                    .enableUseArnRegion()
                    .build();

            ListPartsRequest listPartsRequest = new ListPartsRequest(accessPointArn,
 keyName, uploadId);
            PartListing partListing = s3Client.listParts(listPartsRequest);
            List<PartSummary> partSummaries = partListing.getParts();

            System.out.println(partSummaries.size() + " multipart upload parts");
            for (PartSummary p : partSummaries) {
                System.out.println("Upload part: Part number = \"" + p.getPartNumber()
 + "\", ETag = " + p.getETag());
            }

        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 couldn't be contacted for a response, or the client
            // couldn't parse the response from Amazon S3.
            e.printStackTrace();
        }
    }
}
```

## Retrieve a list of in-progress multipart uploads in an S3 on Outposts bucket

The following S3 on Outposts example shows how to retrieve a list of the in-progress multipart uploads from an Outposts bucket by using the SDK for Java. To use this example, replace each *`user input placeholder`* with your own information. This example is adapted from the Listing multipart uploads example for Amazon S3.

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import com.amazonaws.services.s3.AmazonS3;
import com.amazonaws.services.s3.AmazonS3ClientBuilder;
import com.amazonaws.services.s3.model.ListMultipartUploadsRequest;
import com.amazonaws.services.s3.model.MultipartUpload;
import com.amazonaws.services.s3.model.MultipartUploadListing;
```

```
import java.util.List;

public class ListMultipartUploads {
    public static void main(String[] args) {
                String accessPointArn = "*** access point ARN ***";

        try {
            // This code expects that you have AWS credentials set up per:
            // https://docs.aws.amazon.com/sdk-for-java/v1/developer-guide/setup-
credentials.html
            AmazonS3 s3Client = AmazonS3ClientBuilder.standard()
                    .enableUseArnRegion()
                    .build();

            // Retrieve a list of all in-progress multipart uploads.
            ListMultipartUploadsRequest allMultipartUploadsRequest = new
 ListMultipartUploadsRequest(accessPointArn);
            MultipartUploadListing multipartUploadListing =
 s3Client.listMultipartUploads(allMultipartUploadsRequest);
            List<MultipartUpload> uploads =
 multipartUploadListing.getMultipartUploads();

            // Display information about all in-progress multipart uploads.
            System.out.println(uploads.size() + " multipart upload(s) in progress.");
            for (MultipartUpload u : uploads) {
                System.out.println("Upload in progress: Key = \"" + u.getKey() + "\",
 id = " + u.getUploadId());
            }
        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 couldn't be contacted for a response, or the client
            // couldn't parse the response from Amazon S3.
            e.printStackTrace();
        }
    }
}
```

# Using presigned URLs for S3 on Outposts

To grant time-limited access to objects that are stored locally on an Outpost without updating your bucket policy, you can use a presigned URL. With presigned URLs, you as the bucket owner can share objects with individuals in your virtual private cloud (VPC) or grant them the ability to upload or delete objects.

When you create a presigned URL by using the AWS SDKs or the AWS Command Line Interface (AWS CLI), you associate the URL with a specific action. You also grant time-limited access to the presigned URL by choosing a custom expiration time that can be as low as 1 second and as high as 7 days. When you share the presigned URL, the individual in the VPC can perform the action embedded in the URL as if they were the original signing user. When the URL reaches its expiration time, the URL expires and no longer works.

## Limiting presigned URL capabilities

The capabilities of a presigned URL are limited by the permissions of the user who created it. In essence, presigned URLs are bearer tokens that grant access to those who possess them. As such, we recommend that you protect them appropriately.

### AWS Signature Version 4 (SigV4)

To enforce specific behavior when presigned URL requests are authenticated by using AWS Signature Version 4 (SigV4), you can use condition keys in bucket policies and access point policies. For example, you can create a bucket policy that uses the `s3-outposts:signatureAge` condition to deny any Amazon S3 on Outposts presigned URL request on objects in the `example-outpost-bucket` bucket if the signature is more than 10 minutes old. To use this example, replace the *`user input placeholders`* with your own information.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Deny a presigned URL request if the signature is more than 10
 minutes old",
            "Effect": "Deny",
            "Principal": {"AWS":"444455556666"},
            "Action": "s3-outposts:*",
            "Resource": "arn:aws:s3-outposts:us-
east-1:111122223333:outpost/op-01ac5d28a6a232904/bucket/example-outpost-bucket/object/
*",
```

```
            "Condition": {
                "NumericGreaterThan": {"s3-outposts:signatureAge": 600000},
                "StringEquals": {"s3-outposts:authType": "REST-QUERY-STRING"}
            }
        }
    ]
}
```

For a list of condition keys and additional example policies that you can use to enforce specific behavior when presigned URL requests are authenticated by using Signature Version 4, see AWS Signature Version 4 (SigV4) authentication-specific policy keys.

**Network path restriction**

If you want to restrict the use of presigned URLs and all S3 on Outposts access to particular network paths, you can write policies that require a particular network path. To set the restriction on the IAM principal that makes the call, you can use identity-based AWS Identity and Access Management (IAM) policies (for example, user, group, or role policies). To set the restriction on the S3 on Outposts resource, you can use resource-based policies (for example, bucket and access point policies).

A network-path restriction on the IAM principal requires the user of those credentials to make requests from the specified network. A restriction on the bucket or access point requires that all requests to that resource originate from the specified network. These restrictions also apply outside of the presigned URL scenario.

The IAM global condition that you use depends on the type of endpoint. If you are using the public endpoint for S3 on Outposts, use `aws:SourceIp`. If you are using a VPC endpoint for S3 on Outposts, use `aws:SourceVpc` or `aws:SourceVpce`.

The following IAM policy statement requires the principal to access AWS only from the specified network range. With this policy statement, all access must originate from that range. This includes the case of someone who's using a presigned URL for S3 on Outposts. To use this example, replace the *`user input placeholders`* with your own information.

```
{
    "Sid": "NetworkRestrictionForIAMPrincipal",
    "Effect": "Deny",
    "Action": "*",
    "Resource": "*",
```

```
    "Condition": {
        "NotIpAddressIfExists": {"aws:SourceIp": "IP-address-range"},
        "BoolIfExists": {"aws:ViaAWSService": "false"}
    }
}
```

For an example bucket policy that uses the `aws:SourceIP` AWS global condition key to restrict access to an S3 on Outposts bucket to a specific network range, see Setting up IAM with S3 on Outposts.

## Who can create a presigned URL

Anyone with valid security credentials can create a presigned URL. But for a user in the VPC to successfully access an object, the presigned URL must be created by someone who has permission to perform the operation that the presigned URL is based upon.

You can use the following credentials to create a presigned URL:

- **IAM instance profile** – Valid up to 6 hours.
- **AWS Security Token Service** – Valid up to 36 hours when signed with permanent credentials, such as the credentials of the AWS account root user or an IAM user.
- **IAM user** – Valid up to 7 days when you're using AWS Signature Version 4.

  To create a presigned URL that's valid for up to 7 days, first delegate IAM user credentials (the access key and secret key) to the SDK that you're using. Then, generate a presigned URL by using AWS Signature Version 4.

**Note**

- If you created a presigned URL by using a temporary token, the URL expires when the token expires, even if you created the URL with a later expiration time.
- Because presigned URLs grant access to your S3 on Outposts buckets to whoever has the URL, we recommend that you protect them appropriately. For more information about protecting presigned URLs, see Limiting presigned URL capabilities.

## When does S3 on Outposts check the expiration date and time of a presigned URL?

At the time of the HTTP request, S3 on Outposts checks the expiration date and time of a signed URL. For example, if a client begins to download a large file immediately before the expiration time, the download continues even if the expiration time passes during the download. However, if the connection drops and the client tries to restart the download after the expiration time passes, the download fails.

For more information about using a presigned URL to share or upload objects, see the following topics.

**Topics**

- Sharing objects by using presigned URLs
- Generating a presigned URL to upload an object to an S3 on Outposts bucket

## Sharing objects by using presigned URLs

To grant time-limited access to objects that are stored locally on an Outpost without updating your bucket policy, you can use a presigned URL. With presigned URLs, you as the bucket owner can share objects with individuals in your virtual private cloud (VPC) or grant them the ability to upload or delete objects.

When you create a presigned URL by using the AWS SDKs or the AWS Command Line Interface (AWS CLI), you associate the URL with a specific action. You also grant time-limited access to the presigned URL by choosing a custom expiration time that can be as low as 1 second and as high as 7 days. When you share the presigned URL, the individual in the VPC can perform the action embedded in the URL as if they were the original signing user. When the URL reaches its expiration time, the URL expires and no longer works.

When you create a presigned URL, you must provide your security credentials, and then specify the following:

- An access point Amazon Resource Name (ARN) for the Amazon S3 on Outposts bucket
- An object key
- An HTTP method (GET for downloading objects)
- An expiration date and time

A presigned URL is valid only for the specified duration. That is, you must start the action that's allowed by the URL before the expiration date and time. You can use a presigned URL multiple times, up to the expiration date and time. If you created a presigned URL by using a temporary token, then the URL expires when the token expires, even if you created the URL with a later expiration time.

Users in the virtual private cloud (VPC) who have access to the presigned URL can access the object. For example, if you have a video in your bucket and both the bucket and the object are private, you can share the video with others by generating a presigned URL. Because presigned URLs grant access to your S3 on Outposts buckets to whoever has the URL, we recommend that you protect these URLs appropriately. For more details about protecting presigned URLs, see Limiting presigned URL capabilities.

Anyone with valid security credentials can create a presigned URL. However, the presigned URL must be created by someone who has permission to perform the operation that the presigned URL is based upon. For more information, see Who can create a presigned URL.

You can generate a presigned URL to share an object in an S3 on Outposts bucket by using the AWS SDKs and the AWS CLI. For more information, see the following examples.

**Using the AWS SDKs**

You can use the AWS SDKs to generate a presigned URL that you can give to others so that they can retrieve an object.

> **Note**
>
> When you use the AWS SDKs to generate a presigned URL, the maximum expiration time for a presigned URL is 7 days from the time of creation.

Java

**Example**

The following example generates a presigned URL that you can give to others so that they can retrieve an object from an S3 on Outposts bucket. For more information, see Using presigned URLs for S3 on Outposts. To use this example, replace the *`user input placeholders`* with your own information.

For instructions on creating and testing a working sample, see Getting Started in the AWS SDK for Java Developer Guide.

            catch (Exception e)
            {
                Console.WriteLine("Unknown encountered on server. Message:'{0}' when
 writing an object", e.Message);
            }
            return urlString;
        }
    }
}
```

Python

The following example generates a presigned URL to share an object by using the SDK for Python (Boto3). For example, use a Boto3 client and the `generate_presigned_url` function to generate a presigned URL that allows you to `GET` an object.

```
import boto3
    url = boto3.client('s3').generate_presigned_url(
    ClientMethod='get_object',
```

```
    Params={'Bucket': 'ACCESS_POINT_ARN', 'Key': 'OBJECT_KEY'},
    ExpiresIn=3600)
```

For more information about using the SDK for Python (Boto3) to generate a presigned URL, see Python in the *AWS SDK for Python (Boto) API Reference*.

#### Using the AWS CLI

The following example AWS CLI command generates a presigned URL for an S3 on Outposts bucket. To use this example, replace the *`user input placeholders`* with your own information.

> **Note**
>
> When you use the AWS CLI to generate a presigned URL, the maximum expiration time for a presigned URL is 7 days from the time of creation.

```
aws s3 presign s3://arn:aws:s3-outposts:us-
east-1:111122223333:outpost/op-01ac5d28a6a232904/accesspoint/example-outpost-access-
point/mydoc.txt --expires-in 604800
```

For more information, see presign in the *AWS CLI Command Reference*.

### Generating a presigned URL to upload an object to an S3 on Outposts bucket

To grant time-limited access to objects that are stored locally on an Outpost without updating your bucket policy, you can use a presigned URL. With presigned URLs, you as the bucket owner can share objects with individuals in your virtual private cloud (VPC) or grant them the ability to upload or delete objects.

When you create a presigned URL by using the AWS SDKs or the AWS Command Line Interface (AWS CLI), you associate the URL with a specific action. You also grant time-limited access to the presigned URL by choosing a custom expiration time that can be as low as 1 second and as high as 7 days. When you share the presigned URL, the individual in the VPC can perform the action embedded in the URL as if they were the original signing user. When the URL reaches its expiration time, the URL expires and no longer works.

When you create a presigned URL, you must provide your security credentials, and then specify the following:

- An access point Amazon Resource Name (ARN) for the Amazon S3 on Outposts bucket
- An object key
- An HTTP method (PUT for uploading objects)
- An expiration date and time

A presigned URL is valid only for the specified duration. That is, you must start the action that's allowed by the URL before the expiration date and time. You can use a presigned URL multiple times, up to the expiration date and time. If you created a presigned URL by using a temporary token, then the URL expires when the token expires, even if you created the URL with a later expiration time.

If the action allowed by a presigned URL consists of multiple steps, such as a multipart upload, you must start all steps before the expiration time. If S3 on Outposts tries to start a step with an expired URL, you receive an error.

Users in the virtual private cloud (VPC) who have access to the presigned URL can upload objects. For example, a user in the VPC who has access to the presigned URL can upload an object to your bucket. Because presigned URLs grant access to your S3 on Outposts bucket to any user in the VPC who has access to the presigned URL, we recommend that you protect these URLs appropriately. For more details about protecting presigned URLs, see Limiting presigned URL capabilities.

Anyone with valid security credentials can create a presigned URL. However, the presigned URL must be created by someone who has permission to perform the operation that the presigned URL is based upon. For more information, see Who can create a presigned URL.

**Using the AWS SDKs to generate a presigned URL for an S3 on Outposts object operation**

Java

**SDK for Java 2.x**

This example shows how to generate a presigned URL that you can use to upload an object to an S3 on Outposts bucket for a limited time. For more information, see Using presigned URLs for S3 on Outposts.

```
   public static void signBucket(S3Presigner presigner, String
outpostAccessPointArn, String keyName) {

       try {
```

```
            PutObjectRequest objectRequest = PutObjectRequest.builder()
                    .bucket(accessPointArn)
                    .key(keyName)
                    .contentType("text/plain")
                    .build();

            PutObjectPresignRequest presignRequest =
PutObjectPresignRequest.builder()
                    .signatureDuration(Duration.ofMinutes(10))
                    .putObjectRequest(objectRequest)
                    .build();

            PresignedPutObjectRequest presignedRequest =
presigner.presignPutObject(presignRequest);

            String myURL = presignedRequest.url().toString();
            System.out.println("Presigned URL to upload a file to: " +myURL);
            System.out.println("Which HTTP method must be used when uploading a
file: " +
                    presignedRequest.httpRequest().method());

            // Upload content to the S3 on Outposts bucket by using this URL.
            URL url = presignedRequest.url();

            // Create the connection and use it to upload the new object by using
the presigned URL.
            HttpURLConnection connection = (HttpURLConnection)
url.openConnection();
            connection.setDoOutput(true);
            connection.setRequestProperty("Content-Type","text/plain");
            connection.setRequestMethod("PUT");
            OutputStreamWriter out = new
OutputStreamWriter(connection.getOutputStream());
            out.write("This text was uploaded as an object by using a presigned
URL.");
            out.close();

            connection.getResponseCode();
            System.out.println("HTTP response code is " +
connection.getResponseCode());

        } catch (S3Exception e) {
            e.getStackTrace();
```

```
        } catch (IOException e) {
            e.getStackTrace();
        }
    }
```

Python

**SDK for Python (Boto3)**

This example shows how to generate a presigned URL that can perform an S3 on Outposts action for a limited time. For more information, see Using presigned URLs for S3 on Outposts. To make a request with the URL, use the `Requests` package.

```
import argparse
import logging
import boto3
from botocore.exceptions import ClientError
import requests

logger = logging.getLogger(__name__)

def generate_presigned_url(s3_client, client_method, method_parameters,
 expires_in):
    """
    Generate a presigned S3 on Outposts URL that can be used to perform an
 action.

    :param s3_client: A Boto3 Amazon S3 client.
    :param client_method: The name of the client method that the URL performs.
    :param method_parameters: The parameters of the specified client method.
    :param expires_in: The number of seconds that the presigned URL is valid for.
    :return: The presigned URL.
    """
    try:
        url = s3_client.generate_presigned_url(
            ClientMethod=client_method,
            Params=method_parameters,
            ExpiresIn=expires_in
        )
        logger.info("Got presigned URL: %s", url)
    except ClientError:
```

```
        logger.exception(
            "Couldn't get a presigned URL for client method '%s'.",
 client_method)
        raise
    return url

def usage_demo():
    logging.basicConfig(level=logging.INFO, format='%(levelname)s: %(message)s')

    print('-'*88)
    print("Welcome to the Amazon S3 on Outposts presigned URL demo.")
    print('-'*88)

    parser = argparse.ArgumentParser()
    parser.add_argument('accessPointArn', help="The name of the S3 on Outposts
 access point ARN.")
    parser.add_argument(
        'key', help="For a GET operation, the key of the object in S3 on
 Outposts. For a "
                    "PUT operation, the name of a file to upload.")
    parser.add_argument(
        'action', choices=('get', 'put'), help="The action to perform.")
    args = parser.parse_args()

    s3_client = boto3.client('s3')
    client_action = 'get_object' if args.action == 'get' else 'put_object'
    url = generate_presigned_url(
        s3_client, client_action, {'Bucket': args.accessPointArn, 'Key':
 args.key}, 1000)

    print("Using the Requests package to send a request to the URL.")
    response = None
    if args.action == 'get':
        response = requests.get(url)
    elif args.action == 'put':
        print("Putting data to the URL.")
        try:
            with open(args.key, 'r') as object_file:
                object_text = object_file.read()
            response = requests.put(url, data=object_text)
        except FileNotFoundError:
            print(f"Couldn't find {args.key}. For a PUT operation, the key must
 be the "
```

```
                    f"name of a file that exists on your computer.")

    if response is not None:
        print("Got response:")
        print(f"Status: {response.status_code}")
        print(response.text)

    print('-'*88)

if __name__ == '__main__':
    usage_demo()
```

## Amazon S3 on Outposts with local Amazon EMR on Outposts

Amazon EMR is a managed cluster platform that simplifies running big data frameworks, such as Apache Hadoop and Apache Spark, on AWS to process and analyze vast amounts of data. By using these frameworks and related open-source projects, you can process data for analytics purposes and business intelligence workloads. Amazon EMR also helps you transform and move large amounts of data into and out of other AWS data stores and databases, and supports Amazon S3 on Outposts. For more information about Amazon EMR, see Amazon EMR on Outposts in the *Amazon EMR Management Guide*.

For Amazon S3 on Outposts, Amazon EMR started to support the Apache Hadoop S3A connector in version 7.0.0. Earlier versions of Amazon EMR don't support local S3 on Outposts, and the EMR File System (EMRFS) is not supported.

### Supported applications

Amazon EMR with Amazon S3 on Outposts supports the following applications:

- Hadoop
- Spark
- Hue
- Hive
- Sqoop
- Pig
- Hudi

- Flink

For more information, see the Amazon EMR Release Guide.

## Create and configure an Amazon S3 on Outposts bucket

Amazon EMR uses the AWS SDK for Java with Amazon S3 on Outposts to store input data and output data. Your Amazon EMR log files are stored in a Regional Amazon S3 location that you select and aren't stored locally on the Outpost. For more information, see Amazon EMR logs in the *Amazon EMR Management Guide*.

To conform with Amazon S3 and DNS requirements, S3 on Outposts buckets have naming restrictions and limitations. For more information, see Creating an S3 on Outposts bucket.

With Amazon EMR version 7.0.0 and later, you can use Amazon EMR with S3 on Outposts and the S3A file system.

**Prerequisites**

**S3 on Outposts permissions** – When you create your Amazon EMR instance profile, your role must contain the AWS Identity and Access Management (IAM) namespace for S3 on Outposts. S3 on Outposts has its own namespace, `s3-outposts*`. For an example policy that uses this namespace, see Setting up IAM with S3 on Outposts.

**S3A connector** – To configure your EMR cluster to access data from an Amazon S3 on Outposts bucket, you must use the Apache Hadoop S3A connector. To use the connector, ensure that all of your S3 URIs use the `s3a` scheme. If they don't, you can configure the file system implementation that you use for your EMR cluster so that your S3 URIs work with the S3A connector.

To configure the file system implementation to work with the S3A connector, you use the `fs.`*`file_scheme`*`.impl` and `fs.AbstractFileSystem.`*`file_scheme`*`.impl` configuration properties for your EMR cluster, where *`file_scheme`* corresponds to the type of S3 URIs that you have. To use the following example, replace the *`user input placeholders`* with your own information. For example, to change the file system implementation for S3 URIs that use the `s3` scheme, specify the following cluster configuration properties:

```
[
  {
"Classification": "core-site",
    "Properties": {
    "fs.s3.impl": "org.apache.hadoop.fs.s3a.S3AFileSystem",
```

```
    "fs.AbstractFileSystem.s3.impl": "org.apache.hadoop.fs.s3a.S3A"
    }
  }
]
```

To use S3A, set the `fs.file_scheme.impl` configuration property to `org.apache.hadoop.fs.s3a.S3AFileSystem`, and set the `fs.AbstractFileSystem.file_scheme.impl` property to `org.apache.hadoop.fs.s3a.S3A`.

For example, if you are accessing the path `s3a://bucket/...`, set the `fs.s3a.impl` property to `org.apache.hadoop.fs.s3a.S3AFileSystem`, and set the `fs.AbstractFileSystem.s3a.impl` property to `org.apache.hadoop.fs.s3a.S3A`.

## Getting started using Amazon EMR with Amazon S3 on Outposts

The following topics explain how to get started using Amazon EMR with Amazon S3 on Outposts.

**Topics**

### Create a permissions policy

Before you can create an EMR cluster that uses Amazon S3 on Outposts, you must create an IAM policy to attach to the Amazon EC2 instance profile for the cluster. The policy must have permissions to access the S3 on Outposts access point Amazon Resource Name (ARN). For more information about creating IAM policies for S3 on Outposts, see Setting up IAM with S3 on Outposts.

The following example policy shows how to grant the required permissions. After you create the policy, attach the policy to the instance profile role that you use to create your EMR cluster, as described in the the section called “Create and configure your cluster” section. To use this example, replace the *user input placeholders* with your own information.

```
{
```

```
"Version":"2012-10-17",
  "Statement": [
        {
  "Effect": "Allow",
            "Resource": "arn:aws:s3-outposts:us-
west-2:111122223333:outpost/op-01ac5d28a6a232904/accesspoint/access-point-name,
            "Action": [
                "s3-outposts:*"
            ]
        }
    ]

 }
```

### Create and configure your cluster

To create a cluster that runs Spark with S3 on Outposts, complete the following steps in the console.

#### To create a cluster that runs Spark with S3 on Outposts

1. Open the Amazon EMR console at https://console.aws.amazon.com/elasticmapreduce/.
2. In the left navigation pane, choose **Clusters**.
3. Choose **Create cluster**.
4. For **Amazon EMR release**, choose **emr-7.0.0** or later.
5. For Application bundle, choose **Spark interactive**. Then select any other supported applications that you want to be included in your cluster.
6. To enable Amazon S3 on Outposts, enter your configuration settings.

   **Sample configuration settings**

   To use the following sample configuration settings, replace the *user input placeholders* with your own information.

   ```
   [
    {
      "Classification": "core-site",
      "Properties": {
        "fs.s3a.bucket.DOC-EXAMPLE-BUCKET.accesspoint.arn": "arn:aws:s3-outposts:us-
   west-2:111122223333:outpost/op-01ac5d28a6a232904/accesspoint/access-point-name"
   ```

```
     "fs.s3a.committer.name": "magic",
     "fs.s3a.select.enabled": "false"
    }
  },
  {
    "Classification": "hadoop-env",
    "Configurations": [
      {
        "Classification": "export",
        "Properties": {
          "JAVA_HOME": "/usr/lib/jvm/java-11-amazon-corretto.x86_64"
         }
       }
     ],
     "Properties": {}
   },
   {
     "Classification": "spark-env",
     "Configurations": [
       {
         "Classification": "export",
         "Properties": {
           "JAVA_HOME": "/usr/lib/jvm/java-11-amazon-corretto.x86_64"
         }
       }
      ],
      "Properties": {}
     },
     {
      "Classification": "spark-defaults",
      "Properties": {
        "spark.executorEnv.JAVA_HOME": "/usr/lib/jvm/java-11-amazon-
corretto.x86_64",
        "spark.sql.sources.fastS3PartitionDiscovery.enabled": "false"
      }
     }
  ]
```

7. In the **Networking** section, choose a virtual private cloud (VPC) and subnet that are on your AWS Outposts rack. For more information about Amazon EMR on Outposts, see EMR clusters on AWS Outposts in the *Amazon EMR Management Guide*.

8. In the **EC2 instance profile for Amazon EMR** section, choose the IAM role that has the permissions policy that you created earlier attached.
9. Configure your remaining cluster settings, and then choose **Create cluster**.

### Configurations overview

The following tables describe the S3A and Spark configurations and the values to specify for their parameters when you set up a cluster that uses S3 on Outposts with Amazon EMR.

### S3A configurations

| Parameter | Default value | Required value for S3 on Outposts | Explanation |
|---|---|---|---|
| `fs.s3a.aws.credentials.provider` | If not specified, S3A will look for S3 in Region bucket with the Outposts bucket name. | The access point ARN of the S3 on Outposts bucket | Amazon S3 on Outposts supports virtual private cloud (VPC)-only access points as the only means to access your Outposts buckets. |
| `fs.s3a.committer.name` | `file` | `magic` | Magic committer is the only supported committer for S3 on Outposts. |
| `fs.s3a.select.enabled` | `TRUE` | `FALSE` | S3 Select is not supported on Outposts. |
| `JAVA_HOME` | `/usr/lib/jvm/java-8` | `/usr/lib/jvm/java-11-amazon-corretto.x86_64` | S3 on Outposts on S3A requires Java version 11. |

**Spark configurations**

| Parameter | Default value | Required value for S3 on Outposts | Explanation |
|---|---|---|---|
| `spark.sql.sources.fastS3PartitionDiscovery.enabled` | `TRUE` | `FALSE` | S3 on Outposts doesn't support fast partition. |
| `spark.executorEnv.JAVA_HOME` | `/usr/lib/jvm/java-8` | `/usr/lib/jvm/java-11-amazon-corretto.x86_64` | S3 on Outposts on S3A requires Java version 11. |

**Considerations**

Consider the following when you integrate Amazon EMR with S3 on Outposts buckets:

- Amazon S3 on Outposts is supported with Amazon EMR version 7.0.0 and later.
- The S3A connector is required to use S3 on Outposts with Amazon EMR. Only S3A has the features required to interact with S3 on Outposts buckets. For S3A connector setup information, see Prerequisites.
- Amazon S3 on Outposts supports only server-side encryption with Amazon S3 managed keys (SSE-S3) with Amazon EMR. For more information, see the section called “Data encryption”.
- Amazon S3 on Outposts doesn't support writes with the S3A FileOutputCommitter. Writes with the S3A FileOutputCommitter on S3 on Outposts buckets result in the following error: InvalidStorageClass: The storage class you specified is not valid.
- Amazon S3 on Outposts isn't supported with Amazon EMR Serverless or Amazon EMR on EKS.
- Amazon EMR logs are stored in a Regional Amazon S3 location that you select, and are not stored locally in the S3 on Outposts bucket.

# Authorization and authentication caching

S3 on Outposts securely caches authentication and authorization data locally on Outposts racks. The cache removes round trips to the parent AWS Region for every request. This eliminates the variability that is introduced by network round trips. With the authentication and authorization cache in S3 on Outposts, you get consistent latencies that are independent from the latency of the connection between the Outposts and the AWS Region.

When you make an S3 on Outposts API request, the authentication and authorization data is securely cached. The cached data is then used to authenticate subsequent S3 object API requests. S3 on Outposts only caches authentication and authorization data when the request is signed using Signature Version 4A (SigV4A). The cache is stored locally on the Outposts within the S3 on Outposts service. It asynchronously refreshes when you make an S3 API request. The cache is encrypted, and no plaintext cryptographic keys are stored on Outposts.

The cache is valid for up to 10 minutes when the Outpost is connected to the AWS Region. It is refreshed asynchronously when you make an S3 on Outposts API request, to ensure that the latest policies are used. If the Outpost is disconnected from the AWS Region, the cache will be valid for up to 12 hours.

## Configuring the authorization and authentication cache

S3 on Outposts automatically caches authentication and authorization data for requests signed with the SigV4A algorithm. For more information, see Signing AWS API requests in the *AWS Identity and Access Management User Guide*. The SigV4A algorithm is available in the latest versions of the AWS SDKs. You can obtain it through a dependency on the AWS Common Runtime (CRT) libraries.

You need to use the latest version of the AWS SDK and install the latest version of the CRT. For example, you can run `pip install awscrt` to obtain the latest version of the CRT with Boto3.

S3 on Outposts does not cache authentication and authorization data for requests signed with the SigV4 algorithm.

## Validating SigV4A signing

You can use AWS CloudTrail to validate that requests were signed with SigV4A. For more information on setting up CloudTrail for S3 on Outposts, see Monitoring S3 on Outposts with AWS CloudTrail logs.

After you have configured CloudTrail, you can verify how a request was signed in the `SignatureVersion` field of the CloudTrail logs. Requests that were signed with SigV4A will have a `SignatureVersion` set to `AWS4-ECDSA-P256-SHA256`. Requests that were signed with SigV4 will have `SignatureVersion` set to `AWS4-HMAC-SHA256`.

# Security in S3 on Outposts

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from data centers and network architectures that are built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS Compliance Programs. To learn about the compliance programs that apply to Amazon S3 on Outposts, see AWS Services in Scope by Compliance Program.
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using S3 on Outposts. The following topics show you how to configure S3 on Outposts to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your S3 on Outposts resources.

**Topics**

## Data encryption in S3 on Outposts

By default, all data stored in Amazon S3 on Outposts is encrypted by using server-side encryption with Amazon S3 managed encryption keys (SSE-S3). For more information, see Using server-side encryption with Amazon S3 managed keys (SSE-S3).

You can optionally use server-side encryption with customer-provided encryption keys (SSE-C). To use SSE-C, specify an encryption key as part of your object API requests. Server-side encryption encrypts only the object data, not the object metadata. For more information, see Using server-side encryption with customer-provided keys (SSE-C).

> **Note**
>
> S3 on Outposts doesn't support server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS).

## AWS PrivateLink for S3 on Outposts

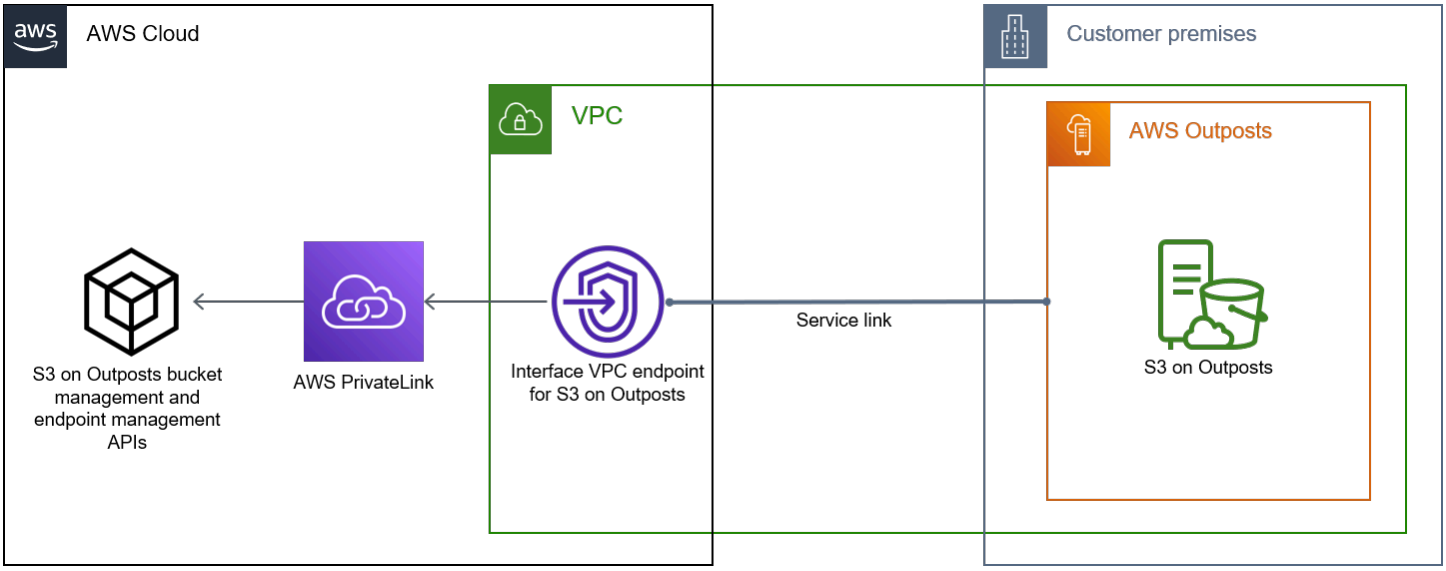
S3 on Outposts supports AWS PrivateLink, which provides direct management access to your S3 on Outposts storage through a private endpoint within your virtual private network. This allows you to simplify your internal network architecture and perform management operations on your Outposts object storage by using private IP addresses in your Virtual Private Cloud (VPC). Using AWS PrivateLink eliminates the need to use public IP addresses or proxy servers.

With AWS PrivateLink for Amazon S3 on Outposts, you can provision *interface VPC endpoints* in your virtual private cloud (VPC) to access your S3 on Outposts bucket management and endpoint management APIs. Interface VPC endpoints are directly accessible from applications deployed in your VPC or on premises over your virtual private network (VPN) or AWS Direct Connect. You can access the bucket and endpoint management APIs through AWS PrivateLink. AWS PrivateLink doesn't support data transfer API operations, such as GET, PUT, and similar APIs. These operations are already transferred privately through the S3 on Outposts endpoint and access point configuration. For more information, see Networking for S3 on Outposts.

Interface endpoints are represented by one or more elastic network interfaces (ENIs) that are assigned private IP addresses from subnets in your VPC. Requests made to interface endpoints for S3 on Outposts are automatically routed to S3 on Outposts bucket and endpoint management APIs on the AWS network. You can also access interface endpoints in your VPC from on-premises

applications through AWS Direct Connect or AWS Virtual Private Network (AWS VPN). For more information about how to connect your VPC with your on-premises network, see the *AWS Direct Connect User Guide* and the *AWS Site-to-Site VPN User Guide*.

Interface endpoints route requests for S3 on Outposts bucket and endpoint management APIs over the AWS network and through AWS PrivateLink, as illustrated in the following diagram.



For general information about interface endpoints, see Interface VPC endpoints (AWS PrivateLink) in the *AWS PrivateLink Guide*.

**Topics**

- Restrictions and limitations
- Accessing S3 on Outposts interface endpoints
- Updating an on-premises DNS configuration
- Creating a VPC endpoint for S3 on Outposts
- Creating bucket policies and VPC endpoint policies for S3 on Outposts

## Restrictions and limitations

When you access S3 on Outposts bucket and endpoint management APIs through AWS PrivateLink, VPC limitations apply. For more information, see Interface endpoint properties and limitations and AWS PrivateLink quotas in the *AWS PrivateLink Guide*.

In addition, AWS PrivateLink doesn't support the following:

- Federal Information Processing Standard (FIPS) endpoints
- S3 on Outposts data transfer APIs, for example, GET, PUT, and similar object API operations.
- Private DNS

## Accessing S3 on Outposts interface endpoints

To access S3 on Outposts bucket and endpoint management APIs using AWS PrivateLink, you *must* update your applications to use endpoint-specific DNS names. When you create an interface endpoint, AWS PrivateLink generates two types of endpoint-specific S3 on Outposts names: *Regional* and *zonal*.

- **Regional DNS names** – include a unique VPC endpoint ID, a service identifier, the AWS Region, and `vpce.amazonaws.com`, for example, *`vpce-1a2b3c4d-5e6f`*`.s3-outposts.us-east-1.vpce.amazonaws.com`.
- **Zonal DNS names** – include a unique VPC endpoint ID, the Availability Zone, a service identifier, the AWS Region, and `vpce.amazonaws.com`, for example, *`vpce-1a2b3c4d-5e6f`***`-us-east-1a.`**`s3-outposts.us-east-1.vpce.amazonaws.com`. You might use this option if your architecture isolates Availability Zones. For example, you could use zonal DNS names for fault containment or to reduce Regional data transfer costs.

> **Important**
>
> S3 on Outposts interface endpoints are resolved from the public DNS domain. S3 on Outposts does not support private DNS. Use the `--endpoint-url` parameter for all bucket and endpoint management APIs.

### AWS CLI examples

Use the `--region` and `--endpoint-url` parameters to access bucket management and endpoint management APIs through S3 on Outposts interface endpoints.

**Example : Use the endpoint URL to list buckets with the S3 control API**

In the following example, replace the Region *`us-east-1`*, VPC endpoint URL *`vpce-1a2b3c4d-5e6f.s3.us-east-1.vpce.amazonaws.com`*, and account ID *`111122223333`* with appropriate information.

```
aws s3control list-regional-buckets --region us-east-1 --endpoint-url
 https://vpce-1a2b3c4d-5e6f.s3-outposts.us-east-1.vpce.amazonaws.com --account-
id 111122223333
```

### AWS SDK examples

Update your SDKs to the latest version, and configure your clients to use an endpoint URL for accessing the S3 control API for S3 on Outposts interface endpoints. For more information, see AWS SDK examples for AWS PrivateLink.

SDK for Python (Boto3)

**Example : Use an endpoint URL to access the S3 control API**

In the following example, replace the Region *us-east-1* and VPC endpoint URL *vpce-1a2b3c4d-5e6f.s3-outposts.us-east-1.vpce.amazonaws.com* with appropriate information.

```
control_client = session.client(
service_name='s3control',
region_name='us-east-1',
endpoint_url='https://vpce-1a2b3c4d-5e6f.s3-outposts.us-east-1.vpce.amazonaws.com'
)
```

For more information, see AWS PrivateLink for Amazon S3 in the *Boto3 developer guide*.

SDK for Java 2.x

**Example : Use an endpoint URL to access the S3 control API**

In the following example, replace the VPC endpoint URL *vpce-1a2b3c4d-5e6f.s3-outposts.us-east-1.vpce.amazonaws.com* and the Region *Region.US_EAST_1* with appropriate information.

```
// control client
Region region = Region.US_EAST_1;
s3ControlClient = S3ControlClient.builder().region(region)

 .endpointOverride(URI.create("https://vpce-1a2b3c4d-5e6f.s3-outposts.us-
east-1.vpce.amazonaws.com"))
                                  .build()
```

For more information, see `S3ControlClient` in the *AWS SDK for Java API Reference*.

## Updating an on-premises DNS configuration

When using endpoint-specific DNS names to access the interface endpoints for S3 on Outposts bucket management and endpoint management APIs, you don't have to update your on-premises DNS resolver. You can resolve the endpoint-specific DNS name with the private IP address of the interface endpoint from the public S3 on Outposts DNS domain.

## Creating a VPC endpoint for S3 on Outposts

To create a VPC interface endpoint for S3 on Outposts, see Create a VPC endpoint in the *AWS PrivateLink Guide*.

## Creating bucket policies and VPC endpoint policies for S3 on Outposts

You can attach an endpoint policy to your VPC endpoint that controls access to S3 on Outposts. You can also use the `aws:sourceVpce` condition in S3 on Outposts bucket policies to restrict access to specific buckets from a specific VPC endpoint. With VPC endpoint policies, you can control access to S3 on Outposts bucket management APIs and endpoint management APIs. With bucket policies, you can control access to the S3 on Outposts bucket management APIs. However, you can't manage access to object actions for S3 on Outposts using `aws:sourceVpce`.

Access policies for S3 on Outposts specify the following information:

- The AWS Identity and Access Management (IAM) principal for which actions are allowed or denied.
- The S3 control actions that are allowed or denied.
- The S3 on Outposts resources on which actions are allowed or denied.

The following examples show policies that restrict access to a bucket or to an endpoint. For more information about VPC connectivity, see Network-to-VPC connectivity options in the AWS whitepaper Amazon Virtual Private Cloud Connectivity Options.

**Important**

- When you apply the example policies for VPC endpoints described in this section, you might block your access to the bucket without intending to do so. Bucket permissions

that limit bucket access to connections originating from your VPC endpoint can block all connections to the bucket. For information about how to fix this issue, see My bucket policy has the wrong VPC or VPC endpoint ID. How can I fix the policy so that I can access the bucket? in the *AWS Support Knowledge Center*.

- Before using the following example bucket policies, replace the VPC endpoint ID with an appropriate value for your use case. Otherwise, you won't be able to access your bucket.
- If your policy only allows access to an S3 on Outposts bucket from a specific VPC endpoint, it disables console access for that bucket because console requests don't originate from the specified VPC endpoint.

**Topics**

- Example: Restricting access to a specific bucket from a VPC endpoint
- Example: Denying access from a specific VPC endpoint in an S3 on Outposts bucket policy

### Example: Restricting access to a specific bucket from a VPC endpoint

You can create an endpoint policy that restricts access to specific S3 on Outposts buckets only. The following policy restricts access for the GetBucketPolicy action only to the *example-outpost-bucket*. To use this policy, replace the example values with your own.

```
{
  "Version": "2012-10-17",
  "Id": "Policy1415115909151",
  "Statement": [
    { "Sid": "Access-to-specific-bucket-only",
      "Principal": {"AWS":"111122223333"},
      "Action": "s3-outposts:GetBucketPolicy",
      "Effect": "Allow",
      "Resource": "arn:aws:s3-
outposts:region:123456789012:outpost/op-01ac5d28a6a232904/bucket/example-outpost-
bucket"
    }
  ]
}
```

**Example: Denying access from a specific VPC endpoint in an S3 on Outposts bucket policy**

The following S3 on Outposts bucket policy denies access to GetBucketPolicy on the *example-outpost-bucket* bucket through the *vpce-1a2b3c4d* VPC endpoint.

The `aws:sourceVpce` condition specifies the endpoint and does not require an Amazon Resource Name (ARN) for the VPC endpoint resource, only the endpoint ID. To use this policy, replace the example values with your own.

```
{
    "Version": "2012-10-17",
    "Id": "Policy1415115909152",
    "Statement": [
        {
            "Sid": "Deny-access-to-specific-VPCE",
            "Principal": {"AWS":"111122223333"},
            "Action": "s3-outposts:GetBucketPolicy",
            "Effect": "Deny",
            "Resource": "arn:aws:s3-
outposts:region:123456789012:outpost/op-01ac5d28a6a232904/bucket/example-outpost-
bucket",
            "Condition": {
                "StringEquals": {"aws:sourceVpce": "vpce-1a2b3c4d"}
            }
        }
    ]
}
```

## AWS Signature Version 4 (SigV4) authentication-specific policy keys

The following table shows the condition keys related to AWS Signature Version 4 (SigV4) authentication that you can use with Amazon S3 on Outposts. In a bucket policy, you can add these conditions to enforce specific behavior when requests are authenticated by using Signature Version 4. For example policies, see Bucket policy examples that use Signature Version 4-related condition keys. For more information about authenticating requests using Signature Version 4, see Authenticating requests (AWS Signature Version 4) in the *Amazon Simple Storage Service API Reference*

**Applicable keys for `s3-outposts:*` actions or any of the S3 on Outposts actions**

| Applicable keys | Description |
| --- | --- |
| `s3-outposts:authType` | S3 on Outposts supports various methods of authentication. To restrict incoming requests to use a specific authentication method, you can use this optional condition key. For example, you can use this condition key to allow only the HTTP `Authorization` header to be used in request authentication.<br><br>Valid values:<br><br>`REST-HEADER`<br><br>`REST-QUERY-STRING` |
| `s3-outposts:signatureAge` | The length of time, in milliseconds, that a signature is valid in an authenticated request.<br><br>This condition works only for presigned URLs.<br><br>In Signature Version 4, the signing key is valid for up to seven days. Therefore, the signatures are also valid for up to seven days. For more information, see Introduction to signing requests in the *Amazon Simple Storage Service API Reference*. You can use this condition to further limit the signature age.<br><br>Example value: `600000` |
| `s3-outposts:x-amz-content-sha256` | You can use this condition key to disallow unsigned content in your bucket.<br><br>When you use Signature Version 4, for requests that use the `Authorization` header, you add the `x-amz-content-sha256` header in the signature calculation and then set its value to the hash payload.<br><br>You can use this condition key in your bucket policy to deny any uploads where the payloads are not signed. For example: |

| Applicable keys | Description |
| --- | --- |
| | • Deny uploads that use the `Authorization` header to authenticate requests but don't sign the payload. For more information, see Transferring payload in a single chunk in the *Amazon Simple Storage Service API Reference*.<br>• Deny uploads that use presigned URLs. Presigned URLs always have an `UNSIGNED_PAYLOAD`. For more information, see Authenticating requests and Authentication methods in the *Amazon Simple Storage Service API Reference*.<br><br>Valid value: `UNSIGNED-PAYLOAD` |

## Bucket policy examples that use Signature Version 4-related condition keys

To use the following examples, replace the *`user input placeholders`* with your own information.

### Example : `s3-outposts:signatureAge`

The following bucket policy denies any S3 on Outposts presigned URL request on objects in `example-outpost-bucket` if the signature is more than 10 minutes old.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Deny a presigned URL request if the signature is more than 10
 minutes old",
            "Effect": "Deny",
            "Principal": {"AWS":"444455556666"},
            "Action": "s3-outposts:*",
            "Resource": "arn:aws:s3-outposts:us-
east-1:111122223333:outpost/op-01ac5d28a6a232904/bucket/example-outpost-bucket/object/
*",
            "Condition": {
                "NumericGreaterThan": {"s3-outposts:signatureAge": 600000},
                "StringEquals": {"s3-outposts:authType": "REST-QUERY-STRING"}
            }
```

```
        }
    ]
}
```

### Example : `s3-outposts:authType`

The following bucket policy allows only requests that use the `Authorization` header for request authentication. Any presigned URL requests will be denied since presigned URLs use query parameters to provide request and authentication information. For more information, see Authentication methods in the *Amazon Simple Storage Service API Reference*.

```
{
   "Version": "2012-10-17",
   "Statement": [
         {
               "Sid": "Allow only requests that use the Authorization header for
 request authentication. Deny presigned URL requests.",
               "Effect": "Deny",
               "Principal": {"AWS":"111122223333"},
               "Action": "s3-outposts:*",
               "Resource": "arn:aws:s3-outposts:us-
east-1:111122223333:outpost/op-01ac5d28a6a232904/bucket/example-outpost-bucket/object/
*",
               "Condition": {
                     "StringNotEquals": {
                           "s3-outposts:authType": "REST-HEADER"
                     }
               }
         }
   ]
}
```

### Example : `s3-outposts:x-amz-content-sha256`

The following bucket policy denies any uploads with unsigned payloads, such as uploads that are using presigned URLs. For more information, see Authenticating requests and Authentication methods in the *Amazon Simple Storage Service API Reference*.

```
{
   "Version": "2012-10-17",
   "Statement": [
         {
```

```
                "Sid": "Deny uploads with unsigned payloads.",
                "Effect": "Deny",
                "Principal": {"AWS":"111122223333"},
                "Action": "s3-outposts:*",
                "Resource": "arn:aws:s3-outposts:us-
east-1:111122223333:outpost/op-01ac5d28a6a232904/bucket/example-outpost-bucket/object/
*",
                "Condition": {
                      "StringEquals": {
                            "s3-outposts:x-amz-content-sha256": "UNSIGNED-PAYLOAD"
                      }
                }
          }
   ]
}
```

## AWS managed policies for Amazon S3 on Outposts

An AWS managed policy is a standalone policy that is created and administered by AWS. AWS managed policies are designed to provide permissions for many common use cases so that you can start assigning permissions to users, groups, and roles.

Keep in mind that AWS managed policies might not grant least-privilege permissions for your specific use cases because they're available for all AWS customers to use. We recommend that you reduce permissions further by defining customer managed policies that are specific to your use cases.

You cannot change the permissions defined in AWS managed policies. If AWS updates the permissions defined in an AWS managed policy, the update affects all principal identities (users, groups, and roles) that the policy is attached to. AWS is most likely to update an AWS managed policy when a new AWS service is launched or new API operations become available for existing services.

For more information, see AWS managed policies in the *IAM User Guide*.

### AWS managed policy: AWSS3OnOutpostsServiceRolePolicy

Helps manage network resources for you as part of the service-linked role `AWSServiceRoleForS3OnOutposts`.

To view the permissions for this policy, see AWSS3OnOutpostsServiceRolePolicy.

### S3 on Outposts updates to AWS managed policies

View details about updates to AWS managed policies for S3 on Outposts since this service began tracking these changes.

| Change | Description | Date |
| --- | --- | --- |
| S3 on Outposts added `AWSS3OnOutpostsServiceRolePolicy` | S3 on Outposts added `AWSS3OnOutpostsServiceRolePolicy` as part of the service-linked role `AWSServiceRoleForS3OnOutposts`, which helps manage network resources for you. | October 3, 2023 |
| S3 on Outposts started tracking changes | S3 on Outposts started tracking changes for its AWS managed policies. | October 3, 2023 |

## Using service-linked roles for Amazon S3 on Outposts

Amazon S3 on Outposts uses AWS Identity and Access Management (IAM) service-linked roles. A service-linked role is a unique type of IAM role that is linked directly to S3 on Outposts. Service-linked roles are predefined by S3 on Outposts and include all the permissions that the service requires to call other AWS services on your behalf.

A service-linked role makes setting up S3 on Outposts easier because you don’t have to manually add the necessary permissions. S3 on Outposts defines the permissions of its service-linked roles, and unless defined otherwise, only S3 on Outposts can assume its roles. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

You can delete a service-linked role only after first deleting their related resources. This protects your S3 on Outposts resources because you can't inadvertently remove permission to access the resources.

For information about other services that support service-linked roles, see AWS Services That Work with IAM and look for the services that have **Yes** in the **Service-linked roles** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

## Service-linked role permissions for S3 on Outposts

S3 on Outposts uses the service-linked role named **AWSServiceRoleForS3OnOutposts** to help manage network resources for you.

The `AWSServiceRoleForS3OnOutposts` service-linked role trusts the following services to assume the role:

- `s3-outposts.amazonaws.com`

The role permissions policy named `AWSS3OnOutpostsServiceRolePolicy` allows S3 on Outposts to complete the following actions on the specified resources:

```
{
    "Version": "2012-10-17",
    "Statement": [{
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeSubnets",
                "ec2:DescribeSecurityGroups",
                "ec2:DescribeNetworkInterfaces",
                "ec2:DescribeVpcs",
                "ec2:DescribeCoipPools",
                "ec2:GetCoipPoolUsage",
                "ec2:DescribeAddresses",
                "ec2:DescribeLocalGatewayRouteTableVpcAssociations"
            ],
            "Resource": "*",
            "Sid": "DescribeVpcResources"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:CreateNetworkInterface"
            ],
            "Resource": [
                "arn:aws:ec2:*:*:subnet/*",
                "arn:aws:ec2:*:*:security-group/*"
```

```
            ],
            "Sid": "CreateNetworkInterface"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:CreateNetworkInterface"
            ],
            "Resource": [
                "arn:aws:ec2:*:*:network-interface/*"
            ],
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/CreatedBy": "S3 On Outposts"
                }
            },
            "Sid": "CreateTagsForCreateNetworkInterface"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:AllocateAddress"
            ],
            "Resource": [
                "arn:aws:ec2:*:*:ipv4pool-ec2/*"
            ],
            "Sid": "AllocateIpAddress"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:AllocateAddress"
            ],
            "Resource": [
                "arn:aws:ec2:*:*:elastic-ip/*"
            ],
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/CreatedBy": "S3 On Outposts"
                }
            },
            "Sid": "CreateTagsForAllocateIpAddress"
        },
        {
```

```
            "Effect": "Allow",
            "Action": [
                "ec2:ModifyNetworkInterfaceAttribute",
                "ec2:CreateNetworkInterfacePermission",
                "ec2:DeleteNetworkInterface",
                "ec2:DeleteNetworkInterfacePermission",
                "ec2:DisassociateAddress",
                "ec2:ReleaseAddress",
                "ec2:AssociateAddress"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/CreatedBy": "S3 On Outposts"
                }
            },
            "Sid": "ReleaseVpcResources"
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:CreateTags"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "ec2:CreateAction": [
                        "CreateNetworkInterface",
                        "AllocateAddress"
                    ],
                    "aws:RequestTag/CreatedBy": [
                        "S3 On Outposts"
                    ]
                }
            },
            "Sid": "CreateTags"
        }
    ]
}
```

You must configure permissions to allow an IAM entity (such as a role) to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

## Creating a service-linked role for S3 on Outposts

You don't need to manually create a service-linked role. When you create an S3 on Outposts endpoint in the AWS Management Console, the AWS CLI, or the AWS API, S3 on Outposts creates the service-linked role for you.

If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account. When you create an S3 on Outposts endpoint, S3 on Outposts creates the service-linked role for you again.

You can also use the IAM console to create a service-linked role with the **S3 on Outposts** use case. In the AWS CLI or the AWS API, create a service-linked role with the `s3-outposts.amazonaws.com` service name. For more information, see Creating a service-linked role in the *IAM User Guide*. If you delete this service-linked role, you can use this same process to create the role again.

## Editing a service-linked role for S3 on Outposts

S3 on Outposts does not allow you to edit the `AWSServiceRoleForS3OnOutposts` service-linked role. This includes the name of the role because various entities might reference it. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

## Deleting a service-linked role for S3 on Outposts

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don't have an unused entity that is not actively monitored or maintained. However, you must clean up the resources for your service-linked role before you can manually delete it.

> **Note**
>
> If the S3 on Outposts service is using the role when you try to delete the resources, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

**To delete S3 on Outposts resources used by the AWSServiceRoleForS3OnOutposts role**

1. Delete the S3 on Outposts endpoints in your AWS account across all AWS Regions.
2. Delete the service-linked role using IAM.

Use the IAM console, the AWS CLI, or the AWS API to delete the `AWSServiceRoleForS3OnOutposts` service-linked role. For more information, see Deleting a service-linked role in the *IAM User Guide*.

### Supported Regions for S3 on Outposts service-linked roles

S3 on Outposts supports using service-linked roles in all of the AWS Regions where the service is available. For more information, see S3 on Outposts Regions and endpoints.

## Managing S3 on Outposts storage

With Amazon S3 on Outposts, you can create S3 buckets on your AWS Outposts and easily store and retrieve objects on premises for applications that require local data access, local data processing, and data residency. S3 on Outposts provides a new storage class, S3 Outposts (OUTPOSTS), which uses the Amazon S3 APIs, and is designed to store data durably and redundantly across multiple devices and servers on your AWS Outposts. You communicate with your Outpost bucket by using an access point and endpoint connection over a virtual private cloud (VPC). You can use the same APIs and features on Outpost buckets as you do on Amazon S3 buckets, including access policies, encryption, and tagging. You can use S3 on Outposts through the AWS Management Console, AWS Command Line Interface (AWS CLI), AWS SDKs, or REST API. For more information, see What is Amazon S3 on Outposts?

For more information about managing and sharing your Amazon S3 on Outposts storage capacity, see the following topics.

**Topics**

- Managing S3 Versioning for your S3 on Outposts bucket
- Creating and managing a lifecycle configuration for your Amazon S3 on Outposts bucket
- Replicating objects for S3 on Outposts
- Sharing S3 on Outposts by using AWS RAM
- Other AWS services that use S3 on Outposts

## Managing S3 Versioning for your S3 on Outposts bucket

When enabled, S3 Versioning saves multiple distinct copies of an object in the same bucket. You can use S3 Versioning to preserve, retrieve, and restore every version of every object stored in your

Outposts buckets. S3 Versioning helps you recover from unintended user actions and application failures.

Amazon S3 on Outposts buckets have three versioning states:

- **Unversioned** – If you've never enabled or suspended S3 Versioning on your bucket, it is unversioned and returns no S3 Versioning status. For more information about S3 Versioning, see Using versioning in S3 buckets.
- **Enabled** – Enables S3 Versioning for the objects in the bucket. All objects added to the bucket receive a unique version ID. Objects that already existed in the bucket at the time that you enable versioning have a version ID of `null`. If you modify these (or any other) objects with other operations, such as PutObject, the new objects get a unique version ID.
- **Suspended** – Suspends S3 Versioning for the objects in the bucket. All objects added to the bucket after versioning is suspended receive the version ID `null`. For more information, see Adding objects to versioning-suspended buckets.

After you enable S3 Versioning for an S3 on Outposts bucket, it can never return to an unversioned state. However, you can suspend versioning. For more information about S3 Versioning, see Using versioning in S3 buckets.

For each object in your bucket, you have a current version and zero or more noncurrent versions. To reduce storage costs, you can configure your bucket S3 Lifecycle rules to expire noncurrent versions after a specified time period. For more information, see Creating and managing a lifecycle configuration for your Amazon S3 on Outposts bucket.

The following examples show you how to enable or suspend versioning for an existing S3 on Outposts bucket by using the AWS Management Console and the AWS Command Line Interface (AWS CLI). To create a bucket with S3 Versioning enabled, see Creating an S3 on Outposts bucket.

> **Note**
>
> The AWS account that creates the bucket owns it and is the only one that can commit actions to it. Buckets have configuration properties, such as Outpost, tag, default encryption, and access point settings. The access point settings include the virtual private cloud (VPC), the access point policy for accessing the objects in the bucket, and other metadata. For more information, see S3 on Outposts specifications.

### Using the S3 console

#### To edit the S3 Versioning settings for your bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Outposts buckets**.
3. Choose the Outposts bucket that you want to enable S3 Versioning for.
4. Choose the **Properties** tab.
5. Under **Bucket Versioning**, choose **Edit**.
6. Edit the S3 Versioning settings for the bucket by choosing one of the following options:
   - To suspend S3 Versioning and stop the creation of new object versions, choose **Suspend**.
   - To enable S3 Versioning and save multiple distinct copies of each object, choose **Enable**.
7. Choose **Save changes**.

### Using the AWS CLI

To enable or suspend S3 Versioning for your bucket by using the AWS CLI, use the `put-bucket-versioning` command, as shown in the following examples. To use these examples, replace each *`user input placeholder`* with your own information.

For more information, see put-bucket-versioning in the *AWS CLI Reference*.

#### Example : To enable S3 Versioning

```
aws s3control put-bucket-versioning --account-id 123456789012 --bucket arn:aws:s3-outposts:region:123456789012:outpost/op-01ac5d28a6a232904/bucket/example-outposts-bucket --versioning-configuration Status=Enabled
```

#### Example : To suspend S3 Versioning

```
aws s3control put-bucket-versioning --account-id 123456789012 --bucket arn:aws:s3-outposts:region:123456789012:outpost/op-01ac5d28a6a232904/bucket/example-outposts-bucket --versioning-configuration Status=Suspended
```

# Creating and managing a lifecycle configuration for your Amazon S3 on Outposts bucket

You can use S3 Lifecycle to optimize storage capacity for Amazon S3 on Outposts. You can create lifecycle rules to expire objects as they age or are replaced by newer versions. You can create, enable, disable, or delete a lifecycle rule.

For more information about S3 Lifecycle, see Managing your storage lifecycle.

> **Note**
>
> The AWS account that creates the bucket owns it and is the only one that can create, enable, disable, or delete a lifecycle rule.

To create and manage the lifecycle configuration for your S3 on Outposts bucket, see the following topics.

**Topics**

- Creating and managing a lifecycle rule by using the AWS Management Console
- Creating and managing a lifecycle configuration by using the AWS CLI and SDK for Java

## Creating and managing a lifecycle rule by using the AWS Management Console

You can use S3 Lifecycle to optimize storage capacity for Amazon S3 on Outposts. You can create lifecycle rules to expire objects as they age or are replaced by newer versions. You can create, enable, disable, or delete a lifecycle rule.

For more information about S3 Lifecycle, see Managing your storage lifecycle.

> **Note**
>
> The AWS account that creates the bucket owns it and is the only one that can create, enable, disable, or delete a lifecycle rule.

To create and manage a lifecycle rule for an S3 on Outposts by using the AWS Management Console, see the following topics.

**Topics**

### Creating a lifecycle rule

1. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Outposts buckets**.
3. Choose the Outposts bucket that you want to create a lifecycle rule for.
4. Choose the **Management** tab, and then choose **Create Lifecycle rule**.
5. Enter a value for **Lifecycle rule name**.
6. Under **Rule scope**, choose one of the following options:
   - To limit the scope to specific filters, choose **Limit the scope of this rule using one or more filters**. Then, add a prefix filter, tags, or object size.
   - To apply the rule to all objects in the bucket, choose **Apply to all objects in the bucket**.
7. Under **Lifecycle rule actions**, choose one of the following options:
   - **Expire current versions of objects** – For versioning-enabled buckets, S3 on Outposts adds a delete marker and retains the objects as noncurrent versions. For buckets that don't use S3 Versioning, S3 on Outposts permanently deletes the objects.
   - **Permanently delete noncurrent versions of objects** – S3 on Outposts permanently deletes noncurrent versions of objects.
   - **Delete expired object delete markers or incomplete multipart uploads** – S3 on Outposts permanently deletes expired object delete markers or incomplete multipart uploads.

     If you limit the scope of your Lifecycle rule by using object tags, you can't choose **Delete expired object delete markers**. You also can't choose **Delete expired object delete markers** if you choose **Expire current object versions**.

> **Note**
>
> Size-based filters can't be used with delete markers and incomplete multipart uploads.

8. If you chose **Expire current versions of objects** or **Permanently delete noncurrent versions of objects**, configure the rule trigger based on a specific date or the object's age.
9. If you chose **Delete expired object delete markers**, to confirm that you want to delete expired object delete markers, select **Delete expired object delete markers**.
10. Under **Timeline Summary**, review your Lifecycle rule, and choose **Create rule**.

### Enabling a lifecycle rule

#### To enable or disable a bucket lifecycle rule

1. Open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Outposts buckets**.
3. Choose the Outposts bucket that you want to enable or disable a lifecycle rule for.
4. Choose the **Management** tab, and then under **Lifecycle rule**, choose the rule that you want to enable or disable.
5. For **Action**, choose **Enable or disable rule**.

### Editing a lifecycle rule

1. Open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Outposts buckets**.
3. Choose the Outposts bucket that you want to edit a lifecycle rule for.
4. Choose the **Management** tab, and then choose the **Lifecycle rule** that you want to edit.
5. (Optional) Update the value for **Lifecycle rule name**.
6. Under **Rule scope**, edit the scope as needed:

   - To limit the scope to specific filters, choose **Limit the scope of this rule using one or more filters**. Then, add a prefix filter, tags, or object size.
   - To apply the rule to all objects in the bucket, choose **Apply to all objects in the bucket**.

7. Under **Lifecycle rule actions**, choose one of the following options:

   - **Expire current versions of objects** – For versioning-enabled buckets, S3 on Outposts adds a delete marker and retains the objects as noncurrent versions. For buckets that don't use S3 Versioning, S3 on Outposts permanently deletes the objects.
   - **Permanently delete noncurrent versions of objects** – S3 on Outposts permanently deletes noncurrent versions of objects.
   - **Delete expired object delete markers or incomplete multipart uploads** – S3 on Outposts permanently deletes expired object delete markers or incomplete multipart uploads.

     If you limit the scope of your Lifecycle rule by using object tags, you can't choose **Delete expired object delete markers**. You also can't choose **Delete expired object delete markers** if you choose **Expire current object versions**.

   > **Note**
   >
   > Size-based filters can't be used with delete markers and incomplete multipart uploads.

8. If you chose **Expire current versions of objects** or **Permanently delete noncurrent versions of objects**, configure the rule trigger based on a specific date or the object age.
9. If you chose **Delete expired object delete markers**, to confirm that you want to delete expired object delete markers, select **Delete expired object delete markers**.
10. Choose **Save**.

### Deleting a lifecycle rule

1. Open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Outposts buckets**.
3. Choose the Outposts bucket that you want to delete a lifecycle rule for.
4. Choose the **Management** tab, and then under **Lifecycle rule**, choose the rule that you want to delete.
5. Choose **Delete**.

## Creating and managing a lifecycle configuration by using the AWS CLI and SDK for Java

You can use S3 Lifecycle to optimize storage capacity for Amazon S3 on Outposts. You can create lifecycle rules to expire objects as they age or are replaced by newer versions. You can create, enable, disable, or delete a lifecycle rule.

For more information about S3 Lifecycle, see Managing your storage lifecycle.

> **Note**
>
> The AWS account that creates the bucket owns it and is the only one that can create, enable, disable, or delete a lifecycle rule.

To create and manage a lifecycle configuration for an S3 on Outposts bucket by using the AWS Command Line Interface (AWS CLI) and the AWS SDK for Java, see the following examples.

**Topics**

- PUT a lifecycle configuration
- GET the lifecycle configuration on an S3 on Outposts bucket

### PUT a lifecycle configuration

AWS CLI

The following AWS CLI example puts a lifecycle configuration policy on an Outposts bucket. This policy specifies that all objects that have the flagged prefix (*myprefix*) and tags expire after 10 days. To use this example, replace each *user input placeholder* with your own information.

1. Save the lifecycle configuration policy to a JSON file. In this example, the file is named `lifecycle1.json`.

```
{
    "Rules": [
        {
            "ID": "id-1",
            "Filter": {
```

```
                "And": {
                    "Prefix": "myprefix",
                    "Tags": [
                        {
                            "Value": "mytagvalue1",
                            "Key": "mytagkey1"
                        },
                        {
                            "Value": "mytagvalue2",
                            "Key": "mytagkey2"
                        }
                    ],
                    "ObjectSizeGreaterThan": 1000,
                    "ObjectSizeLessThan": 5000
                }
            },
            "Status": "Enabled",
            "Expiration": {
                "Days": 10
            }
        }
    ]
}
```

2. Submit the JSON file as part of the `put-bucket-lifecycle-configuration` CLI command. To use this command, replace each *`user input placeholder`* with your own information. For more information about this command, see put-bucket-lifecycle-configuration in the *AWS CLI Reference*.

```
aws s3control put-bucket-lifecycle-configuration --account-id 123456789012 --
bucket arn:aws:s3-outposts:region:123456789012:outpost/op-01ac5d28a6a232904/
bucket/example-outposts-bucket --lifecycle-configuration file://lifecycle1.json
```

SDK for Java

The following SDK for Java example puts a lifecycle configuration on an Outposts bucket. This lifecycle configuration specifies that all objects that have the flagged prefix (*`myprefix`*) and tags expire after 10 days. To use this example, replace each *`user input placeholder`* with your own information. For more information, see PutBucketLifecycleConfiguration in the *Amazon Simple Storage Service API Reference*.

```
import com.amazonaws.services.s3control.model.*;

public void putBucketLifecycleConfiguration(String bucketArn) {

    S3Tag tag1 = new S3Tag().withKey("mytagkey1").withValue("mytagkey1");
    S3Tag tag2 = new S3Tag().withKey("mytagkey2").withValue("mytagkey2");

    LifecycleRuleFilter lifecycleRuleFilter = new LifecycleRuleFilter()
            .withAnd(new LifecycleRuleAndOperator()
                    .withPrefix("myprefix")
                    .withTags(tag1, tag2))
                    .withObjectSizeGreaterThan(1000)
                    .withObjectSizeLessThan(5000);

    LifecycleExpiration lifecycleExpiration = new LifecycleExpiration()
            .withExpiredObjectDeleteMarker(false)
            .withDays(10);

    LifecycleRule lifecycleRule = new LifecycleRule()
            .withStatus("Enabled")
            .withFilter(lifecycleRuleFilter)
            .withExpiration(lifecycleExpiration)
            .withID("id-1");

    LifecycleConfiguration lifecycleConfiguration = new LifecycleConfiguration()
            .withRules(lifecycleRule);

    PutBucketLifecycleConfigurationRequest reqPutBucketLifecycle = new
 PutBucketLifecycleConfigurationRequest()
            .withAccountId(AccountId)
            .withBucket(bucketArn)
            .withLifecycleConfiguration(lifecycleConfiguration);

    PutBucketLifecycleConfigurationResult respPutBucketLifecycle =
 s3ControlClient.putBucketLifecycleConfiguration(reqPutBucketLifecycle);
    System.out.printf("PutBucketLifecycleConfiguration Response: %s%n",
 respPutBucketLifecycle.toString());

}
```

**GET the lifecycle configuration on an S3 on Outposts bucket**

AWS CLI

The following AWS CLI example gets a lifecycle configuration on an Outposts bucket. To use this command, replace each *user input placeholder* with your own information. For more information about this command, see get-bucket-lifecycle-configuration in the *AWS CLI Reference*.

```
aws s3control get-bucket-lifecycle-configuration --account-id 123456789012 --bucket
 arn:aws:s3-outposts:<your-region>:123456789012:outpost/op-01ac5d28a6a232904/
bucket/example-outposts-bucket
```

SDK for Java

The following SDK for Java example gets a lifecycle configuration for an Outposts bucket. For more information, see GetBucketLifecycleConfiguration in the *Amazon Simple Storage Service API Reference*.

```
import com.amazonaws.services.s3control.model.*;

public void getBucketLifecycleConfiguration(String bucketArn) {

    GetBucketLifecycleConfigurationRequest reqGetBucketLifecycle = new
 GetBucketLifecycleConfigurationRequest()
            .withAccountId(AccountId)
            .withBucket(bucketArn);

    GetBucketLifecycleConfigurationResult respGetBucketLifecycle =
 s3ControlClient.getBucketLifecycleConfiguration(reqGetBucketLifecycle);
    System.out.printf("GetBucketLifecycleConfiguration Response: %s%n",
 respGetBucketLifecycle.toString());

}
```

## Replicating objects for S3 on Outposts

With S3 Replication on AWS Outposts, you can configure Amazon S3 on Outposts to automatically replicate S3 objects across different Outposts, or between buckets on the same Outpost. You can use S3 Replication on Outposts to maintain multiple replicas of your data in the same or

different Outposts, or across different accounts, to help meet data-residency needs. S3 Replication on Outposts helps power your compliant storage needs and data sharing across accounts. If you need to ensure that your replicas are identical to the source data, you can use S3 Replication on Outposts to make replicas of your objects that retain all metadata, such as the original object creation time, tags, and version IDs.

S3 Replication on Outposts also provides detailed metrics and notifications to monitor the status of object replication between buckets. You can use Amazon CloudWatch to monitor replication progress by tracking bytes pending replication, operations pending replication, and replication latency between your source and destination buckets. To quickly diagnose and correct configuration issues, you can also set up Amazon EventBridge to receive notifications about replication object failures. To learn more, see Managing your replication.

**Topics**

## Replication configuration

S3 on Outposts stores a replication configuration as XML. In the replication configuration XML file, you specify an AWS Identity and Access Management (IAM) role and one or more rules.

```
<ReplicationConfiguration>
    <Role>IAM-role-ARN</Role>
    <Rule>
        ...
    </Rule>
    <Rule>
         ...
    </Rule>
     ...
</ReplicationConfiguration>
```

S3 on Outposts can't replicate objects without your permission. You grant S3 on Outposts permissions with the IAM role that you specify in the replication configuration. S3 on Outposts assumes that IAM role to replicate objects on your behalf. You must grant the required permissions to the IAM role before starting replication. For more information about these permissions for S3 on Outposts, see Creating an IAM role.

You add one rule in a replication configuration in the following scenarios:

- You want to replicate all objects.
- You want to replicate one subset of objects. You identify the object subset by adding a filter in the rule. In the filter, you specify an object key prefix, tags, or a combination of both, to identify the subset of objects that the rule applies to.

You add multiple rules in a replication configuration if you want to replicate different subsets of objects. In each rule, you specify a filter that selects a different subset of objects. For example, you might choose to replicate objects that have either `tax/` or `document/` key prefixes. To do this, you add two rules, one that specifies the `tax/` key prefix filter and another that specifies the `document/` key prefix.

For more information about S3 on Outposts replication configuration and replication rules, see ReplicationConfiguration in the *Amazon Simple Storage Service API Reference*.

## Requirements for S3 Replication on Outposts

Replication requires the following:

- The destination Outpost CIDR range must be associated in your source Outpost subnet table. For more information, see Prerequisites for creating replication rules.
- Both the source and destination buckets must have S3 Versioning enabled. For more information about versioning, see Managing S3 Versioning for your S3 on Outposts bucket.
- Amazon S3 on Outposts must have permission to replicate objects from the source bucket to the destination bucket on your behalf. That means you must create a service role to delegate `GET` and `PUT` permissions to S3 on Outposts.
  1. Before creating the service role, you must have `GET` permission on the source bucket and `PUT` permission on the destination bucket.
  2. To create the service role to delegate permissions to S3 on Outposts, you must first configure permissions to allow an IAM entity (a user or role) to perform the `iam:CreateRole` and

`iam:PassRole` actions. Then, you allow the IAM entity to create a service role. To make S3 on Outposts assume the service role on your behalf and delegate GET and PUT permissions to S3 on Outposts, you must assign the necessary trust and permissions policies to the role. For more information about these permissions for S3 on Outposts, see Creating an IAM role. For more information about creating a service role, see Creating a service role.

## What is replicated?

By default, S3 on Outposts replicates the following:

- Objects created after you add a replication configuration.
- Object metadata from the source objects to the replicas. For information about how to replicate metadata from the replicas to the source objects, see Replication status if Amazon S3 replica modification sync on Outposts is enabled.
- Object tags, if there are any.

### How delete operations affect replication

If you delete an object from the source bucket, the following actions occur by default:

- If you make a `DELETE` request without specifying an object version ID, S3 on Outposts adds a delete marker. S3 on Outposts deals with the delete marker as follows:
  - S3 on Outposts does not replicate the delete marker by default.
  - However, you can add *delete marker replication* to non-tag-based rules. For more information about how to enable delete marker replication in your replication configuration, see Using the S3 console.
- If you specify an object version ID to delete in a `DELETE` request, S3 on Outposts permanently deletes that object version in the source bucket. However, it doesn't replicate the deletion in the destination buckets. In other words, it doesn't delete the same object version from the destination buckets. This behavior protects data from malicious deletions.

## What isn't replicated?

By default, S3 on Outposts doesn't replicate the following:

- Objects in the source bucket that are replicas that were created by another replication rule. For example, suppose you configure replication where bucket A is the source and bucket B is the destination. Now suppose that you add another replication configuration where bucket B is the source and bucket C is the destination. In this case, objects in bucket B that are replicas of objects in bucket A are not replicated to bucket C.
- Objects in the source bucket that have already been replicated to a different destination. For example, if you change the destination bucket in an existing replication configuration, S3 on Outposts won't replicate the objects again.
- Objects that are created with server-side encryption with customer-provided encryption keys (SSE-C).
- Updates to bucket-level subresources.

  For example, if you change the lifecycle configuration or add a notification configuration to your source bucket, these changes are not applied to the destination bucket. This feature makes it possible to have different configurations on the source and destination buckets.
- Actions performed by lifecycle configuration.

  For example, if you enable a lifecycle configuration only on your source bucket and configure expiration actions, S3 on Outposts creates delete markers for expired objects in the source bucket but doesn't replicate those markers to the destination buckets. If you want the same lifecycle configuration applied to both the source and destination buckets, enable the same lifecycle configuration on both. For more information about lifecycle configuration, see Managing your storage lifecycle.

## What isn't supported by S3 Replication on Outposts?

The following S3 Replication features are currently not supported by S3 on Outposts:

- S3 Replication Time Control (S3 RTC). S3 RTC is not supported because the object traffic in S3 Replication on Outposts travels over your on-premises network (the local gateway). For more information about local gateways, see Working with the local gateway in the *AWS Outposts User Guide*.
- S3 Replication for Batch Operations.

## Setting up replication

> **Note**
>
> Objects that existed in your bucket before you set up a replication rule aren't replicated automatically. In other words, Amazon S3 on Outposts doesn't replicate objects retroactively. To replicate objects that were created before your replication configuration, you can use the `CopyObject` API operation to copy them to the same bucket. After the objects are copied, they appear as "new" objects in the bucket and the replication configuration will apply to them. For more information about copying an object, see Copying an object in an Amazon S3 on Outposts bucket using the AWS SDK for Java and CopyObject in the *Amazon Simple Storage Service API Reference*.

To enable S3 Replication on Outposts, add a replication rule to your source Outposts bucket. The replication rule tells S3 on Outposts to replicate objects as specified. In the replication rule, you must provide the following:

- **The source Outposts bucket access point** – The access point Amazon Resource Name (ARN) or access point alias of the bucket from which you want S3 on Outposts to replicate the objects. For more information about using access point aliases, see Using a bucket-style alias for your S3 on Outposts bucket access point.
- **The objects that you want to replicate** – You can replicate all of the objects in the source Outposts bucket or a subset. You identify a subset by providing a key name prefix, one or more object tags, or both in the configuration.

  For example, if you configure a replication rule to replicate only objects with the key name prefix `Tax/`, S3 on Outposts replicates objects with keys such as `Tax/doc1` or `Tax/doc2`. But it doesn't replicate objects with the key `Legal/doc3`. If you specify both a prefix and one or more tags, S3 on Outposts replicates only objects that have the specific key prefix and tags.
- **The destination Outposts bucket** – The ARN or access point alias of the bucket to which you want S3 on Outposts to replicate the objects.

You can configure the replication rule by using the REST API, AWS SDKs, AWS Command Line Interface (AWS CLI), or Amazon S3 console.

S3 on Outposts also provides API operations to support setting up replication rules. For more information, see the following topics in the *Amazon Simple Storage Service API Reference*:

- PutBucketReplication
- GetBucketReplication
- DeleteBucketReplication

**Topics**

### Prerequisites for creating replication rules

**Topics**

#### Connecting your source and destination Outpost subnets

To have your replication traffic go from your source Outpost to your destination Outpost over your local gateway, you must add a new route to set up networking. You must connect the Classless Inter-Domain Routing (CIDR) networking ranges of your access points together. For each pair of access points, you need to set up this connection only once.

Some steps to set up the connection are different, depending on the access type of your Outposts endpoints that are associated with your access points. The access type for endpoints is either **Private** (direct virtual private cloud [VPC] routing for AWS Outposts) or **Customer owned IP** (a customer-owned IP address pool [CoIP pool] within your on-premises network).

**Step 1: Find the CIDR range of your source Outposts endpoint**

**To find the CIDR range of your source endpoint that's associated with your source access point**

1. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Outposts buckets**.

3. In the **Outposts buckets** list, choose the source bucket that you want for replication.
4. Choose the **Outposts access points** tab, and choose the Outposts access point for the source bucket for your replication rule.
5. Choose the Outposts endpoint.
6. Copy the subnet ID for use in Step 5.
7. The method that you use to find the CIDR range of the source Outposts endpoint depends on the access type of your endpoint.

   In the **Outposts endpoint overview** section, see the **Access Type**.

   - If the access type is **Private**, copy the **Classless inter-domain routing (CIDR)** value to use in Step 6.
   - If the access type is **Customer Owned IP**, do the following:
     1. Copy the **Customer owned IPv4 pool** value to use as the ID of the address pool later on.
     2. Open the AWS Outposts console at https://console.aws.amazon.com/outposts/.
     3. In the navigation pane, choose **Local gateway route tables**.
     4. Choose the **Local gateway route table ID** value of your source Outpost.
     5. In the details pane, choose the **CoIP pools** tab. Paste the value of your CoIP pool ID that you copied previously in the search box.
     6. For the matched CoIP pool, copy the corresponding **CIDRs** value of your source Outposts endpoint for use in Step 6.

### Step 2: Find the subnet ID and the CIDR range of your destination Outposts endpoint

To find the subnet ID and the CIDR range of your destination endpoint that's associated with your destination access point, follow the same substeps in Step 1 and change your source Outposts endpoint to your destination Outposts endpoint when you apply those substeps. Copy the subnet ID value of your destination Outposts endpoint for use in Step 6. Copy the CIDR value of your destination Outposts endpoint for use in Step 5.

### Step 3: Find the local gateway ID of your source Outpost

#### To find the local gateway ID of your source Outpost

1. Open the AWS Outposts console at https://console.aws.amazon.com/outposts/.
2. In the left navigation pane, choose **Local gateways**.

3. On the **Local gateways** page, find the Outpost ID of your source Outpost that you want to use for replication.
4. Copy the local gateway ID value of your source Outpost for use in Step 5.

For more information about local gateway, see Local gateway in the *AWS Outposts User Guide*.

**Step 4: Find the local gateway ID of your destination Outpost**

To find the local gateway ID of your destination Outpost, follow the same substeps in Step 3, except look for the Outpost ID for your destination Outpost. Copy the local gateway ID value of your destination Outpost for use in Step 6.

**Step 5: Set up the connection from your source Outpost subnet to your destination Outpost subnet**

**To connect from your source Outpost subnet to your destination Outpost subnet**

1. Sign in to the AWS Management Console and open the VPC console at https://console.aws.amazon.com/vpc/.
2. In the left navigation pane, choose **Subnets**.
3. In the search box, enter the subnet ID for your source Outposts endpoint that you found in Step 1. Choose the subnet with the matched subnet ID.
4. For the matched subnet item, choose the **Route table** value of this subnet.
5. On the page with a selected route table, choose **Actions**, and then choose **Edit routes**.
6. On the **Edit routes** page, choose **Add route**.
7. Under **Destination**, enter the CIDR range of your destination Outposts endpoint that you found in Step 2.
8. Under **Target**, choose **Outpost Local Gateway**, and enter the local gateway ID of your source Outpost that you found in Step 3.
9. Choose **Save changes**.
10. Make sure the **Status** for the route is **Active**.

**Step 6: Set up the connection from your destination Outpost subnet to your source Outpost subnet**

1. Sign in to the AWS Management Console and open the VPC console at https://console.aws.amazon.com/vpc/.
2. In the left navigation pane, choose **Subnets**.
3. In the search box, enter the subnet ID for your destination Outposts endpoint that you found in Step 2. Choose the subnet with the matched subnet ID.
4. For the matched subnet item, choose the **Route table** value of this subnet.
5. On the page with a selected route table, choose **Actions**, and then choose **Edit routes**.
6. On the **Edit routes** page, choose **Add route**.
7. Under **Destination**, enter the CIDR range of your source Outposts endpoint that you found in Step 1.
8. Under **Target**, choose **Outpost Local Gateway**, and enter the local gateway ID of your destination Outpost that you found in Step 4.
9. Choose **Save changes**.
10. Make sure the **Status** for the route is **Active**.

After you connect the CIDR networking ranges of your source and destination access points, you must create an AWS Identity and Access Management (IAM) role.

**Creating an IAM role**

By default, all S3 on Outposts resources—buckets, objects, and related subresources—are private, and only the resource owner can access the resource. S3 on Outposts needs permissions to read and replicate objects from the source Outposts bucket. You grant these permissions by creating an IAM *service role* and specifying that role in your replication configuration.

This section explains the trust policy and minimum required permissions policy. The example walkthroughs provide step-by-step instructions to create an IAM role. For more information, see Creating replication rules on Outposts. For more information about IAM roles, see IAM roles in the *IAM User Guide*.

- The following example shows a *trust policy*, where you identify S3 on Outposts as the service principal that can assume the role.

```
{
   "Version":"2012-10-17",
   "Statement":[
      {
         "Effect":"Allow",
         "Principal":{
            "Service":"s3-outposts.amazonaws.com"
         },
         "Action":"sts:AssumeRole"
      }
   ]
}
```

- The following example shows an *access policy*, where you grant the role permissions to perform replication tasks on your behalf. When S3 on Outposts assumes the role, it has the permissions that you specify in this policy. To use this policy, replace the *`user input placeholders`* with your own information. Make sure to replace them with the Outpost IDs of your source and destination Outposts and the bucket names and access point names of your source and destination Outposts buckets.

```
{
   "Version":"2012-10-17",
   "Statement":[
      {
         "Effect":"Allow",
         "Action":[
            "s3-outposts:GetObjectVersionForReplication",
            "s3-outposts:GetObjectVersionTagging"
         ],
         "Resource":[
            "arn:aws:s3-outposts:region:123456789012:outpost/SOURCE-OUTPOST-ID/
bucket/SOURCE-OUTPOSTS-BUCKET/object/*",
            "arn:aws:s3-outposts:region:123456789012:outpost/SOURCE-OUTPOST-ID/
accesspoint/SOURCE-OUTPOSTS-BUCKET-ACCESS-POINT/object/*"
         ]
      },
      {
         "Effect":"Allow",
         "Action":[
            "s3-outposts:ReplicateObject",
            "s3-outposts:ReplicateDelete"
```

```
         ],
         "Resource":[
            "arn:aws:s3-outposts:region:123456789012:outpost/DESTINATION-OUTPOST-ID/
bucket/DESTINATION-OUTPOSTS-BUCKET/object/*",
            "arn:aws:s3-outposts:region:123456789012:outpost/DESTINATION-OUTPOST-ID/
accesspoint/DESTINATION-OUTPOSTS-BUCKET-ACCESS-POINT/object/*"
         ]
      }
   ]
}
```

The access policy grants permissions for the following actions:

- `s3-outposts:GetObjectVersionForReplication` – Permission for this action is granted on all objects to allow S3 on Outposts to get a specific object version that's associated with each object.

- `s3-outposts:GetObjectVersionTagging` – Permission for this action on objects in the *SOURCE-OUTPOSTS-BUCKET* bucket (the source bucket) allows S3 on Outposts to read object tags for replication. For more information, see Adding tags for S3 on Outposts buckets. If S3 on Outposts doesn't have this permission, it replicates the objects, but not the object tags.
- `s3-outposts:ReplicateObject` and `s3-outposts:ReplicateDelete` – Permissions for these actions on all objects in the *DESTINATION-OUTPOSTS-BUCKET* bucket (the destination bucket) allow S3 on Outposts to replicate objects or delete markers to the destination Outposts bucket. For information about delete markers, see How delete operations affect replication.

  **Note**

  - Permission for the `s3-outposts:ReplicateObject` action on the *DESTINATION-OUTPOSTS-BUCKET* bucket (the destination bucket) also allows replication of object tags. Therefore, you don't need to explicitly grant permission for the `s3-outposts:ReplicateTags` action.
  - For cross-account replication, the owner of the destination Outposts bucket must update its bucket policy to grant permission for the `s3-outposts:ReplicateObject` action on the*DESTINATION-OUTPOSTS-BUCKET*. The `s3-outposts:ReplicateObject` action allows S3 on Outposts to replicate objects and object tags to the destination Outposts bucket.

For a list of S3 on Outposts actions, see Actions defined by S3 on Outposts.

> **Important**
>
> The AWS account that owns the IAM role must have permissions for the actions that it grants to the IAM role.
> For example, suppose that the source Outposts bucket contains objects owned by another AWS account. The owner of the objects must explicitly grant the AWS account that owns the IAM role the required permissions through the bucket policy and the access point policy. Otherwise, S3 on Outposts can't access the objects, and replication of the objects fails.
> The permissions described here are related to the minimum replication configuration. If you choose to add optional replication configurations, you must grant additional permissions to S3 on Outposts.

**Granting permissions when the source and destination Outposts buckets are owned by different AWS accounts**

When the source and destination Outposts buckets aren't owned by the same accounts, the owner of the destination Outposts bucket must update the bucket and access point policies for the destination bucket. These policies must grant the owner of the source Outposts bucket and the IAM service role permissions to perform replication actions, as shown in the following policy examples, or replication will fail. In these policy examples, *`DESTINATION-OUTPOSTS-BUCKET`* is the destination bucket. To use these policy examples, replace the *`user input placeholders`* with your own information.

If you're creating the IAM service role manually, set the role path as `role/service-role/`, as shown in the following policy examples. For more information, see IAM ARNs in the *IAM User Guide*.

```
{
   "Version":"2012-10-17",
   "Id":"PolicyForDestinationBucket",
   "Statement":[
      {
         "Sid":"Permissions on objects",
         "Effect":"Allow",
         "Principal":{
```

```
            "AWS":"arn:aws:iam::SourceBucket-account-ID:role/service-role/source-
account-IAM-role"
         },
         "Action":[
            "s3-outposts:ReplicateDelete",
            "s3-outposts:ReplicateObject"
         ],
         "Resource":[
            "arn:aws:s3-outposts:region:DestinationBucket-account-
ID:outpost/DESTINATION-OUTPOST-ID/bucket/DESTINATION-OUTPOSTS-BUCKET/object/*"
         ]
      }

   ]
}
```

```
{
"Version":"2012-10-17",
   "Id":"PolicyForDestinationAccessPoint",
   "Statement":[
      {
         "Sid":"Permissions on objects",
         "Effect":"Allow",
         "Principal":{
            "AWS":"arn:aws:iam::SourceBucket-account-ID:role/service-role/source-
account-IAM-role"
         },
         "Action":[
            "s3-outposts:ReplicateDelete",
            "s3-outposts:ReplicateObject"
         ],
         "Resource" :[
            "arn:aws:s3-outposts:region:DestinationBucket-account-
ID:outpost/DESTINATION-OUTPOST-ID/accesspoint/DESTINATION-OUTPOSTS-BUCKET-ACCESS-POINT/
object/*"
         ]
      }
   ]
}
```

**Note**

If objects in the source Outposts bucket are tagged, note the following:

If the source Outposts bucket owner grants S3 on Outposts permission for the `s3-outposts:GetObjectVersionTagging` and `s3-outposts:ReplicateTags` actions to replicate object tags (through the IAM role), Amazon S3 replicates the tags along with the objects. For information about the IAM role, see Creating an IAM role.

### Creating replication rules on Outposts

S3 Replication on Outposts is the automatic, asynchronous replication of objects across buckets in the same or different AWS Outposts. Replication copies newly created objects and object updates from a source Outposts bucket to a destination Outposts bucket or buckets. For more information, see Replicating objects for S3 on Outposts.

**Note**

Objects that existed in the source Outposts bucket before you set up replication rules aren't replicated. In other words, S3 on Outposts doesn't replicate objects retroactively. To replicate objects that were created before your replication configuration, you can use the `CopyObject` API operation to copy them to the same bucket. After the objects are copied, they appear as "new" objects in the bucket and the replication configuration will apply to them. For more information about copying an object, see Copying an object in an Amazon S3 on Outposts bucket using the AWS SDK for Java and CopyObject in the *Amazon Simple Storage Service API Reference*.

When you configure replication, you add replication rules to the source Outposts bucket. Replication rules define which source Outposts bucket objects to replicate and the destination Outposts bucket or buckets where the replicated objects will be stored. You can create a rule to replicate all the objects in a bucket or a subset of objects with a specific key name prefix, one or more object tags, or both. A destination Outposts bucket can be in the same Outpost as the source Outposts bucket, or it can be in a different Outpost.

For S3 on Outposts replication rules, you must provide both the source Outposts bucket's access point Amazon Resource Name (ARN) and the destination Outposts bucket's access point ARN instead of the source and destination Outposts bucket names.

If you specify an object version ID to delete, S3 on Outposts deletes that object version in the source Outposts bucket. But it doesn't replicate the deletion to the destination Outposts bucket. In

other words, it doesn't delete the same object version from the destination Outposts bucket. This behavior protects data from malicious deletions.

When you add a replication rule to an Outposts bucket, the rule is enabled by default, so the rule starts working as soon as you save it.

In this example, you set up replication for source and destination Outposts buckets that are on different Outposts and are owned by the same AWS account. Examples are provided for using the Amazon S3 console, the AWS Command Line Interface (AWS CLI), and the AWS SDK for Java and AWS SDK for .NET. For information about cross-account S3 Replication on Outposts permissions, see Granting permissions when the source and destination Outposts buckets are owned by different AWS accounts.

For prerequisites to set up S3 on Outposts replication rules, see Prerequisites for creating replication rules.

**Using the S3 console**

Follow these steps to configure a replication rule when the destination Amazon S3 on Outposts bucket is in a different Outpost from the source Outposts bucket.

If the destination Outposts bucket is in a different account from the source Outposts bucket, you must add a bucket policy to the destination Outposts bucket to grant the owner of the source Outposts bucket account permission to replicate objects in the destination Outposts bucket. For more information, see Granting permissions when the source and destination buckets are owned by different AWS accounts.

**To create a replication rule**

1. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the **Outposts Buckets** list, choose the name of the bucket that you want to use as the source bucket.
3. Choose the **Management** tab, scroll down to the **Replication rules** section, and then choose **Create replication rule**.
4. For **Replication rule name**, enter a name for your rule to help identify the rule later. The name is required and must be unique within the bucket.
5. Under **Status**, **Enabled** is chosen by default. An enabled rule starts to work as soon as you save it. If you want to enable the rule later, choose **Disabled**.

6. Under **Priority**, the rule's priority value determines which rule to apply if there are overlapping rules. When objects are included in the scope of more than one replication rule, S3 on Outposts uses these priority values to avoid conflicts. By default, new rules are added to the replication configuration at the highest priority. The higher the number, the higher the priority.

   To change the priority for the rule, after you save the rule, choose the rule name from the replication rule list, choose **Actions**, and then choose **Edit priority**.

7. Under **Source bucket**, you have the following options for setting the replication source:

   - To replicate the whole bucket, choose **Apply to *all* objects in the bucket**.
   - To apply prefix or tag filtering to the replication source, choose **Limit the scope of this rule by using one or more filters**. You can combine a prefix and tags.
     - To replicate all objects that have the same prefix, under **Prefix**, enter a prefix in the box. Using the **Prefix** filter limits replication to all objects that have names that begin with the same string (for example, `pictures`).

       If you enter a prefix that is the name of a folder, you must use a **/** (forward slash) as the last character (for example, `pictures/`).
     - To replicate all objects that have one or more of the same object tags, choose **Add tag**, and then enter the key-value pair in the boxes. To add another tag, repeat the procedure. For more information about object tags, see Adding tags for S3 on Outposts buckets.

8. To access your S3 on Outposts source bucket for replication, under **Source access point name**, choose an access point that is attached to the source bucket.

9. Under **Destination**, choose the access point ARN of the destination Outposts bucket where you want S3 on Outposts to replicate objects. The destination Outposts bucket can be in the same or a different AWS account as the source Outposts bucket.

   If the destination bucket is in a different account from the source Outposts bucket, you must add a bucket policy to the destination Outposts bucket to grant the owner of the source Outposts bucket account permission to replicate objects to the destination Outposts bucket. For more information, see Granting permissions when the source and destination Outposts buckets are owned by different AWS accounts.

> **Note**
>
> If versioning is not enabled on the destination Outposts bucket, you get a warning that contains an **Enable versioning** button. Choose this button to enable versioning on the bucket.

10. Set up an AWS Identity and Access Management (IAM) service role that S3 on Outposts can assume to replicate objects on your behalf.

    To set up an IAM role, under **IAM role**, do one of the following:

    - To have S3 on Outposts create a new IAM role for your replication configuration, choose **Choose from existing IAM roles**, and then choose **Create new role**. When you save the rule, a new policy is generated for the IAM role that matches the source and destination Outposts buckets that you choose. We recommend that you choose **Create new role**.
    - You can also choose to use an existing IAM role. If you do, you must choose a role that grants S3 on Outposts the necessary permissions for replication. If this role doesn't grant S3 on Outposts sufficient permissions to follow your replication rule, replication fails.

      To choose an existing role, choose **Choose from existing IAM roles**, and then choose the role from the dropdown menu. You can also choose **Enter an IAM role ARN** and then enter the IAM role's Amazon Resource Name (ARN).

    > **Important**
    >
    > When you add a replication rule to an S3 on Outposts bucket, you must have the `iam:CreateRole` and `iam:PassRole` permissions to be able to create and pass the IAM role that grants S3 on Outposts replication permissions. For more information, see Granting a user permissions to pass a role to an AWS service in the *IAM User Guide*.

11. All objects in Outposts buckets are encrypted by default. For more information about S3 on Outposts encryption, see Data encryption in S3 on Outposts. Only objects that are encrypted by using server-side encryption with Amazon S3 managed keys (SSE-S3) can be replicated. The replication of objects that are encrypted by using server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS) or server-side encryption with customer-provided encryption keys (SSE-C) is not supported.

12. As needed, enable the following additional options while setting the replication rule configuration:

    - If you want to enable S3 on Outposts replication metrics in your replication configuration, select **Replication metrics**. For more information, see Monitoring progress with replication metrics.
    - If you want to enable delete marker replication in your replication configuration, select **Delete marker replication**. For more information, see How delete operations affect replication.
    - If you want to replicate metadata changes made to the replicas back to the source objects, select **Replica modification sync**. For more information, see Replication status if Amazon S3 replica modification sync on Outposts is enabled.

13. To finish, choose **Create rule**.

After you save your rule, you can edit, enable, disable, or delete your rule. To do so, go to the **Management** tab for the source Outposts bucket, scroll down to the **Replication rules** section, choose your rule, and then choose **Edit rule**.

**Using the AWS CLI**

To use the AWS CLI to set up replication when the source and destination Outposts buckets are owned by the same AWS account, you do the following:

- Create source and destination Outposts buckets.
- Enable versioning on both of the buckets.
- Create an IAM role that gives S3 on Outposts permission to replicate objects.
- Add the replication configuration to the source Outposts bucket.

To verify your setup, you test it.

**To set up replication when the source and destination Outposts buckets are owned by the same AWS account**

1. Set a credentials profile for the AWS CLI. In this example, we use the profile name `acctA`. For information about setting credential profiles, see Named profiles in the *AWS Command Line Interface User Guide*.

> **Important**
>
> The profile that you use for this exercise must have the necessary permissions. For example, in the replication configuration, you specify the IAM service role that S3 on Outposts can assume. You can do this only if the profile that you use has the `iam:CreateRole` and `iam:PassRole` permissions. For more information, see Granting a user permissions to pass a role to an AWS service in the *IAM User Guide*. If you use administrator credentials to create a named profile, the named profile will have the necessary permission to perform all the tasks.

2. Create a source bucket and enable versioning on it. The following `create-bucket` command creates a *SOURCE-OUTPOSTS-BUCKET* bucket in the US East (N. Virginia) (`us-east-1`) Region. To use this command, replace the *user input placeholders* with your own information.

```
aws s3control create-bucket --bucket SOURCE-OUTPOSTS-BUCKET --outpost-id SOURCE-OUTPOST-ID --profile acctA --region us-east-1
```

   The following `put-bucket-versioning` command enables versioning on the *SOURCE-OUTPOSTS-BUCKET* bucket. To use this command, replace the *user input placeholders* with your own information.

```
aws s3control put-bucket-versioning --account-id 123456789012 --bucket arn:aws:s3-outposts:region:123456789012:outpost/SOURCE-OUTPOST-ID/bucket/SOURCE-OUTPOSTS-BUCKET --versioning-configuration Status=Enabled --profile acctA
```

3. Create a destination bucket and enable versioning on it. The following `create-bucket` command creates a *DESTINATION-OUTPOSTS-BUCKET* bucket in the US West (Oregon) (`us-west-2`) Region. To use this command, replace the *user input placeholders* with your own information.

> **Note**
>
> To set up a replication configuration when both the source and destination Outposts buckets are in the same AWS account, you use the same named profile. This example uses `acctA`. To test the replication configuration when the buckets are owned by different AWS accounts, you specify different profiles for each bucket.

```
aws s3control create-bucket --bucket DESTINATION-OUTPOSTS-BUCKET --create-bucket-
configuration LocationConstraint=us-west-2 --outpost-id DESTINATION-OUTPOST-ID --
profile acctA --region us-west-2
```

The following `put-bucket-versioning` command enables versioning on the *DESTINATION-OUTPOSTS-BUCKET* bucket. To use this command, replace the *user input placeholders* with your own information.

```
aws s3control put-bucket-versioning --account-id 123456789012 --bucket arn:aws:s3-
outposts:region:123456789012:outpost/DESTINATION-OUTPOST-ID/bucket/DESTINATION-
OUTPOSTS-BUCKET --versioning-configuration Status=Enabled --profile acctA
```

4. Create an IAM service role. Later in the replication configuration, you add this service role to the *SOURCE-OUTPOSTS-BUCKET* bucket. S3 on Outposts assumes this role to replicate objects on your behalf. You create an IAM role in two steps:

   a. Create an IAM role.

      i. Copy the following trust policy and save it to a file named `s3-on-outposts-role-trust-policy.json` in the current directory on your local computer. This policy grants S3 on Outposts service principal permissions to assume the service role.

```
{
   "Version":"2012-10-17",
   "Statement":[
      {
         "Effect":"Allow",
         "Principal":{
            "Service":"s3-outposts.amazonaws.com"
         },
         "Action":"sts:AssumeRole"
      }
   ]
}
```

      ii. Run the following command to create the role. Replace the *user input placeholders* with your own information.

```
aws iam create-role --role-name replicationRole --assume-role-policy-
document file://s3-on-outposts-role-trust-policy.json --profile acctA
```

b. Attach a permissions policy to the service role.

i. Copy the following permissions policy and save it to a file named `s3-on-outposts-role-permissions-policy.json` in the current directory on your local computer. This policy grants permissions for various S3 on Outposts bucket and object actions. To use this policy, replace the *`user input placeholders`* with your own information.

```
{
   "Version":"2012-10-17",
   "Statement":[
      {
         "Effect":"Allow",
         "Action":[
            "s3-outposts:GetObjectVersionForReplication",
            "s3-outposts:GetObjectVersionTagging"
         ],
         "Resource":[
            "arn:aws:s3-outposts:region:123456789012:outpost/SOURCE-
OUTPOST-ID/bucket/SOURCE-OUTPOSTS-BUCKET/object/*",
            "arn:aws:s3-outposts:region:123456789012:outpost/SOURCE-
OUTPOST-ID/accesspoint/SOURCE-OUTPOSTS-BUCKET-ACCESS-POINT/object/*"
         ]
      },
      {
         "Effect":"Allow",
         "Action":[
            "s3-outposts:ReplicateObject",
            "s3-outposts:ReplicateDelete"
         ],
         "Resource":[
            "arn:aws:s3-outposts:region:123456789012:outpost/DESTINATION-
OUTPOST-ID/bucket/DESTINATION-OUTPOSTS-BUCKET/object/*",
            "arn:aws:s3-outposts:region:123456789012:outpost/DESTINATION-
OUTPOST-ID/accesspoint/DESTINATION-OUTPOSTS-BUCKET-ACCESS-POINT/object/*"
         ]
      }
   ]
```

```
}
```

ii. Run the following command to create a policy and attach it to the role. Replace the *user input placeholders* with your own information.

```
aws iam put-role-policy --role-name replicationRole --policy-
document file://s3-on-outposts-role-permissions-policy.json --policy-
name replicationRolePolicy --profile acctA
```

5. Add a replication configuration to the *SOURCE-OUTPOSTS-BUCKET* bucket.

a. Although the S3 on Outposts API requires a replication configuration in XML format, the AWS CLI requires that you specify the replication configuration in JSON format. Save the following JSON in a file called `replication.json` to the local directory on your computer. To use this configuration, replace the *user input placeholders* with your own information.

```
{
  "Role": "IAM-role-ARN",
  "Rules": [
    {
      "Status": "Enabled",
      "Priority": 1,
      "DeleteMarkerReplication": { "Status": "Disabled" },
      "Filter" : { "Prefix": "Tax"},
      "Destination": {
        "Bucket":
        "arn:aws:s3-outposts:region:123456789012:outpost/DESTINATION-OUTPOST-
ID/accesspoint/DESTINATION-OUTPOSTS-BUCKET-ACCESS-POINT"
      }
    }
  ]
}
```

b. Run the following `put-bucket-replication` command to add the replication configuration to your source Outposts bucket. To use this command, replace the *user input placeholders* with your own information.

```
aws s3control put-bucket-replication --account-id 123456789012 --
bucket arn:aws:s3-outposts:region:123456789012:outpost/SOURCE-OUTPOST-
```

```
ID/bucket/SOURCE-OUTPOSTS-BUCKET --replication-configuration file://
replication.json --profile acctA
```

c. To retrieve the replication configuration, use the `get-bucket-replication` command. To use this command, replace the *`user input placeholders`* with your own information.

```
aws s3control get-bucket-replication --account-id 123456789012 --bucket
 arn:aws:s3-outposts:region:123456789012:outpost/SOURCE-OUTPOST-ID/
bucket/SOURCE-OUTPOSTS-BUCKET --profile acctA
```

6. Test the setup in the Amazon S3 console:

   a. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.

   b. In the *`SOURCE-OUTPOSTS-BUCKET`* bucket, create a folder named `Tax`.

   c. Add sample objects to the `Tax` folder in the *`SOURCE-OUTPOSTS-BUCKET`* bucket.

   d. In the *`DESTINATION-OUTPOSTS-BUCKET`* bucket, verify the following:

   - S3 on Outposts replicated the objects.

     **Note**

     The amount of time that it takes for S3 on Outposts to replicate an object depends on the size of the object. For information about how to see the status of replication, see Getting replication status information.

   - On the object's **Properties** tab, the **Replication status** is set to **Replica** (identifying this as a replica object).

## Managing your replication

This section describes additional replication configuration options that are available in S3 on Outposts, how to determine the replication status, and how to troubleshot replication. For information about core replication configuration, see Setting up replication.

### Topics

- Monitoring progress with replication metrics

- Getting replication status information
- Troubleshooting replication
- Using EventBridge for S3 Replication on Outposts

### Monitoring progress with replication metrics

S3 Replication on Outposts provides detailed metrics for the replication rules in your replication configuration. With replication metrics, you can monitor in 5-minute intervals the progress of replication by tracking bytes pending replication, replication latency replication, and operations pending. To assist in troubleshooting any configuration issues, you can also set up Amazon EventBridge to receive notifications about replication failures.

When replication metrics are enabled, S3 Replication on Outposts publishes the following metrics to Amazon CloudWatch:

- **Bytes Pending Replication** – The total number of bytes of objects that are pending replication for a given replication rule.
- **Replication Latency** – The maximum number of seconds by which the replication destination bucket is behind the source bucket for a given replication rule.
- **Operations Pending Replication** – The number of operations that are pending replication for a given replication rule. Operations include objects, delete markers, and tags.

> **Note**
>
> S3 Replication on Outposts metrics are billed at the same rate as CloudWatch custom metrics. For more information, see CloudWatch pricing.

### Getting replication status information

The replication status can help you determine the current state of an object that's being replicated by Amazon S3 on Outposts. The replication status of a source object will return either `PENDING`, `COMPLETED`, or `FAILED`. The replication status of a replica will return `REPLICA`.

### Replication status overview

In a replication scenario, you have a source bucket on which you configure replication and a destination bucket to which S3 on Outposts replicates objects. When you request an object (using

GetObject) or object metadata (using HeadObject) from these buckets, S3 on Outposts returns the x-amz-replication-status header in the response as follows:

- When you request an object from the source bucket, S3 on Outposts returns the x-amz-replication-status header if the object in your request is eligible for replication.

  For example, suppose that you specify the object prefix TaxDocs in your replication configuration to tell S3 on Outposts to replicate only objects with the key name prefix TaxDocs. Any objects that you upload that have this key name prefix—for example, TaxDocs/document1.pdf—will be replicated. For object requests with this key name prefix, S3 on Outposts returns the x-amz-replication-status header with one of the following values for the object's replication status: PENDING, COMPLETED, or FAILED.

  > **Note**
  >
  > If object replication fails after you upload an object, you can't retry replication. You must upload the object again. Objects transition to a FAILED state for issues such as missing replication role permissions or missing bucket permissions. For temporary failures, such as if a bucket or your Outpost is unavailable, the replication status doesn't transition to FAILED, but remains PENDING. After the resource is back online, S3 on Outposts resumes replicating those objects.

- When you request an object from a destination bucket, if the object in your request is a replica that S3 on Outposts created, S3 on Outposts returns the x-amz-replication-status header with the value REPLICA.

> **Note**
>
> Before deleting an object from a source bucket that has replication enabled, check the object's replication status to ensure that the object has been replicated.

### Replication status if Amazon S3 replica modification sync on Outposts is enabled

When your replication rules enable S3 on Outposts replica modification sync, replicas can report statuses other than REPLICA. If metadata changes are in the process of replicating, the x-amz-replication-status header for the replica returns PENDING. If replica modification sync fails to

replicate metadata, the header for the replica returns `FAILED`. If metadata is replicated correctly, the header for the replica returns the value `REPLICA`.

**Troubleshooting replication**

If object replicas don't appear in the destination Amazon S3 on Outposts bucket after you configure replication, use these troubleshooting tips to identify and fix issues.

- The time it takes S3 on Outposts to replicate an object depends on several factors, including the distance between the source and destination Outposts, and the size of the object.

  You can check the source object's replication status. If the object's replication status is `PENDING`, S3 on Outposts hasn't completed the replication. If the object's replication status is `FAILED`, check the replication configuration that you set on the source bucket.
- In the replication configuration on the source bucket, verify the following:
  - The access point Amazon Resource Name (ARN) of the destination bucket is correct.
  - The key name prefix is correct. For example, if you set the configuration to replicate objects with the prefix `Tax`, then only objects with key names such as `Tax/document1` or `Tax/document2` are replicated. An object with the key name `document3` is not replicated.
  - The status is `Enabled`.
- Verify that versioning hasn't been suspended on either bucket. Both the source and destination buckets must have versioning enabled.
- If the destination bucket is owned by another AWS account, verify that the bucket owner has a bucket policy on the destination bucket that allows the source bucket owner to replicate objects. For an example, see Granting permissions when the source and destination Outposts buckets are owned by different AWS accounts.
- If an object replica doesn't appear in the destination bucket, the following issues might prevent replication:
  - S3 on Outposts doesn't replicate an object in a source bucket that is a replica created by another replication configuration. For example, if you set a replication configuration from bucket A to bucket B to bucket C, S3 on Outposts doesn't replicate object replicas in bucket B to bucket C.

    If you want to replicate objects in bucket A to bucket B and bucket C, set multiple bucket destinations in different replication rules for your source bucket replication configuration. For example, create two replication rules on source bucket A, with one rule to replicate to destination bucket B and the other rule to replicate to destination bucket C.

  - A source bucket owner can grant other AWS accounts permission to upload objects. By default, the source bucket owner doesn't have permissions for the objects created by other accounts. The replication configuration replicates only the objects for which the source bucket owner has access permissions. To avoid replication issues, the source bucket owner can grant other AWS accounts permissions to create objects conditionally, requiring explicit access permissions on those objects. For an example policy, see Grant cross-account permissions to upload objects while ensuring that the bucket owner has full control.
- Suppose that in the replication configuration, you add a rule to replicate a subset of objects that have a specific tag. In this case, you must assign the specific tag key and value at the time that the object is created in order for S3 on Outposts to replicate the object. If you first create an object and then add the tag to that existing object, S3 on Outposts doesn't replicate the object.
- Replication fails if the bucket policy denies access to the replication role for any of the following actions:

  Source bucket:

  ```
  "s3-outposts:GetObjectVersionForReplication",
  "s3-outposts:GetObjectVersionTagging"
  ```

  Destination buckets:

  ```
  "s3-outposts:ReplicateObject",
  "s3-outposts:ReplicateDelete",
  "s3-outposts:ReplicateTags"
  ```
- Amazon EventBridge can notify you when objects don't replicate to their destination Outposts. For more information, see Using EventBridge for S3 Replication on Outposts.

### Using EventBridge for S3 Replication on Outposts

Amazon S3 on Outposts is integrated with Amazon EventBridge and uses the `s3-outposts` namespace. EventBridge is a serverless event bus service that you can use to connect your applications with data from a variety of sources. For more information, see What is Amazon EventBridge? in the *Amazon EventBridge User Guide*.

To assist in troubleshooting any replication configuration issues, you can set up Amazon EventBridge to receive notifications about replication failure events. EventBridge can notify you in

instances when objects don't replicate to their destination Outposts. For more information about the current state of an object that's being replicated, see Replication status overview.

Whenever certain events happen in your Outposts bucket, S3 on Outposts can send events to EventBridge. Unlike other destinations, you don't need to select which event types that you want to deliver. You can also use EventBridge rules to route events to additional targets. After EventBridge is enabled, S3 on Outposts sends all of the following events to EventBridge.

| Event type | Description | Namespace |
| --- | --- | --- |
| `Operation FailedReplication` | The replication of an object within a replication rule failed. For more information about S3 Replication on Outposts failure reasons, see Using EventBridge to view S3 Replication on Outposts failure reasons. | `s3-outposts` |

### Using EventBridge to view S3 Replication on Outposts failure reasons

The following table lists S3 Replication on Outposts failure reasons. You can configure an EventBridge rule to publish and view the failure reason through Amazon Simple Queue Service (Amazon SQS), Amazon Simple Notification Service (Amazon SNS), AWS Lambda, or Amazon CloudWatch Logs. For more information about the permissions that are required to use these resources for EventBridge, see Using resource-based policies for EventBridge.

| Replication failure reason | Description |
| --- | --- |
| `AssumeRoleNotPermitted` | S3 on Outposts can't assume the AWS Identity and Access Management (IAM) role that's specified in the replication configuration. |
| `DstBucketNotFound` | S3 on Outposts can't find the destination bucket that's specified in the replication configuration. |
| `DstBucketUnversioned` | Versioning isn't enabled on the Outposts destination bucket. To replicate objects with |

| Replication failure reason | Description |
| --- | --- |
| | S3 Replication on Outposts, you must enable versioning on the destination bucket. |
| DstDelObjNotPermitted | S3 on Outposts can't replicate deletes to the destination bucket. The s3-outposts:ReplicateDelete permission might be missing for the destination bucket. |
| DstMultipartCompleteNotPermitted | S3 on Outposts can't complete a multipart upload of objects in the destination bucket. The s3-outposts:ReplicateObject permission might be missing for the destination bucket. |
| DstMultipartInitNotPermitted | S3 on Outposts can't initiate a multipart upload of objects to the destination bucket. The s3-outposts:ReplicateObject permission might be missing for the destination bucket. |
| DstMultipartPartUploadNotPermitted | S3 on Outposts can't upload multipart objects in the destination bucket. The s3-outposts:ReplicateObject permission might be missing for the destination bucket. |
| DstOutOfCapacity | S3 on Outposts can't replicate to the destination Outpost because the Outpost is out of S3 storage capacity. |
| DstPutObjNotPermitted | S3 on Outposts can't replicate objects to the destination bucket. The s3-outposts:ReplicateObject permission might be missing for the destination bucket. |

| Replication failure reason | Description |
| --- | --- |
| DstPutTaggingNotPermitted | S3 on Outposts can't replicate object tags to the destination bucket. The s3-outposts:ReplicateObject permission might be missing for the destination bucket. |
| DstVersionNotFound | S3 on Outposts can't find the required object version in the destination bucket in order to replicate that object version's metadata. |
| SrcBucketReplicationConfigMissing | S3 on Outposts can't find a replication configuration for the access point that's associated with the source Outposts bucket. |
| SrcGetObjNotPermitted | S3 on Outposts can't access the object in the source bucket for replication. The s3-outposts:GetObjectVersionForReplication permission might be missing for the source bucket. |
| SrcGetTaggingNotPermitted | S3 on Outposts can't access the object tag information from the source bucket. The s3-outposts:GetObjectVersionTagging permission might be missing for the source bucket. |
| SrcHeadObjectNotPermitted | S3 on Outposts can't retrieve object metadata from the source bucket. The s3-outposts:GetObjectVersionForReplication permission might be missing for the source bucket. |
| SrcObjectNotEligible | The object isn't eligible for replication. The object or its object tags don't match the replication configuration. |

For more information about troubleshooting replication, see the following topics:

- Creating an IAM role
- Troubleshooting replication

**Monitoring EventBridge with CloudWatch**

For monitoring, Amazon EventBridge integrates with Amazon CloudWatch. EventBridge automatically sends metrics to CloudWatch every minute. These metrics include the number of events that have been matched by a rule and the number of times a target is invoked by a rule. When a rule runs in EventBridge, all of the targets associated with the rule are invoked. You can monitor your EventBridge behavior through CloudWatch in the following ways.

- You can monitor the available EventBridge metrics for your EventBridge rules from the CloudWatch dashboard. Then, you can use CloudWatch features, such as CloudWatch alarms, to set alarms on certain metrics. If those metrics reach the custom threshold values that you've specified in the alarms, you receive notifications and can take action accordingly.
- You can set Amazon CloudWatch Logs as a target of your EventBridge rule. Then, EventBridge creates log streams and CloudWatch Logs stores the text from the events as log entries. For more information, see EventBridge and CloudWatch Logs.

For more information about debugging EventBridge event delivery and archiving events, see the following topics:

- Event retry policy and using dead-letter queues
- Archiving EventBridge events

## Sharing S3 on Outposts by using AWS RAM

Amazon S3 on Outposts supports sharing S3 capacity across multiple accounts within an organization by using AWS Resource Access Manager (AWS RAM). With S3 on Outposts sharing, you can allow others to create and manage buckets, endpoints, and access points on your Outpost.

This topic demonstrates how to use AWS RAM to share S3 on Outposts and related resources with another AWS account in your AWS organization.

## Prerequisites

- The Outpost owner account has an organization configured in AWS Organizations. For more information, see Creating an organization in the *AWS Organizations User Guide*.
- The organization includes the AWS account that you want to share your S3 on Outposts capacity with. For more information, see Sending invitations to AWS accounts in the *AWS Organizations User Guide*.
- Select one of the following options that you want to share. The second resource (either **Subnets** or **Outposts**) must be selected so that endpoints are also accessible. Endpoints are a networking requirement in order to access data stored in S3 on Outposts.

| Option 1 | Option 2 |
| --- | --- |
| **S3 on Outposts**<br><br>Allows the user to create buckets on your Outposts and access points and to add objects to those buckets. | **S3 on Outposts**<br><br>Allows the user to create buckets on your Outposts and access points and to add objects to those buckets. |
| **Subnets**<br><br>Allows the user to use your virtual private cloud (VPC) and the endpoints that are associated with your subnet. | **Outposts**<br><br>Allows the user to see S3 capacity charts and the AWS Outposts console home page. Also allows users to create subnets on shared Outposts and create endpoints. |

## Procedure

1. Sign in to the AWS Management Console by using the AWS account that owns the Outpost, and then open the AWS RAM console at https://console.aws.amazon.com/ram.
2. Make sure that you have enabled sharing with AWS Organizations in AWS RAM. For information, see Enable resource sharing within AWS Organizations in the *AWS RAM User Guide*.
3. Use either Option 1 or Option 2 in the prerequisites to create a resource share. If you have multiple S3 on Outposts resources, select the Amazon Resource Names (ARNs) of the resources that you want to share. To enable endpoints, share either your subnet or Outpost.

For more information about how to create a resource share, see Create a resource share in the *AWS RAM User Guide*.

4. The AWS account that you shared your resources with should now be able to use S3 on Outposts. Depending on the option that you selected in the prerequisites, provide the following information to the account user:

| Option 1 | Option 2 |
| --- | --- |
| The Outpost ID | The Outpost ID |
| The VPC ID | |
| The subnet ID | |
| The security group ID | |

> **Note**
>
> The user can confirm that the resources have been shared with them by using the AWS RAM console, the AWS Command Line Interface (AWS CLI), AWS SDKs, or REST API. The user can view their existing resource shares by using the get-resource-shares CLI command.

## Usage examples

After you have shared your S3 on Outposts resources with another account, that account can manage buckets and objects on your Outpost. If you shared the **Subnets** resource, then that account can use the endpoint that you created. The following examples demonstrate how a user can use the AWS CLI to interact with your Outpost after you share these resources.

**Example : Create a bucket**

The following example creates a bucket named *amzn-s3-demo-bucket1* on the Outpost *op-01ac5d28a6a232904*. Before using this command, replace each *user input placeholder* with the appropriate values for your use case.

```
aws s3control create-bucket --bucket amzn-s3-demo-bucket1 --outpost-
id op-01ac5d28a6a232904
```

For more information about this command, see create-bucket in the *AWS CLI Reference*.

**Example : Create an access point**

The following example creates an access point on an Outpost by using the example parameters in the following table. Before using this command, replace these *user input placeholder* values and the AWS Region code with the appropriate values for your use case.

| Parameter | Value |
| --- | --- |
| Account ID | *111122223333* |
| Access point name | *example-outpost-access-point* |
| Outpost ID | *op-01ac5d28a6a232904* |
| Outpost bucket name | *amzn-s3-demo-bucket1* |
| VPC ID | *vpc-1a2b3c4d5e6f7g8h9* |

**Note**

The Account ID parameter must be the AWS account ID of the bucket owner, which is the shared user.

```
aws s3control create-access-point --account-id 111122223333 --name example-outpost-
access-point \
--bucket arn:aws:s3-outposts:us-east-1:111122223333:outpost/op-01ac5d28a6a232904/
bucket/amzn-s3-demo-bucket1 \
--vpc-configuration VpcId=vpc-1a2b3c4d5e6f7g8h9
```

For more information about this command, see create-access-point in the *AWS CLI Reference*.

### Example : Upload an object

The following example uploads the file *my_image.jpg* from the user's local file system to an object named *images/my_image.jpg* through the access point *example-outpost-access-point* on the Outpost *op-01ac5d28a6a232904*, owned by the AWS account *111122223333*. Before using this command, replace these *user input placeholder* values and the AWS Region code with the appropriate values for your use case.

```
aws s3api put-object --bucket arn:aws:s3-outposts:us-east-1:111122223333:outpost/op-01ac5d28a6a232904/accesspoint/example-outpost-access-point \
--body my_image.jpg --key images/my_image.jpg
```

For more information about this command, see put-object in the *AWS CLI Reference*.

> **Note**
>
> If this operation results in a Resource not found error or is unresponsive, your VPC might not have a shared endpoint.
> To check whether there is a shared endpoint, use the list-shared-endpoints AWS CLI command. If there is no shared endpoint, work with the Outpost owner to create one.
> For more information, see ListSharedEndpoints in the *Amazon Simple Storage Service API Reference*.

### Example : Create an endpoint

The following example creates an endpoint on a shared Outpost. Before using this command, replace the *user input placeholder* values for the Outpost ID, subnet ID, and security group ID with the appropriate values for your use case.

> **Note**
>
> The user can perform this operation only if the resource share includes the **Outposts** resource.

```
aws s3outposts create-endpoint --outposts-id op-01ac5d28a6a232904 --subnet-id XXXXXX --security-group-id XXXXXXX
```

For more information about this command, see create-endpoint in the *AWS CLI Reference*.

## Other AWS services that use S3 on Outposts

Other AWS services that run local to your AWS Outposts can also use your Amazon S3 on Outposts capacity. In Amazon CloudWatch the `S3Outposts` namespace shows detailed metrics for buckets within S3 on Outposts, but these metrics don't include usage for other AWS services. To manage your S3 on Outposts capacity that is consumed by other AWS services, see the information in the following table.

| AWS service | Description | Learn more |
| --- | --- | --- |
| Amazon S3 | All direct S3 on Outposts usage has a matching account and bucket CloudWatch metric. | See metrics |
| Amazon Elastic Block Store (Amazon EBS) | For Amazon EBS on Outposts, you can choose an AWS Outpost as your snapshot destination and store locally in your S3 on Outpost. | Learn more |
| Amazon Relationa l Database Service (Amazon RDS) | You can use Amazon RDS local backups to store your RDS backups locally on your Outpost. | Learn more |

# Monitoring S3 on Outposts

With Amazon S3 on Outposts, you can create S3 buckets on your AWS Outposts and easily store and retrieve objects on premises for applications that require local data access, local data processing, and data residency. S3 on Outposts provides a new storage class, S3 Outposts (0UTP0STS), which uses the Amazon S3 APIs, and is designed to store data durably and redundantly across multiple devices and servers on your AWS Outposts. You communicate with your Outpost bucket by using an access point and endpoint connection over a virtual private cloud (VPC). You can use the same APIs and features on Outpost buckets as you do on Amazon S3 buckets, including access policies, encryption, and tagging. You can use S3 on Outposts through the AWS Management Console, AWS Command Line Interface (AWS CLI), AWS SDKs, or REST API. For more information, see What is Amazon S3 on Outposts?

For more information about monitoring your Amazon S3 on Outposts storage capacity, see the following topics.

**Topics**

# Managing S3 on Outposts capacity with Amazon CloudWatch metrics

To help manage the fixed S3 capacity on your Outpost, we recommend that you create CloudWatch alerts that tell you when your storage utilization exceeds a certain threshold. For more information about the CloudWatch metrics for S3 on Outposts, see CloudWatch metrics. If there is not enough space to store an object on your Outpost, the API returns an insufficient capacity exemption (ICE). To free up space, you can create CloudWatch alarms that trigger explicit data deletion, or use a lifecycle expiration policy to expire objects. To save data before deletion, you can use AWS DataSync to copy data from your Amazon S3 on Outposts bucket to an S3 bucket in an AWS Region. For more information about using DataSync, see Getting Started with AWS DataSync in the *AWS DataSync User Guide*.

## CloudWatch metrics

The `S3Outposts` namespace includes the following metrics for Amazon S3 on Outposts buckets. You can monitor the total number of S3 on Outposts bytes provisioned, the total free bytes available for objects, and the total size of all objects for a given bucket. Bucket or account-related metrics exist for all direct S3 usage. Indirect S3 usage, such as storing Amazon Elastic Block Store local snapshots or Amazon Relational Database Service backups on an Outpost, consumes S3 capacity, but is not included in bucket or account-related metrics. For more information about Amazon EBS local snapshots, see Amazon EBS local snapshots on Outposts. To see your Amazon EBS cost report, visit https://console.aws.amazon.com/billing/.

> **Note**
>
> S3 on Outposts supports only the following metrics, and no other Amazon S3 metrics. Because S3 on Outposts has a fixed capacity limit, we recommend creating CloudWatch alarms to notify you when your storage utilization exceeds a certain threshold.

| Metric | Description | Time Period | Units | Type |
|---|---|---|---|---|
| `Outpost`<br>`talByte` | The total provisioned capacity in bytes for an Outpost. | 5 minutes | Bytes | S3 on Outposts |
| `Outpostl`<br>`eeBytes` | The count of free bytes available on an Outpost to store customer data. | 5 minutes | Bytes | S3 on Outposts |
| `BucketU`<br>`dBytes` | The total size of all objects for the given bucket. | 5 minutes | Bytes | S3 on Outposts. Direct S3 usage only. |
| `Accountl`<br>`edBytes` | The total size of all objects for the specified Outposts account. | 5 minutes | Bytes | S3 on Outposts. Direct S3 usage only. |
| `BytesPe`<br>`ingRepl`<br>`ation` | The total number of bytes of objects that are pending replication for a given replication rule. For more information about how to enable replication metrics, see Creating replication rules between Outposts. | 5 minutes | Bytes | Optional. For S3 Replication on Outposts. |
| `Operati`<br>`sPendin`<br>`eplicat`<br>`n` | The total number of operations that are pending replication for a given replication rule. For more information about how to enable replication metrics, see Creating replication rules between Outposts. | 5 minutes | Counts | Optional. For S3 Replication on Outposts. |
| `Replica`<br>`onLaten` | The current number of seconds delay by which the replication destination bucket | 5 minutes | Seconds | Optional. For S3 Replication on Outposts. |

| Metric | Description | Time Period | Units | Type |
| --- | --- | --- | --- | --- |
| | is behind the source bucket for a given replication rule. For more information about how to enable replication metrics, see Creating replication rules between Outposts. | | | |

## Receiving S3 on Outposts event notifications by using Amazon CloudWatch Events

You can use CloudWatch Events to create a rule for any Amazon S3 on Outposts API event. When you create a rule, you can choose to get notified through all supported CloudWatch targets, including Amazon Simple Queue Service (Amazon SQS), Amazon Simple Notification Service (Amazon SNS), and AWS Lambda. For more information, see the list of AWS services that can be targets for CloudWatch Events in the *Amazon CloudWatch Events User Guide*. To choose a target service to work with your S3 on Outposts, see Creating a CloudWatch Events rule that triggers on an AWS API call using AWS CloudTrail in the *Amazon CloudWatch Events User Guide*.

> **Note**
>
> For S3 on Outposts object operations, AWS API call events sent by CloudTrail will match your rules only if you have trails (optionally with event selectors) configured to receive those events. For more information, see Working with CloudTrail log files in the *AWS CloudTrail User Guide*.

### Example

The following is a sample rule for the `DeleteObject` operation. To use this sample rule, replace *`amzn-s3-demo-bucket1`* with the name of your S3 on Outposts bucket.

```
{
  "source": [
    "aws.s3-outposts"
```

```
  ],
  "detail-type": [
    "AWS API call through CloudTrail"
  ],
  "detail": {
    "eventSource": [
      "s3-outposts.amazonaws.com"
    ],
    "eventName": [
      "DeleteObject"
    ],
    "requestParameters": {
      "bucketName": [
        "amzn-s3-demo-bucket1"
      ]
    }
  }
}
```

## Monitoring S3 on Outposts with AWS CloudTrail logs

Amazon S3 on Outposts is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in S3 on Outposts. You can use AWS CloudTrail to get information about S3 on Outposts bucket-level and object-level requests to audit and log your S3 on Outposts event activity. To enable CloudTrail data events for all your Outposts buckets or for a list of specific Outposts buckets, you must create a trail manually in CloudTrail. For more information about CloudTrail log file entries, see S3 on Outposts log file entries.

**Note**

- It's a best practice to create a lifecycle policy for your AWS CloudTrail data event Outposts bucket. Configure the lifecycle policy to periodically remove log files after the period of time that you need to audit them. Doing so reduces the amount of data that Amazon Athena analyzes for each query. For more information, see Setting a lifecycle configuration on a bucket.
- For examples of how to query CloudTrail logs, see the *AWS Big Data Blog* post Analyze Security, Compliance, and Operational Activity Using AWS CloudTrail and Amazon Athena.

## Enable CloudTrail logging for objects in an S3 on Outposts bucket

You can use the Amazon S3 console to configure an AWS CloudTrail trail to log data events for objects in an Amazon S3 on Outposts bucket. CloudTrail supports logging S3 on Outposts object-level API operations such as `GetObject`, `DeleteObject`, and `PutObject`. These events are called *data events*.

By default, CloudTrail trails don't log data events. However, you can configure trails to log data events for S3 on Outposts buckets that you specify, or to log data events for all the S3 on Outposts buckets in your AWS account. For more information, see Logging Amazon S3 API calls using AWS CloudTrail.

CloudTrail does not populate data events in the CloudTrail event history. Additionally, not all S3 on Outposts bucket–level API operations are populated in the CloudTrail event history. For more information about how to query CloudTrail logs, see Using Amazon CloudWatch Logs filter patterns and Amazon Athena to query CloudTrail logs on the AWS Knowledge Center.

To configure a trail to log data events for an S3 on Outposts bucket, you can use either the AWS CloudTrail console or the Amazon S3 console. If you are configuring a trail to log data events for all the S3 on Outposts buckets in your AWS account, it's easier to use the CloudTrail console. For information about using the CloudTrail console to configure a trail to log S3 on Outposts data events, see Data events in the *AWS CloudTrail User Guide*.

**Important**

Additional charges apply for data events. For more information, see AWS CloudTrail pricing.

The following procedure shows how to use the Amazon S3 console to configure a CloudTrail trail to log data events for an S3 on Outposts bucket.

**Note**

The AWS account that creates the bucket owns it and is the only one that can configure S3 on Outposts data events to be sent to AWS CloudTrail.

**To enable CloudTrail data events logging for objects in an S3 on Outposts bucket**

1. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Outposts buckets**.
3. Choose the name of the Outposts bucket whose data events you want to log by using CloudTrail.
4. Choose **Properties**.
5. In the **AWS CloudTrail data events** section, choose **Configure in CloudTrail**.

   The AWS CloudTrail console opens.

   You can create a new CloudTrail trail or reuse an existing trail and configure S3 on Outposts data events to be logged in your trail.
6. On the CloudTrail console **Dashboard** page, choose **Create trail**.
7. On the **Step 1 Choose trail attributes** page, provide a name for the trail, choose an S3 bucket to store trail logs, specify any other settings that you want, and then choose **Next**.
8. On the **Step 2 Choose log events** page, under **Event type**, choose **Data events**.

   For **Data event type**, choose **S3 Outposts**. Choose **Next**.

   **Note**

   - When you create a trail and configure data event logging for S3 on Outposts, you must specify the data event type correctly.
     - If you use the CloudTrail console, choose **S3 Outposts** for **Data event type**. For information about how to create trails in the CloudTrail console, see Creating and updating a trail with the console in the *AWS CloudTrail User Guide*. For information about how to configure S3 on Outposts data event logging in the CloudTrail console, see Logging data events for Amazon S3 Objects in the *AWS CloudTrail User Guide*.
     - If you use the AWS Command Line Interface (AWS CLI) or the AWS SDKs, set the `resources.type` field to `AWS::S3Outposts::Object`. For more information about how to log S3 on Outposts data events with the AWS CLI, see Log S3 on Outposts events in the *AWS CloudTrail User Guide*.

- If you use the CloudTrail console or the Amazon S3 console to configure a trail to log data events for an S3 on Outposts bucket, the Amazon S3 console shows that object-level logging is enabled for the bucket.

9. On the **Step 3 Review and create** page, review the trail attributes and the log events that you configured. Then, choose **Create trail**.

**To disable CloudTrail data events logging for objects in an S3 on Outposts bucket**

1. Sign in to the AWS Management Console and open the CloudTrail console at https://console.aws.amazon.com/cloudtrail/.
2. In the left navigation pane, choose **Trails**.
3. Choose the name of the trail that you created to log events for your S3 on Outposts bucket.
4. On the details page for your trail, choose **Stop logging** in the upper-right corner.
5. In the dialog box that appears, choose **Stop logging**.

# Developing with Amazon S3 on Outposts

With Amazon S3 on Outposts, you can create S3 buckets on your AWS Outposts and easily store and retrieve objects on premises for applications that require local data access, local data processing, and data residency. S3 on Outposts provides a new storage class, S3 Outposts (OUTPOSTS), which uses the Amazon S3 APIs, and is designed to store data durably and redundantly across multiple devices and servers on your AWS Outposts. You communicate with your Outpost bucket by using an access point and endpoint connection over a virtual private cloud (VPC). You can use the same APIs and features on Outpost buckets as you do on Amazon S3 buckets, including access policies, encryption, and tagging. You can use S3 on Outposts through the AWS Management Console, AWS Command Line Interface (AWS CLI), AWS SDKs, or REST API. For more information, see What is Amazon S3 on Outposts?

The following topics provide information about developing with S3 on Outposts.

**Topics**

- Amazon S3 on Outposts API operations
- Configure the S3 control client for S3 on Outposts by using the SDK for Java
- Making requests to S3 on Outposts over IPv6

# Amazon S3 on Outposts API operations

This topic lists the Amazon S3, Amazon S3 Control, and Amazon S3 on Outposts API operations that you can use with Amazon S3 on Outposts.

**Topics**

## Amazon S3 API operations for managing objects

S3 on Outposts is designed to use the same object API operations as Amazon S3. You must use access points to access any object in an Outpost bucket. When you use an object API operation with S3 on Outposts, you provide either the Outposts access point Amazon Resource Name (ARN) or the access point alias. For more information about access point aliases, see Using a bucket-style alias for your S3 on Outposts bucket access point.

Amazon S3 on Outposts supports the following Amazon S3 API operations:

- AbortMultipartUpload
- CompleteMultipartUpload
- CopyObject
- CreateMultipartUpload
- DeleteObject
- DeleteObjects
- DeleteObjectTagging
- GetObject
- GetObjectTagging
- HeadBucket
- HeadObject
- ListMultipartUploads
- ListObjects
- ListObjectsV2

- ListObjectVersions
- ListParts
- PutObject
- PutObjectTagging
- UploadPart
- UploadPartCopy

## Amazon S3 Control API operations for managing buckets

S3 on Outposts supports the following Amazon S3 Control API operations for working with buckets.

- CreateAccessPoint
- CreateBucket
- DeleteAccessPoint
- DeleteAccessPointPolicy
- DeleteBucket
- DeleteBucketLifecycleConfiguration
- DeleteBucketPolicy
- DeleteBucketReplication
- DeleteBucketTagging
- GetAccessPoint
- GetAccessPointPolicy
- GetBucket
- GetBucketLifecycleConfiguration
- GetBucketPolicy
- GetBucketReplication
- GetBucketTagging
- GetBucketVersioning
- ListAccessPoints
- ListRegionalBuckets
- PutAccessPointPolicy

- PutBucketLifecycleConfiguration
- PutBucketPolicy
- PutBucketReplication
- PutBucketTagging
- PutBucketVersioning

### S3 on Outposts API operations for managing Outposts

S3 on Outposts supports the following Amazon S3 on Outposts API operations for managing endpoints.

- CreateEndpoint
- DeleteEndpoint
- ListEndpoints
- ListOutpostsWithS3
- ListSharedEndpoints

## Configure the S3 control client for S3 on Outposts by using the SDK for Java

The following example configures the Amazon S3 control client for Amazon S3 on Outposts by using the AWS SDK for Java. To use this example, replace each *`user input placeholder`* with your own information.

```
import com.amazonaws.auth.AWSStaticCredentialsProvider;
import com.amazonaws.auth.BasicAWSCredentials;
import com.amazonaws.services.s3control.AWSS3Control;
import com.amazonaws.services.s3control.AWSS3ControlClient;

public AWSS3Control createS3ControlClient() {

    String accessKey = AWSAccessKey;
    String secretKey = SecretAccessKey;
    BasicAWSCredentials awsCreds = new BasicAWSCredentials(accessKey, secretKey);

    return AWSS3ControlClient.builder().enableUseArnRegion()
            .withCredentials(new AWSStaticCredentialsProvider(awsCreds))
```

```
            .build();

}
```

## Making requests to S3 on Outposts over IPv6

Amazon S3 on Outposts and S3 on Outposts dual-stack endpoints support requests to S3 on Outposts buckets using either the IPv6 or IPv4 protocol. With IPv6 support for S3 on Outposts, you can access and operate your buckets and control plane resources through S3 on Outposts APIs over IPv6 networks.

> **Note**
>
> S3 on Outposts object actions (such as `PutObject` or `GetObject`) aren't supported over IPv6 networks.

There are no additional charges for accessing S3 on Outposts over IPv6 networks. For more information about S3 on Outposts, see S3 on Outposts pricing.

**Topics**

- Getting started with IPv6
- Using dual-stack endpoints to make requests over an IPv6 network
- Using IPv6 addresses in IAM policies
- Testing IP address compatibility
- Using IPv6 with AWS PrivateLink
- Using S3 on Outposts dual-stack endpoints

### Getting started with IPv6

To make a request to an S3 on Outposts bucket over IPv6, you must use a dual-stack endpoint. The next section describes how to make requests over IPv6 by using dual-stack endpoints.

The following are important considerations before trying to access an S3 on Outposts bucket over IPv6:

- The client and the network accessing the bucket must be enabled to use IPv6.

- Both virtual hosted-style and path style requests are supported for IPv6 access. For more information, see Using S3 on Outposts dual-stack endpoints.
- If you use source IP address filtering in your AWS Identity and Access Management (IAM) user or S3 on Outposts bucket policies, you must update the policies to include IPv6 address ranges.

> **Note**
>
> This requirement only applies to S3 on Outposts bucket operations and control plane resources across IPv6 networks. Amazon S3 on Outposts object actions aren't supported across IPv6 networks.

- When using IPv6, server access log files output IP addresses in an IPv6 format. You must update existing tools, scripts, and software that you use to parse S3 on Outposts log files, so that they can parse the IPv6 formatted remote IP addresses. The updated tools, scripts, and software will then correctly parse the IPv6 formatted remote IP addresses.

## Using dual-stack endpoints to make requests over an IPv6 network

To make requests with S3 on Outposts API calls over IPv6, you can use dual-stack endpoints via AWS CLI or AWS SDK. The Amazon S3 control API operations and S3 on Outposts API operations work the same way whether you're accessing S3 on Outposts over an IPv6 protocol or IPv4 protocol. However, be aware that S3 on Outposts object actions (such as `PutObject` or `GetObject`) aren't supported over IPv6 networks.

When using the AWS Command Line Interface (AWS CLI) and AWS SDKs, you can use a parameter or flag to change to a dual-stack endpoint. You can also specify the dual-stack endpoint directly as an override of the S3 on Outposts endpoint in the configuration file.

You can use a dual-stack endpoint to access an S3 on Outposts bucket over IPv6 from any of the following:

- The AWS CLI, see Using dual-stack endpoints from the AWS CLI.
- The AWS SDKs, see Using S3 on Outposts dual-stack endpoints from the AWS SDKs.

## Using IPv6 addresses in IAM policies

Before trying to access an S3 on Outposts bucket using an IPv6 protocol, make sure that IAM users or S3 on Outposts bucket policies used for IP address filtering are updated to include IPv6 address

ranges. If IP address filtering policies aren't updated to handle IPv6 addresses, you can lose access to an S3 on Outposts bucket while trying to use the IPv6 protocol.

IAM policies that filter IP addresses use IP address condition operators. The following S3 on Outposts bucket policy identifies the 54.240.143.* IP range of allowed IPv4 addresses by using IP address condition operators. Any IP addresses outside of this range will be denied access to the S3 on Outposts bucket (DOC-EXAMPLE-BUCKET). Since all IPv6 addresses are outside of the allowed range, this policy prevents IPv6 addresses from being able to access DOC-EXAMPLE-BUCKET.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "IPAllow",
      "Effect": "Allow",
      "Principal": "*",
      "Action": "s3outposts:*",
      "Resource": "arn:aws:s3-outposts:region:111122223333:outpost/OUTPOSTS-ID/
bucket/DOC-EXAMPLE-BUCKET/*",
      "Condition": {
         "IpAddress": {"aws:SourceIp": "54.240.143.0/24"}
      }
    }
  ]
}
```

You can modify the S3 on Outposts bucket policy's Condition element to allow both IPv4 (54.240.143.0/24) and IPv6 (2001:DB8:1234:5678::/64) address ranges as shown in the following example. You can use the same type of Condition block shown in the example to update both your IAM user and bucket policies.

```
       "Condition": {
         "IpAddress": {
            "aws:SourceIp": [
              "54.240.143.0/24",
               "2001:DB8:1234:5678::/64"
             ]
          }
        }
```

Before using IPv6 you must update all relevant IAM user and bucket policies that use IP address filtering to allow IPv6 address ranges. We recommend that you update your IAM policies with your organization's IPv6 address ranges in addition to your existing IPv4 address ranges. For an example of a bucket policy that allows access over both IPv6 and IPv4, see Restrict access to specific IP addresses.

You can review your IAM user policies using the IAM console at https://console.aws.amazon.com/iam/. For more information about IAM, see the IAM User Guide. For information about editing S3 on Outposts bucket policies, see Adding or editing a bucket policy for an Amazon S3 on Outposts bucket.

### Testing IP address compatibility

If you're using a Linux or Unix instance, or macOS X platform, you can test your access to a dual-stack endpoint over IPv6. For example, to test the connection to Amazon S3 on Outposts endpoints over IPv6, use the `dig` command:

```
dig s3-outposts.us-west-2.api.aws AAAA +short
```

If your dual-stack endpoint over an IPv6 network is properly set up, the `dig` command returns the connected IPv6 addresses. For example:

```
dig s3-outposts.us-west-2.api.aws AAAA +short

2600:1f14:2588:4800:b3a9:1460:159f:ebce

2600:1f14:2588:4802:6df6:c1fd:ef8a:fc76

2600:1f14:2588:4801:d802:8ccf:4e04:817
```

### Using IPv6 with AWS PrivateLink

S3 on Outposts supports the IPv6 protocol for AWS PrivateLink services and endpoints. With AWS PrivateLink support for the IPv6 protocol, you can connect to service endpoints within your VPC over IPv6 networks, from either on-premises or other private connections. The IPv6 support for AWS PrivateLink for S3 on Outposts also allows you to integrate AWS PrivateLink with dual-stack endpoints. For steps on how to enable IPv6 for AWS PrivateLink, see Expedite your IPv6 adoption with AWS PrivateLink services and endpoints.

> **Note**
>
> To update the supported IP address type from IPv4 to IPv6, see Modify the supported IP address type in the *AWS PrivateLink User Guide*.

### Using IPv6 with AWS PrivateLink

If you're using AWS PrivateLink with IPv6, you must create an IPv6 or dual-stack VPC interface endpoint. For general steps on how to create a VPC endpoint using the AWS Management Console, see Access an AWS service using an interface VPC endpoint in the *AWS PrivateLink User Guide*.

AWS Management Console

Use the following procedure to create an interface VPC endpoint that connects to S3 on Outposts.

1. Sign in to the AWS Management Console and open the VPC console at https://console.aws.amazon.com/vpc/.
2. In the navigation pane, choose **Endpoints**.
3. Choose **Create endpoint**.
4. For **Service category**, choose **AWS services**.
5. For **Service name**, choose the S3 on Outposts service (**com.amazonaws.us-east-1.s3-outposts**).
6. For VPC, choose the VPC from which you'll access S3 on Outposts.
7. For **Subnets**, choose one subnet per Availability Zone from which you'll access S3 on Outposts. You can't select multiple subnets from the same Availability Zone. For each subnet that you select, a new endpoint network interface is created. By default, IP addresses from the subnet IP address ranges are assigned to the endpoint network interfaces. To designate an IP address for an endpoint network interface, choose **Designate IP addresses** and enter an IPv6 address from the subnet address range.
8. For **IP address type**, choose **Dualstack**. Assign both IPv4 and IPv6 addresses to your endpoint network interfaces. This option is supported only if all selected subnets have both IPv4 and IPv6 address ranges.
9. For **Security groups**, choose the security groups to associate with the endpoint network interfaces for the VPC endpoint. By default, the default security group is associated with the VPC.

10. For **Policy**, choose **Full access** to allow all operations by all principals on all resources over the VPC endpoint. Otherwise, choose **Custom** to attach a VPC endpoint policy that controls the permissions that principals have toperform actions on resources over the VPC endpoint. This option is available only if the service supports VPC endpoint policies. For more information, see Endpoint policies.
11. (Optional) To add a tag, choose **Add new tag** and enter the tag key and the tag value.
12. Choose **Create endpoint**.

#### Example – S3 on Outposts bucket policy

To allow S3 on Outposts to interact with your VPC endpoints, you can then update your S3 on Outposts policy like this:

```
{
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "s3-outposts:*",
            "Resource": "*",
            "Principal": "*"
        }
    ]
}
```

AWS CLI

> **Note**
>
> To enable the IPv6 network on your VPC endpoint, you must have `IPv6` set for the `SupportedIpAddressType` filter for S3 on Outposts.

The following example uses the `create-vpc-endpoint` command to create a new dual-stack interface endpoint.

```
aws ec2 create-vpc-endpoint \
--vpc-id vpc-12345678 \
--vpc-endpoint-type Interface \
--service-name com.amazonaws.us-east-1.s3-outposts \
--subnet-id subnet-12345678 \
```

```
--security-group-id sg-12345678 \
--ip-address-type dualstack \
--dns-options "DnsRecordIpType=dualstack"
```

Depending on the AWS PrivateLink service configuration, newly created endpoint connections might need to be accepted by the VPC endpoint service provider before they can be used. For more information, see Accept and reject endpoint connection requests in the *AWS PrivateLink User Guide*.

The following example uses the `modify-vpc-endpoint` command to update the IPv-only VPC endpoint to a dual-stack endpoint. The dual-stack endpoint allows access to both the IPv4 and IPv6 networks.

```
aws ec2 modify-vpc-endpoint \
--vpc-endpoint-id vpce-12345678 \
--add-subnet-ids subnet-12345678 \
--remove-subnet-ids subnet-12345678 \
--ip-address-type dualstack \
--dns-options "DnsRecordIpType=dualstack"
```

For more information about how to enable the IPv6 network for AWS PrivateLink, see Expedite your IPv6 adoption with AWS PrivateLink services and endpoints.

## Using S3 on Outposts dual-stack endpoints

S3 on Outposts dual-stack endpoints support requests to S3 on Outposts buckets over IPv6 and IPv4. This section describes how to use S3 on Outposts dual-stack endpoints.

**Topics**

- S3 on Outposts dual-stack endpoints
- Using dual-stack endpoints from the AWS CLI
- Using S3 on Outposts dual-stack endpoints from the AWS SDKs

### S3 on Outposts dual-stack endpoints

When you make a request to a dual-stack endpoint, the S3 on Outposts bucket URL resolves to an IPv6 or an IPv4 address. For more information about accessing an S3 on Outposts bucket over IPv6, see Making requests to S3 on Outposts over IPv6.

To access an S3 on Outposts bucket through a dual-stack endpoint, use a path-style endpoint name. S3 on Outposts supports only Regional dual-stack endpoint names, which means that you must specify the Region as part of the name.

For a dual-stack path-style FIPs endpoint, use the following naming convention:

```
s3-outposts-fips.region.api.aws
```

For dual-stack non-FIPS endpoint, use the following naming convention:

```
s3-outposts.region.api.aws
```

> **Note**
>
> Virtual hosted-style endpoint names aren't supported in S3 on Outposts.

### Using dual-stack endpoints from the AWS CLI

This section provides examples of AWS CLI commands used to make requests to a dual-stack endpoint. For instructions on setting up the AWS CLI, see Getting started by using the AWS CLI and SDK for Java.

You set the configuration value `use_dualstack_endpoint` to `true` in a profile in your AWS Config file to direct all Amazon S3 requests made by the `s3` and `s3api` AWS CLI commands to the dual-stack endpoint for the specified Region. You specify the Region in the configuration file or in a command using the `--region` option.

When using dual-stack endpoints with the AWS CLI, only `path` addressing style is supported. The addressing style, set in the configuration file, determines whether the bucket name is in the hostname or in the URL. For more information, see s3outposts in the *AWS CLI User Guide*.

To use a dual-stack endpoint via the AWS CLI, use the `--endpoint-url` parameter with the `http://s3.dualstack.region.amazonaws.com` or `https://s3-outposts-fips.region.api.aws` endpoint for any `s3control` or `s3outposts` commands.

For example:

```
$  aws s3control list-regional-buckets --endpoint-url https://s3-
outposts.region.api.aws
```

### Using S3 on Outposts dual-stack endpoints from the AWS SDKs

This section provides examples of how to access a dual-stack endpoint by using the AWS SDKs.

### AWS SDK for Java 2.x dual-stack endpoint example

The following examples show how to use the `S3ControlClient` and `S3OutpostsClient` classes to enable dual-stack endpoints when creating an S3 on Outposts client using the AWS SDK for Java 2.x. For instructions on creating and testing a working Java example for Amazon S3 on Outposts, see Getting started by using the AWS CLI and SDK for Java.

### Example – Create an `S3ControlClient` class with dual-stack endpoints enabled

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.s3control.S3ControlClient;
import software.amazon.awssdk.services.s3control.model.ListRegionalBucketsRequest;
import software.amazon.awssdk.services.s3control.model.ListRegionalBucketsResponse;
import software.amazon.awssdk.services.s3control.model.S3ControlException;

public class DualStackEndpointsExample1 {

    public static void main(String[] args) {
        Region clientRegion = Region.of("us-east-1");
        String accountId = "111122223333";
        String navyId = "9876543210";

        try {
            // Create an S3ControlClient with dual-stack endpoints enabled.
            S3ControlClient s3ControlClient = S3ControlClient.builder()
                                                             .region(clientRegion)
                                                             .dualstackEnabled(true)
                                                             .build();
            ListRegionalBucketsRequest listRegionalBucketsRequest =
 ListRegionalBucketsRequest.builder()

       .accountId(accountId)

       .outpostId(navyId)

       .build();
```

```
            ListRegionalBucketsResponse listBuckets =
 s3ControlClient.listRegionalBuckets(listRegionalBucketsRequest);
            System.out.printf("ListRegionalBuckets Response: %s%n",
 listBuckets.toString());
        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 on Outposts
 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        }
        catch (S3ControlException e) {
            // Unknown exceptions will be thrown as an instance of this type.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 on Outposts couldn't be contacted for a response, or the
 client
            // couldn't parse the response from Amazon S3 on Outposts.
            e.printStackTrace();
        }
    }
}
```

### Example – Create an `S3OutpostsClient` with dual-stack endpoints enabled

```
import com.amazonaws.AmazonServiceException;
import com.amazonaws.SdkClientException;
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.s3outposts.S3OutpostsClient;
import software.amazon.awssdk.services.s3outposts.model.ListEndpointsRequest;
import software.amazon.awssdk.services.s3outposts.model.ListEndpointsResponse;
import software.amazon.awssdk.services.s3outposts.model.S3OutpostsException;

public class DualStackEndpointsExample2 {

    public static void main(String[] args) {
        Region clientRegion = Region.of("us-east-1");

        try {
            // Create an S3OutpostsClient with dual-stack endpoints enabled.
            S3OutpostsClient s3OutpostsClient = S3OutpostsClient.builder()
                                                                .region(clientRegion)
```

```
                                                                .dualstackEnabled(true)
                                                                .build();
            ListEndpointsRequest listEndpointsRequest =
 ListEndpointsRequest.builder().build();

            ListEndpointsResponse listEndpoints =
 s3OutpostsClient.listEndpoints(listEndpointsRequest);
            System.out.printf("ListEndpoints Response: %s%n",
 listEndpoints.toString());
        } catch (AmazonServiceException e) {
            // The call was transmitted successfully, but Amazon S3 on Outposts
 couldn't process
            // it, so it returned an error response.
            e.printStackTrace();
        }
        catch (S3OutpostsException e) {
            // Unknown exceptions will be thrown as an instance of this type.
            e.printStackTrace();
        } catch (SdkClientException e) {
            // Amazon S3 on Outposts couldn't be contacted for a response, or the
 client
            // couldn't parse the response from Amazon S3 on Outposts.
            e.printStackTrace();
        }
    }
}
```

If you're using the AWS SDK for Java 2.x on Windows, you might have to set the following Java virtual machine (JVM) property:

```
java.net.preferIPv6Addresses=true
```

# Code examples for Amazon S3 using AWS SDKs

The following code examples show how to use Amazon S3 with an AWS software development kit (SDK).

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

*Cross-service examples* are sample applications that work across multiple AWS services.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

**Get started**

## Hello Amazon S3

The following code examples show how to get started using Amazon S3.

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Code for the CMakeLists.txt CMake file.

```
# Set the minimum required version of CMake for this project.
cmake_minimum_required(VERSION 3.13)

# Set the AWS service components used by this project.
set(SERVICE_COMPONENTS s3)
```

```
# Set this project's name.
project("hello_s3")

# Set the C++ standard to use to build this target.
# At least C++ 11 is required for the AWS SDK for C++.
set(CMAKE_CXX_STANDARD 11)

# Use the MSVC variable to determine if this is a Windows build.
set(WINDOWS_BUILD ${MSVC})

if (WINDOWS_BUILD) # Set the location where CMake can find the installed
 libraries for the AWS SDK.
    string(REPLACE ";" "/aws-cpp-sdk-all;" SYSTEM_MODULE_PATH
 "${CMAKE_SYSTEM_PREFIX_PATH}/aws-cpp-sdk-all")
    list(APPEND CMAKE_PREFIX_PATH ${SYSTEM_MODULE_PATH})
endif ()

# Find the AWS SDK for C++ package.
find_package(AWSSDK REQUIRED COMPONENTS ${SERVICE_COMPONENTS})

if (WINDOWS_BUILD AND AWSSDK_INSTALL_AS_SHARED_LIBS)

- Save EXIF and other image information using an AWS SDK
- Transform data for your application with S3 Object Lambda

## Actions for Amazon S3 using AWS SDKs

The following code examples demonstrate how to perform individual Amazon S3 actions with AWS SDKs. These excerpts call the Amazon S3 API and are code excerpts from larger programs that must be run in context. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

The following examples include only the most commonly used actions. For a complete list, see the Amazon Simple Storage Service (Amazon S3) API Reference.

**Examples**

- Use AbortMultipartUpload with an AWS SDK or CLI
- Use AbortMultipartUploads with an AWS SDK or CLI
- Use CompleteMultipartUpload with an AWS SDK or CLI
- Use CopyObject with an AWS SDK or CLI
- Use CreateBucket with an AWS SDK or CLI
- Use CreateMultiRegionAccessPoint with an AWS SDK or CLI
- Use CreateMultipartUpload with an AWS SDK or CLI
- Use DeleteBucket with an AWS SDK or CLI
- Use DeleteBucketAnalyticsConfiguration with an AWS SDK or CLI
- Use DeleteBucketCors with an AWS SDK or CLI
- Use DeleteBucketEncryption with an AWS SDK or CLI
- Use DeleteBucketInventoryConfiguration with an AWS SDK or CLI
- Use DeleteBucketLifecycle with an AWS SDK or CLI

- Use DeleteBucketMetricsConfiguration with an AWS SDK or CLI
- Use DeleteBucketPolicy with an AWS SDK or CLI
- Use DeleteBucketReplication with an AWS SDK or CLI
- Use DeleteBucketTagging with an AWS SDK or CLI
- Use DeleteBucketWebsite with an AWS SDK or CLI
- Use DeleteObject with an AWS SDK or CLI
- Use DeleteObjectTagging with an AWS SDK or CLI
- Use DeleteObjects with an AWS SDK or CLI
- Use DeletePublicAccessBlock with an AWS SDK or CLI
- Use GetBucketAccelerateConfiguration with an AWS SDK or CLI
- Use GetBucketAcl with an AWS SDK or CLI
- Use GetBucketAnalyticsConfiguration with an AWS SDK or CLI
- Use GetBucketCors with an AWS SDK or CLI
- Use GetBucketEncryption with an AWS SDK or CLI
- Use GetBucketInventoryConfiguration with an AWS SDK or CLI
- Use GetBucketLifecycleConfiguration with an AWS SDK or CLI
- Use GetBucketLocation with an AWS SDK or CLI
- Use GetBucketLogging with an AWS SDK or CLI
- Use GetBucketMetricsConfiguration with an AWS SDK or CLI
- Use GetBucketNotification with an AWS SDK or CLI
- Use GetBucketPolicy with an AWS SDK or CLI
- Use GetBucketPolicyStatus with an AWS SDK or CLI
- Use GetBucketReplication with an AWS SDK or CLI
- Use GetBucketRequestPayment with an AWS SDK or CLI
- Use GetBucketTagging with an AWS SDK or CLI
- Use GetBucketVersioning with an AWS SDK or CLI
- Use GetBucketWebsite with an AWS SDK or CLI
- Use GetObject with an AWS SDK or CLI
- Use GetObjectAcl with an AWS SDK or CLI
- Use GetObjectAttributes with an AWS SDK or CLI

- Use GetObjectLegalHold with an AWS SDK or CLI
- Use GetObjectLockConfiguration with an AWS SDK or CLI
- Use GetObjectRetention with an AWS SDK or CLI
- Use GetObjectTagging with an AWS SDK or CLI
- Use GetPublicAccessBlock with an AWS SDK or CLI
- Use HeadBucket with an AWS SDK or CLI
- Use HeadObject with an AWS SDK or CLI
- Use ListBucketAnalyticsConfigurations with an AWS SDK or CLI
- Use ListBucketInventoryConfigurations with an AWS SDK or CLI
- Use ListBuckets with an AWS SDK or CLI
- Use ListMultipartUploads with an AWS SDK or CLI
- Use ListObjectVersions with an AWS SDK or CLI
- Use ListObjects with an AWS SDK or CLI
- Use ListObjectsV2 with an AWS SDK or CLI
- Use PutBucketAccelerateConfiguration with an AWS SDK or CLI
- Use PutBucketAcl with an AWS SDK or CLI
- Use PutBucketCors with an AWS SDK or CLI
- Use PutBucketEncryption with an AWS SDK or CLI
- Use PutBucketLifecycleConfiguration with an AWS SDK or CLI
- Use PutBucketLogging with an AWS SDK or CLI
- Use PutBucketNotification with an AWS SDK or CLI
- Use PutBucketNotificationConfiguration with an AWS SDK or CLI
- Use PutBucketPolicy with an AWS SDK or CLI
- Use PutBucketReplication with an AWS SDK or CLI
- Use PutBucketRequestPayment with an AWS SDK or CLI
- Use PutBucketTagging with an AWS SDK or CLI
- Use PutBucketVersioning with an AWS SDK or CLI
- Use PutBucketWebsite with an AWS SDK or CLI
- Use PutObject with an AWS SDK or CLI
- Use PutObjectAcl with an AWS SDK or CLI

- Use PutObjectLegalHold with an AWS SDK or CLI
- Use PutObjectLockConfiguration with an AWS SDK or CLI
- Use PutObjectRetention with an AWS SDK or CLI
- Use RestoreObject with an AWS SDK or CLI
- Use SelectObjectContent with an AWS SDK or CLI
- Use UploadPart with an AWS SDK or CLI

## Use `AbortMultipartUpload` with an AWS SDK or CLI

The following code examples show how to use `AbortMultipartUpload`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Delete incomplete multipart uploads
- Work with Amazon S3 object integrity

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
//! Abort a multipart upload to an S3 bucket.
/*!
    \param bucket: The name of the S3 bucket where the object will be uploaded.
    \param key: The unique identifier (key) for the object within the S3 bucket.
    \param uploadID: An upload ID string.
    \param client: The S3 client instance used to perform the upload operation.
    \return bool: Function succeeded.
*/

bool AwsDoc::S3::abortMultipartUpload(const Aws::String &bucket,
                                      const Aws::String &key,
```

```
                                    const Aws::String &uploadID,
                                    const Aws::S3::S3Client &client) {
    Aws::S3::Model::AbortMultipartUploadRequest request;
    request.SetBucket(bucket);
    request.SetKey(key);
    request.SetUploadId(uploadID);

    Aws::S3::Model::AbortMultipartUploadOutcome outcome =
            client.AbortMultipartUpload(request);

    if (outcome.IsSuccess()) {
        std::cout << "Multipart upload aborted." << std::endl;
    } else {
        std::cerr << "Error aborting multipart upload: " <<
 outcome.GetError().GetMessage() << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see AbortMultipartUpload in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

**To abort the specified multipart upload**

The following `abort-multipart-upload` command aborts a multipart upload for the key `multipart/01` in the bucket `my-bucket`.

```
aws s3api abort-multipart-upload \
    --bucket my-bucket \
    --key multipart/01 \
    --upload-
id dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

- For API details, see AbortMultipartUpload in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command aborts multipart uploads created earlier than 5 days ago.**

```
Remove-S3MultipartUpload -BucketName test-files -DaysBefore 5
```

**Example 2: This command aborts multipart uploads created earlier than January 2nd, 2014.**

```
Remove-S3MultipartUpload -BucketName test-files -InitiatedDate "Thursday, January
 02, 2014"
```

**Example 3: This command aborts multipart uploads created earlier than January 2nd, 2014, 10:45:37.**

```
Remove-S3MultipartUpload -BucketName test-files -InitiatedDate "2014/01/02
 10:45:37"
```

- For API details, see AbortMultipartUpload in *AWS Tools for PowerShell Cmdlet Reference*.

## Use `AbortMultipartUploads` with an AWS SDK or CLI

The following code example shows how to use `AbortMultipartUploads`.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    using System;
    using System.Threading.Tasks;
    using Amazon.S3;
    using Amazon.S3.Transfer;

    /// <summary>
    /// This example shows how to use the Amazon Simple Storage Service
    /// (Amazon S3) to stop a multi-part upload process using the Amazon S3
    /// TransferUtility.
    /// </summary>
    public class AbortMPU
    {
        public static async Task Main()
        {
            string bucketName = "doc-example-bucket";

            // If the AWS Region defined for your default user is different
            // from the Region where your Amazon S3 bucket is located,
            // pass the Region name to the S3 client object's constructor.
            // For example: RegionEndpoint.USWest2.
            IAmazonS3 client = new AmazonS3Client();

            await AbortMPUAsync(client, bucketName);
        }

        /// <summary>
        /// Cancels the multi-part copy process.
        /// </summary>
        /// <param name="client">The initialized client object used to create
        /// the TransferUtility object.</param>
        /// <param name="bucketName">The name of the S3 bucket where the
        /// multi-part copy operation is in progress.</param>
        public static async Task AbortMPUAsync(IAmazonS3 client, string
bucketName)
        {
            try
            {
                var transferUtility = new TransferUtility(client);

                // Cancel all in-progress uploads initiated before the specified
date.
                await transferUtility.AbortMultipartUploadsAsync(
                    bucketName, DateTime.Now.AddDays(-7));
```

```
            }
            catch (AmazonS3Exception e)
            {
                Console.WriteLine($"Error: {e.Message}");
            }
        }
    }
```

- For API details, see AbortMultipartUploads in *AWS SDK for .NET API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `CompleteMultipartUpload` with an AWS SDK or CLI

The following code examples show how to use `CompleteMultipartUpload`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Perform a multipart copy
- Perform a multipart upload
- Use checksums
- Work with Amazon S3 object integrity

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
//! Complete a multipart upload to an S3 bucket.
```

```
/*!
    \param bucket: The name of the S3 bucket where the object will be uploaded.
    \param key: The unique identifier (key) for the object within the S3 bucket.
    \param uploadID: An upload ID string.
    \param parts: A vector of CompleteParts.
    \param client: The S3 client instance used to perform the upload operation.
    \return CompleteMultipartUploadOutcome: The request outcome.
*/
Aws::S3::Model::CompleteMultipartUploadOutcome
 AwsDoc::S3::completeMultipartUpload(const Aws::String &bucket,

  const Aws::String &key,

  const Aws::String &uploadID,

  const Aws::Vector<Aws::S3::Model::CompletedPart> &parts,

  const Aws::S3::S3Client &client) {
    Aws::S3::Model::CompletedMultipartUpload completedMultipartUpload;
    completedMultipartUpload.SetParts(parts);

    Aws::S3::Model::CompleteMultipartUploadRequest request;
    request.SetBucket(bucket);
    request.SetKey(key);
    request.SetUploadId(uploadID);
    request.SetMultipartUpload(completedMultipartUpload);

    Aws::S3::Model::CompleteMultipartUploadOutcome outcome =
            client.CompleteMultipartUpload(request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Error completing multipart upload: " <<
 outcome.GetError().GetMessage() << std::endl;
    }
    return outcome;
}
```

- For API details, see CompleteMultipartUpload in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The following command completes a multipart upload for the key `multipart/01` in the bucket `my-bucket`:

```
aws s3api complete-multipart-upload --multipart-upload file://
mpustruct --bucket my-bucket --key 'multipart/01' --upload-
id dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

The multipart upload option in the above command takes a JSON structure that describes the parts of the multipart upload that should be reassembled into the complete file. In this example, the `file://` prefix is used to load the JSON structure from a file in the local folder named `mpustruct`.

mpustruct:

```
{
  "Parts": [
    {
      "ETag": "e868e0f4719e394144ef36531ee6824c",
      "PartNumber": 1
    },
    {
      "ETag": "6bb2b12753d66fe86da4998aa33fffb0",
      "PartNumber": 2
    },
    {
      "ETag": "d0a0112e841abec9c9ec83406f0159c8",
      "PartNumber": 3
    }
  ]
}
```

The ETag value for each part is upload is output each time you upload a part using the `upload-part` command and can also be retrieved by calling `list-parts` or calculated by taking the MD5 checksum of each part.

Output:

```
{
    "ETag": "\"3944a9f7a4faab7f78788ff6210f63f0-3\"",
    "Bucket": "my-bucket",
    "Location": "https://my-bucket.s3.amazonaws.com/multipart%2F01",
    "Key": "multipart/01"
}
```

- For API details, see CompleteMultipartUpload in *AWS CLI Command Reference*.

Rust

**SDK for Rust**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    let _complete_multipart_upload_res = client
        .complete_multipart_upload()
        .bucket(&bucket_name)
        .key(&key)
        .multipart_upload(completed_multipart_upload)
        .upload_id(upload_id)
        .send()
        .await
        .unwrap();
```

- For API details, see CompleteMultipartUpload in *AWS SDK for Rust API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

# Use `CopyObject` with an AWS SDK or CLI

The following code examples show how to use `CopyObject`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Get started with buckets and objects
- Get started with encryption

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    using System;
    using System.Threading.Tasks;
    using Amazon.S3;
    using Amazon.S3.Model;

    public class CopyObject
    {
        public static async Task Main()
        {
            // Specify the AWS Region where your buckets are located if it is
            // different from the AWS Region of the default user.
            IAmazonS3 s3Client = new AmazonS3Client();

            // Remember to change these values to refer to your Amazon S3
objects.
            string sourceBucketName = "doc-example-bucket1";
            string destinationBucketName = "doc-example-bucket2";
            string sourceObjectKey = "testfile.txt";
            string destinationObjectKey = "testfilecopy.txt";
```

```
            Console.WriteLine($"Copying {sourceObjectKey} from {sourceBucketName}
 to ");
            Console.WriteLine($"{destinationBucketName} as
 {destinationObjectKey}");

            var response = await CopyingObjectAsync(
                s3Client,
                sourceObjectKey,
                destinationObjectKey,
                sourceBucketName,
                destinationBucketName);

            if (response.HttpStatusCode == System.Net.HttpStatusCode.OK)
            {
                Console.WriteLine("\nCopy complete.");
            }
        }

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::S3::copyObject(const Aws::String &objectKey, const Aws::String
 &fromBucket, const Aws::String &toBucket,
                             const Aws::S3::S3ClientConfiguration &clientConfig) {
    Aws::S3::S3Client client(clientConfig);
    Aws::S3::Model::CopyObjectRequest request;

    request.WithCopySource(fromBucket + "/" + objectKey)
            .WithKey(objectKey)
            .WithBucket(toBucket);

    Aws::S3::Model::CopyObjectOutcome outcome = client.CopyObject(request);
    if (!outcome.IsSuccess()) {
        const Aws::S3::S3Error &err = outcome.GetError();
        std::cerr << "Error: copyObject: " <<
                  err.GetExceptionName() << ": " << err.GetMessage() <<
 std::endl;

    } else {
        std::cout << "Successfully copied " << objectKey << " from " <<
 fromBucket <<
                  " to " << toBucket << "." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see CopyObject in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The following command copies an object from `bucket-1` to `bucket-2`:

```
aws s3api copy-object --copy-source bucket-1/test.txt --key test.txt --
bucket bucket-2
```

Output:

```
{
    "CopyObjectResult": {
```

```
        "LastModified": "2015-11-10T01:07:25.000Z",
        "ETag": "\"589c8b79c230a6ecd5a7e1d040a9a030\""
    },
    "VersionId": "YdnYvTCVDqRRFA.NFJjy36p0hxifMlkA"
}
```

- For API details, see CopyObject in *AWS CLI Command Reference*.

Go

**SDK for Go V2**

> **Note**
>

PHP

### SDK for PHP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Simple copy of an object.

```
        $s3client = new Aws\S3\S3Client(['region' => 'us-west-2']);

        try {
            $folder = "copied-folder";
            $this->s3client->copyObject([
                'Bucket' => $this->bucketName,
                'CopySource' => "$this->bucketName/$fileName",
                'Key' => "$folder/$fileName-copy",
            ]);
            echo "Copied $fileName to $folder/$fileName-copy.\n";
        } catch (Exception $exception) {
            echo "Failed to copy $fileName with error: " . $exception-
>getMessage();
            exit("Please fix error with object copying before continuing.");
        }
```

- For API details, see CopyObject in *AWS SDK for PHP API Reference*.

PowerShell

### Tools for PowerShell

**Example 1: This command copies the object "sample.txt" from bucket "test-files" to the same bucket but with a new key of "sample-copy.txt".**

```
Copy-S3Object -BucketName test-files -Key sample.txt -DestinationKey sample-
copy.txt
```

**Example 2: This command copies the object "sample.txt" from bucket "test-files" to the bucket "backup-files" with a key of "sample-copy.txt".**

```
Copy-S3Object -BucketName test-files -Key sample.txt -DestinationKey sample-
copy.txt -DestinationBucket backup-files
```

**Example 3: This command downloads the object "sample.txt" from bucket "test-files" to a local file with name "local-sample.txt".**

```
Copy-S3Object -BucketName test-files -Key sample.txt -LocalFile local-sample.txt
```

**Example 4: Downloads the single object to the specified file. The downloaded file will be found at c:\downloads\data\archive.zip**

```
Copy-S3Object -BucketName test-files -Key data/archive.zip -LocalFolder c:
\downloads
```

**Example 5: Downloads all objects that match the specified key prefix to the local folder. The relative key hierarchy will be preserved as subfolders in the overall download location.**

```
Copy-S3Object -BucketName test-files -KeyPrefix data -LocalFolder c:\downloads
```

- For API details, see CopyObject in *AWS Tools for PowerShell Cmdlet Reference*.

Python

**SDK for Python (Boto3)**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class ObjectWrapper:
    """Encapsulates S3 object actions."""
```

```
    def __init__(self, s3_object):
        """
        :param s3_object: A Boto3 Object resource. This is a high-level resource
in Boto3
                          that wraps object actions in a class-like structure.
        """
        self.object = s3_object
        self.key = self.object.key

    def copy(self, dest_object):
        """
        Copies the object to another bucket.

        :param dest_object: The destination object initialized with a bucket and
key.
                            This is a Boto3 Object resource.
        """
        try:

Ruby

### SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Copy an object.

```
require "aws-sdk-s3"

# Wraps Amazon S3 object actions.
class ObjectCopyWrapper
  attr_reader :source_object

  # @param source_object [Aws::S3::Object] An existing Amazon S3 object. This is
 used as the source object for
  #                                        copy actions.
  def initialize(source_object)
    @source_object = source_object
  end

  # Copy the source object to the specified target bucket and rename it with the
 target key.
  #
  # @param target_bucket [Aws::S3::Bucket] An existing Amazon S3 bucket where the
 object is copied.
  # @param target_object_key [String] The key to give the copy of the object.
  # @return [Aws::S3::Object, nil] The copied object when successful; otherwise,
 nil.
  def copy_object(target_bucket, target_object_key)
    @source_object.copy_to(bucket: target_bucket.name, key: target_object_key)
    target_bucket.object(target_object_key)
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't copy #{@source_object.key} to #{target_object_key}. Here's
 why: #{e.message}"
  end
end

# Example usage:
```

```
def run_demo
  source_bucket_name = "doc-example-bucket1"
  source_key = "my-source-file.txt"
  target_bucket_name = "doc-example-bucket2"
  target_key = "my-target-file.txt"

  source_bucket = Aws::S3::Bucket.new(source_bucket_name)
  wrapper = ObjectCopyWrapper.new(source_bucket.object(source_key))
  target_bucket = Aws::S3::Bucket.new(target_bucket_name)
  target_object = wrapper.copy_object(target_bucket, target_key)
  return unless target_object

  puts "Copied #{source_key} from #{source_bucket_name} to
 #{target_object.bucket_name}:#{target_object.key}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Copy an object and add server-side encryption to the destination object.

```
require "aws-sdk-s3"

# Wraps Amazon S3 object actions.
class ObjectCopyEncryptWrapper
  attr_reader :source_object

  # @param source_object [Aws::S3::Object] An existing Amazon S3 object. This is
 used as the source object for
  #                                        copy actions.
  def initialize(source_object)
    @source_object = source_object
  end

  # Copy the source object to the specified target bucket, rename it with the
 target key, and encrypt it.
  #
  # @param target_bucket [Aws::S3::Bucket] An existing Amazon S3 bucket where the
 object is copied.
  # @param target_object_key [String] The key to give the copy of the object.
  # @return [Aws::S3::Object, nil] The copied object when successful; otherwise,
 nil.
  def copy_object(target_bucket, target_object_key, encryption)
```

```
    @source_object.copy_to(bucket: target_bucket.name, key: target_object_key,
 server_side_encryption: encryption)
    target_bucket.object(target_object_key)
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't copy #{@source_object.key} to #{target_object_key}. Here's
 why: #{e.message}"
  end
end

# Example usage:
def run_demo
  source_bucket_name = "doc-example-bucket1"
  source_key = "my-source-file.txt"
  target_bucket_name = "doc-example-bucket2"
  target_key = "my-target-file.txt"
  target_encryption = "AES256"

  source_bucket = Aws::S3::Bucket.new(source_bucket_name)
  wrapper = ObjectCopyEncryptWrapper.new(source_bucket.object(source_key))
  target_bucket = Aws::S3::Bucket.new(target_bucket_name)
  target_object = wrapper.copy_object(target_bucket, target_key,
 target_encryption)
  return unless target_object

  puts "Copied #{source_key} from #{source_bucket_name} to
 #{target_object.bucket_name}:#{target_object.key} and "\
       "encrypted the target with #{target_object.server_side_encryption}
 encryption."
end

run_demo if $PROGRAM_NAME == __FILE__
```

## Use `CreateBucket` with an AWS SDK or CLI

The following code examples show how to use `CreateBucket`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Get started with buckets and objects
- Work with versioned objects

.NET

### AWS SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        /// <summary>
        /// Shows how to create a new Amazon S3 bucket.
        /// </summary>
        /// <param name="client">An initialized Amazon S3 client object.</param>
        /// <param name="bucketName">The name of the bucket to create.</param>
        /// <returns>A boolean value representing the success or failure of
        /// the bucket creation process.</returns>
        public static async Task<bool> CreateBucketAsync(IAmazonS3 client, string
bucketName)
        {
            try
            {
                var request = new PutBucketRequest
                {
                    BucketName = bucketName,
                    UseClientRegion = true,
                };

                var response = await client.PutBucketAsync(request);
                return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
            }
            catch (AmazonS3Exception ex)

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::S3::createBucket(const Aws::String &bucketName,
                              const Aws::S3::S3ClientConfiguration &clientConfig)
 {
    Aws::S3::S3Client client(clientConfig);
    Aws::S3::Model::CreateBucketRequest request;
    request.SetBucket(bucketName);

    if (clientConfig.region != "us-east-1") {
        Aws::S3::Model::CreateBucketConfiguration createBucketConfig;
        createBucketConfig.SetLocationConstraint(

 Aws::S3::Model::BucketLocationConstraintMapper::GetBucketLocationConstraintForName(
                        clientConfig.region));
        request.SetCreateBucketConfiguration(createBucketConfig);
    }

    Aws::S3::Model::CreateBucketOutcome outcome = client.CreateBucket(request);
    if (!outcome.IsSuccess()) {
        auto err = outcome.GetError();
        std::cerr << "Error: createBucket: " <<
                  err.GetExceptionName() << ": " << err.GetMessage() <<
 std::endl;
    } else {
        std::cout << "Created bucket " << bucketName <<
                  " in the specified AWS Region." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see [CreateBucket](#) in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

**Example 1: To create a bucket**

The following `create-bucket` example creates a bucket named `my-bucket`:

```
aws s3api create-bucket \
```

```
    --bucket my-bucket \
    --region us-east-1
```

Output:

```
{
    "Location": "/my-bucket"
}
```

For more information, see Creating a bucket in the *Amazon S3 User Guide*.

**Example 2: To create a bucket with owner enforced**

The following `create-bucket` example creates a bucket named `my-bucket` that uses the bucket owner enforced setting for S3 Object Ownership.

```
aws s3api create-bucket \
    --bucket my-bucket \
    --region us-east-1 \
    --object-ownership BucketOwnerEnforced
```

Output:

```
{
    "Location": "/my-bucket"
}
```

For more information, see Controlling ownership of objects and disabling ACLs in the *Amazon S3 User Guide*.

**Example 3: To create a bucket outside of the ``us-east-1`` region**

The following `create-bucket` example creates a bucket named `my-bucket` in the `eu-west-1` region. Regions outside of `us-east-1` require the appropriate `LocationConstraint` to be specified in order to create the bucket in the desired region.

```
aws s3api create-bucket \
    --bucket my-bucket \
    --region eu-west-1 \
    --create-bucket-configuration LocationConstraint=eu-west-1
```

Output:

```
{
    "Location": "http://my-bucket.s3.amazonaws.com/"
}
```

For more information, see Creating a bucket in the *Amazon S3 User Guide*.

- For API details, see CreateBucket in *AWS CLI Command Reference*.

Go

**SDK for Go V2**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create a bucket with default configuration.

```
// BucketBasics encapsulates the Amazon Simple Storage Service (Amazon S3)
 actions
// used in the examples.
// It contains S3Client, an Amazon S3 service client that is used to perform
 bucket
// and object actions.
type BucketBasics struct {
 S3Client *s3.Client
}

// CreateBucket creates a bucket with the specified name in the specified Region.
func (basics BucketBasics) CreateBucket(name string, region string) error {
 _, err := basics.S3Client.CreateBucket(context.TODO(), &s3.CreateBucketInput{
  Bucket: aws.String(name),
  CreateBucketConfiguration: &types.CreateBucketConfiguration{
   LocationConstraint: types.BucketLocationConstraint(region),
  },
```

```
 })
 if err != nil {
  log.Printf("Couldn't create bucket %v in Region %v. Here's why: %v\n",
   name, region, err)
 }
 return err
}
```

Create a bucket with object locking and wait for it to exist.

```
// S3Actions wraps S3 service actions.
type S3Actions struct {
 S3Client  *s3.Client
 S3Manager *manager.Uploader
}

// CreateBucketWithLock creates a new S3 bucket with optional object locking
 enabled
// and waits for the bucket to exist before returning.
func (actor S3Actions) CreateBucketWithLock(ctx context.Context, bucket string,
 region string, enableObjectLock bool) (string, error) {
 input := &s3.CreateBucketInput{
  Bucket: aws.String(bucket),
  CreateBucketConfiguration: &types.CreateBucketConfiguration{
   LocationConstraint: types.BucketLocationConstraint(region),
  },
 }

 if enableObjectLock {
  input.ObjectLockEnabledForBucket = aws.Bool(true)
 }

 _, err := actor.S3Client.CreateBucket(ctx, input)
 if err != nil {
  var owned *types.BucketAlreadyOwnedByYou
  var exists *types.BucketAlreadyExists
  if errors.As(err, &owned) {
   log.Printf("You already own bucket %s.\n", bucket)
```

```
    err = owned
   } else if errors.As(err, &exists) {
    log.Printf("Bucket %s already exists.\n", bucket)
    err = exists
   }
  } else {
   err = s3.NewBucketExistsWaiter(actor.S3Client).Wait(
    ctx, &s3.HeadBucketInput{Bucket: aws.String(bucket)}, time.Minute)
   if err != nil {
    log.Printf("Failed attempt to wait for bucket %s to exist.\n", bucket)
   }
  }

  return bucket, err
}
```

- For API details, see CreateBucket in *AWS SDK for Go API Reference*.

Create the bucket.

```
import { CreateBucketCommand, S3Client } from "@aws-sdk/client-s3";

const client = new S3Client({});

export const main = async () => {
  const command = new CreateBucketCommand({
    // The name of the bucket. Bucket names are unique and have several other
 constraints.
    // See https://docs.aws.amazon.com/AmazonS3/latest/userguide/
bucketnamingrules.html
    Bucket: "bucket-name",
  });

  try {
    const { Location } = await client.send(command);
    console.log(`Bucket created with location ${Location}`);
  } catch (err) {
    console.error(err);
  }
};
```

Create a bucket.

```
        $s3client = new Aws\S3\S3Client(['region' => 'us-west-2']);

        try {
```

```
            $this->s3client->createBucket([
                'Bucket' => $this->bucketName,
                'CreateBucketConfiguration' => ['LocationConstraint' => $region],
            ]);
            echo "Created bucket named: $this->bucketName \n";
        } catch (Exception $exception) {
            echo "Failed to create bucket $this->bucketName with error: " .
 $exception->getMessage();
            exit("Please fix error with bucket creation before continuing.");
        }
```

- For API details, see CreateBucket in *AWS SDK for PHP API Reference*.

Python

**SDK for Python (Boto3)**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create a bucket with default settings.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def create(self, region_override=None):
        """
```

```
        Create an Amazon S3 bucket in the default Region for the account or in
 the
        specified Region.

        :param region_override: The Region in which to create the bucket. If this
 is
                                not specified, the Region configured in your
 shared
                                credentials is used.
        """
        if region_override is not None:
            region = region_override
        else:
            region = self.bucket.meta.client.meta.region_name
        try:
            self.bucket.create(CreateBucketConfiguration={"LocationConstraint":
 region})

            self.bucket.wait_until_exists()
            logger.info("Created bucket '%s' in region=%s", self.bucket.name,
 region)
        except ClientError as error:
            logger.exception(
                "Couldn't create bucket named '%s' in region=%s.",
                self.bucket.name,
                region,
            )
            raise error
```

Create a versioned bucket with a lifecycle configuration.

```
def create_versioned_bucket(bucket_name, prefix):
    """
    Creates an Amazon S3 bucket, enables it for versioning, and configures a
 lifecycle
    that expires noncurrent object versions after 7 days.

    Adding a lifecycle configuration to a versioned bucket is a best practice.
    It helps prevent objects in the bucket from accumulating a large number of
    noncurrent versions, which can slow down request performance.
```

```
    Usage is shown in the usage_demo_single_object function at the end of this
module.

    :param bucket_name: The name of the bucket to create.
    :param prefix: Identifies which objects are automatically expired under the
                   configured lifecycle rules.
    :return: The newly created bucket.
    """
    try:
        bucket = s3.create_bucket(
            Bucket=bucket_name,
            CreateBucketConfiguration={
                "LocationConstraint": s3.meta.client.meta.region_name
            },
        )
        logger.info("Created bucket %s.", bucket.name)
    except ClientError as error:
        if error.response["Error"]["Code"] == "BucketAlreadyOwnedByYou":
            logger.warning("Bucket %s already exists! Using it.", bucket_name)

## Use `CreateMultiRegionAccessPoint` with an AWS SDK or CLI

The following code example shows how to use `CreateMultiRegionAccessPoint`.

Kotlin

**SDK for Kotlin**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Configure the S3 control client to send request to the us-west-2 Region.

```
        suspend fun createS3ControlClient(): S3ControlClient {
            // Configure your S3ControlClient to send requests to US West
(Oregon).
            val s3Control = S3ControlClient.fromEnvironment {
                region = "us-west-2"
            }
```

```
            return s3Control
        }
```

Create the Multi-Region Access Point.

```
    suspend fun createMrap(
        s3Control: S3ControlClient,
        accountIdParam: String,
        bucketName1: String,
        bucketName2: String,
        mrapName: String,
    ): String {
        println("Creating MRAP ...")
        val createMrapResponse: CreateMultiRegionAccessPointResponse =
            s3Control.createMultiRegionAccessPoint {
                accountId = accountIdParam
                clientToken = UUID.randomUUID().toString()
                details {
                    name = mrapName
                    regions = listOf(
                        Region {
                            bucket = bucketName1
                        },
                        Region {
                            bucket = bucketName2
                        },
                    )
                }
            }
        val requestToken: String? = createMrapResponse.requestTokenArn

        // Use the request token to check for the status of the
 CreateMultiRegionAccessPoint operation.
        if (requestToken != null) {
            waitForSucceededStatus(s3Control, requestToken, accountIdParam)
            println("MRAP created")
        }

        val getMrapResponse =
            s3Control.getMultiRegionAccessPoint(
                input = GetMultiRegionAccessPointRequest {
                    accountId = accountIdParam
```

```
                    name = mrapName
                },
            )
        val mrapAlias = getMrapResponse.accessPoint?.alias
        return "arn:aws:s3::$accountIdParam:accesspoint/$mrapAlias"
    }
```

Wait for the Multi-Region Access Point to become available.

```
        suspend fun waitForSucceededStatus(
            s3Control: S3ControlClient,
            requestToken: String,
            accountIdParam: String,
            timeBetweenChecks: Duration = 1.minutes,
        ) {
            var describeResponse: DescribeMultiRegionAccessPointOperationResponse
            describeResponse = s3Control.describeMultiRegionAccessPointOperation(
                input = DescribeMultiRegionAccessPointOperationRequest {
                    accountId = accountIdParam
                    requestTokenArn = requestToken
                },
            )

            var status: String? = describeResponse.asyncOperation?.requestStatus
            while (status != "SUCCEEDED") {
                delay(timeBetweenChecks)
                describeResponse =
s3Control.describeMultiRegionAccessPointOperation(
                    input = DescribeMultiRegionAccessPointOperationRequest {
                        accountId = accountIdParam
                        requestTokenArn = requestToken
                    },
                )
                status = describeResponse.asyncOperation?.requestStatus
                println(status)
            }
        }
```

- For more information, see AWS SDK for Kotlin developer guide.
- For API details, see CreateMultiRegionAccessPoint in *AWS SDK for Kotlin API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `CreateMultipartUpload` with an AWS SDK or CLI

The following code examples show how to use `CreateMultipartUpload`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Perform a multipart copy
- Perform a multipart upload
- Use checksums
- Work with Amazon S3 object integrity

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
//! Create a multipart upload.
/*!
    \param bucket: The name of the S3 bucket where the object will be uploaded.
    \param key: The unique identifier (key) for the object within the S3 bucket.
    \param client: The S3 client instance used to perform the upload operation.
    \return Aws::String: Upload ID or empty string if failed.
*/
Aws::String
AwsDoc::S3::createMultipartUpload(const Aws::String &bucket, const Aws::String
 &key,
                                  Aws::S3::Model::ChecksumAlgorithm
 checksumAlgorithm,
                                  const Aws::S3::S3Client &client) {
    Aws::S3::Model::CreateMultipartUploadRequest request;
```

```
    request.SetBucket(bucket);
    request.SetKey(key);

    if (checksumAlgorithm != Aws::S3::Model::ChecksumAlgorithm::NOT_SET) {
        request.SetChecksumAlgorithm(checksumAlgorithm);
    }

    Aws::S3::Model::CreateMultipartUploadOutcome outcome =
            client.CreateMultipartUpload(request);

    Aws::String uploadID;
    if (outcome.IsSuccess()) {
        uploadID = outcome.GetResult().GetUploadId();
    } else {
        std::cerr << "Error creating multipart upload: " <<
 outcome.GetError().GetMessage() << std::endl;
    }

    return uploadID;
}
```

- For API details, see CreateMultipartUpload in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The following command creates a multipart upload in the bucket `my-bucket` with the key `multipart/01`:

```
aws s3api create-multipart-upload --bucket my-bucket --key 'multipart/01'
```

Output:

```
{
    "Bucket": "my-bucket",
    "UploadId":
 "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3
    "Key": "multipart/01"
}
```

The completed file will be named `01` in a folder called `multipart` in the bucket `my-bucket`. Save the upload ID, key and bucket name for use with the `upload-part` command.

- For API details, see CreateMultipartUpload in *AWS CLI Command Reference*.

Rust

**SDK for Rust**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
let multipart_upload_res: CreateMultipartUploadOutput = client
    .create_multipart_upload()
    .bucket(&bucket_name)
    .key(&key)
    .send()
    .await
    .unwrap();
```

- For API details, see CreateMultipartUpload in *AWS SDK for Rust API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `DeleteBucket` with an AWS SDK or CLI

The following code examples show how to use `DeleteBucket`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Get started with buckets and objects

.NET

### AWS SDK for .NET

```
// BucketBasics encapsulates the Amazon Simple Storage Service (Amazon S3)
 actions
// used in the examples.
// It contains S3Client, an Amazon S3 service client that is used to perform
 bucket
// and object actions.
type BucketBasics struct {
 S3Client *s3.Client
}

// DeleteBucket deletes a bucket. The bucket must be empty or an error is
 returned.
func (basics BucketBasics) DeleteBucket(bucketName string) error {
 _, err := basics.S3Client.DeleteBucket(context.TODO(), &s3.DeleteBucketInput{
  Bucket: aws.String(bucketName)})
 if err != nil {
```

```
  log.Printf("Couldn't delete bucket %v. Here's why: %v\n", bucketName, err)
 }
 return err
}
```

- For API details, see DeleteBucket in *AWS SDK for Go API Reference*.

Java

**SDK for Java 2.x**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        DeleteBucketRequest deleteBucketRequest = DeleteBucketRequest.builder()
                .bucket(bucket)
                .build();

        s3.deleteBucket(deleteBucketRequest);
        s3.close();
```

- For API details, see DeleteBucket in *AWS SDK for Java 2.x API Reference*.

JavaScript

**SDK for JavaScript (v3)**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Delete the bucket.

```
import { DeleteBucketCommand, S3Client } from "@aws-sdk/client-s3";

const client = new S3Client({});

// Delete a bucket.
export const main = async () => {
  const command = new DeleteBucketCommand({
    Bucket: "test-bucket",
  });

  try {
    const response = await client.send(command);
    console.log(response);
  } catch (err) {
    console.error(err);
  }
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see DeleteBucket in *AWS SDK for JavaScript API Reference*.

PHP

**SDK for PHP**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Delete an empty bucket.

```
        $s3client = new Aws\S3\S3Client(['region' => 'us-west-2']);

        try {
            $this->s3client->deleteBucket([
                'Bucket' => $this->bucketName,
            ]);
            echo "Deleted bucket $this->bucketName.\n";
```

```
        } catch (Exception $exception) {
            echo "Failed to delete $this->bucketName with error: " . $exception-
>getMessage();
            exit("Please fix error with bucket deletion before continuing.");
        }
```

- For API details, see DeleteBucket in *AWS SDK for PHP API Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command removes all objects and object versions from the bucket 'test-files' and then deletes the bucket. The command will prompt for confirmation before proceeding. Add the -Force switch to suppress confirmation. Note that buckets that are not empty cannot be deleted.**

```
Remove-S3Bucket -BucketName test-files -DeleteBucketContent
```

- For API details, see DeleteBucket in *AWS Tools for PowerShell Cmdlet Reference*.

Python

**SDK for Python (Boto3)**

## Use `DeleteBucketAnalyticsConfiguration` with an AWS SDK or CLI

The following code examples show how to use `DeleteBucketAnalyticsConfiguration`.

CLI

**AWS CLI**

**To delete an analytics configuration for a bucket**

The following `delete-bucket-analytics-configuration` example removes the analytics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-analytics-configuration \
    --bucket my-bucket \
    --id 1
```

This command produces no output.

- For API details, see DeleteBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: The command removes the analytics filter with name 'testfilter' in the given S3 bucket.**

```
Remove-S3BucketAnalyticsConfiguration -BucketName 's3testbucket' -AnalyticsId
 'testfilter'
```

- For API details, see DeleteBucketAnalyticsConfiguration in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `DeleteBucketCors` with an AWS SDK or CLI

The following code examples show how to use `DeleteBucketCors`.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        /// <summary>
        /// Deletes a CORS configuration from an Amazon S3 bucket.
        /// </summary>
        /// <param name="client">The initialized Amazon S3 client object used
        /// to delete the CORS configuration from the bucket.</param>
        private static async Task DeleteCORSConfigurationAsync(AmazonS3Client
client)
        {
            DeleteCORSConfigurationRequest request = new
DeleteCORSConfigurationRequest()
            {
                BucketName = BucketName,
            };
            await client.DeleteCORSConfigurationAsync(request);
        }
```

- For API details, see DeleteBucketCors in *AWS SDK for .NET API Reference*.

CLI

### AWS CLI

The following command deletes a Cross-Origin Resource Sharing configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-cors --bucket my-bucket
```

- For API details, see DeleteBucketCors in *AWS CLI Command Reference*.

Python

### SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def delete_cors(self):
        """
        Delete the CORS rules from the bucket.

        :param bucket_name: The name of the bucket to update.
        """
        try:
```

```
            self.bucket.Cors().delete()
            logger.info("Deleted CORS from bucket '%s'.", self.bucket.name)
        except ClientError:
            logger.exception("Couldn't delete CORS from bucket '%s'.",
 self.bucket.name)
            raise
```

- For API details, see DeleteBucketCors in *AWS SDK for Python (Boto3) API Reference*.

Ruby

**SDK for Ruby**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
require "aws-sdk-s3"

# Wraps Amazon S3 bucket CORS configuration.
class BucketCorsWrapper
  attr_reader :bucket_cors

  # @param bucket_cors [Aws::S3::BucketCors] A bucket CORS object configured with
 an existing bucket.
  def initialize(bucket_cors)
    @bucket_cors = bucket_cors
  end

  # Deletes the CORS configuration of a bucket.
  #
  # @return [Boolean] True if the CORS rules were deleted; otherwise, false.
  def delete_cors
    @bucket_cors.delete
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't delete CORS rules for #{@bucket_cors.bucket.name}. Here's why:
 #{e.message}"
```

```
    false
  end

end
```

- For API details, see DeleteBucketCors in *AWS SDK for Ruby API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `DeleteBucketEncryption` with an AWS SDK or CLI

The following code examples show how to use `DeleteBucketEncryption`.

CLI

### AWS CLI

#### To delete the server-side encryption configuration of a bucket

The following `delete-bucket-encryption` example deletes the server-side encryption configuration of the specified bucket.

```
aws s3api delete-bucket-encryption \
    --bucket my-bucket
```

This command produces no output.

- For API details, see DeleteBucketEncryption in *AWS CLI Command Reference*.

PowerShell

### Tools for PowerShell

#### Example 1: This disables the encryption enabled for the S3 bucket provided.

```
Remove-S3BucketEncryption -BucketName 's3casetestbucket'
```

**Output:**

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketEncryption (DeleteBucketEncryption)" on
 target "s3casetestbucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is
 "Y"): Y
```

- For API details, see DeleteBucketEncryption in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `DeleteBucketInventoryConfiguration` with an AWS SDK or CLI

The following code examples show how to use `DeleteBucketInventoryConfiguration`.

CLI

### AWS CLI

#### To delete the inventory configuration of a bucket

The following `delete-bucket-inventory-configuration` example deletes the inventory configuration with ID 1 for the specified bucket.

```
aws s3api delete-bucket-inventory-configuration \
    --bucket my-bucket \
    --id 1
```

This command produces no output.

- For API details, see DeleteBucketInventoryConfiguration in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command removes the invventory named 'testInventoryName' corresponding to the given S3 bucket.**

```
Remove-S3BucketInventoryConfiguration -BucketName 's3testbucket' -InventoryId
 'testInventoryName'
```

**Output:**

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketInventoryConfiguration
 (DeleteBucketInventoryConfiguration)" on target "s3testbucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is
 "Y"): Y
```

- For API details, see DeleteBucketInventoryConfiguration in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `DeleteBucketLifecycle` with an AWS SDK or CLI

The following code examples show how to use `DeleteBucketLifecycle`.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        /// <summary>
        /// This method removes the Lifecycle configuration from the named
        /// S3 bucket.
        /// </summary>
        /// <param name="client">The S3 client object used to call
        /// the RemoveLifecycleConfigAsync method.</param>
        /// <param name="bucketName">A string representing the name of the
        /// S3 bucket from which the configuration will be removed.</param>
        public static async Task RemoveLifecycleConfigAsync(IAmazonS3 client,
string bucketName)
        {
            var request = new DeleteLifecycleConfigurationRequest()
            {
                BucketName = bucketName,
            };
            await client.DeleteLifecycleConfigurationAsync(request);
        }
```

- For API details, see DeleteBucketLifecycle in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

The following command deletes a lifecycle configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-lifecycle --bucket my-bucket
```

- For API details, see DeleteBucketLifecycle in *AWS CLI Command Reference*.

Python

### SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def delete_lifecycle_configuration(self):
        """
        Remove the lifecycle configuration from the specified bucket.
        """
        try:
            self.bucket.LifecycleConfiguration().delete()
            logger.info(
                "Deleted lifecycle configuration for bucket '%s'.",
 self.bucket.name
            )
        except ClientError:
            logger.exception(
                "Couldn't delete lifecycle configuration for bucket '%s'.",
                self.bucket.name,
            )
            raise
```

- For API details, see DeleteBucketLifecycle in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `DeleteBucketMetricsConfiguration` with an AWS SDK or CLI

The following code examples show how to use `DeleteBucketMetricsConfiguration`.

CLI

**AWS CLI**

**To delete a metrics configuration for a bucket**

The following `delete-bucket-metrics-configuration` example removes the metrics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-metrics-configuration \
    --bucket my-bucket \
    --id 123
```

This command produces no output.

- For API details, see DeleteBucketMetricsConfiguration in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: The command removes the metrics filter with name 'testmetrics' in the given S3 bucket.**

```
Remove-S3BucketMetricsConfiguration -BucketName 's3testbucket' -MetricsId
 'testmetrics'
```

- For API details, see DeleteBucketMetricsConfiguration in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `DeleteBucketPolicy` with an AWS SDK or CLI

The following code examples show how to use `DeleteBucketPolicy`.

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::S3::deleteBucketPolicy(const Aws::String &bucketName,
                                    const Aws::S3::S3ClientConfiguration
 &clientConfig) {
    Aws::S3::S3Client client(clientConfig);

    Aws::S3::Model::DeleteBucketPolicyRequest request;
    request.SetBucket(bucketName);

    Aws::S3::Model::DeleteBucketPolicyOutcome outcome =
 client.DeleteBucketPolicy(request);

    if (!outcome.IsSuccess()) {
        const Aws::S3::S3Error &err = outcome.GetError();
        std::cerr << "Error: deleteBucketPolicy: " <<
                  err.GetExceptionName() << ": " << err.GetMessage() <<
 std::endl;
    } else {
        std::cout << "Policy was deleted from the bucket." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see DeleteBucketPolicy in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The following command deletes a bucket policy from a bucket named `my-bucket`:

```
aws s3api delete-bucket-policy --bucket my-bucket
```

- For API details, see DeleteBucketPolicy in *AWS CLI Command Reference*.

Java

**SDK for Java 2.x**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```

JavaScript

### SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Delete the bucket policy.

```
import { DeleteBucketPolicyCommand, S3Client } from "@aws-sdk/client-s3";

const client = new S3Client({});

// This will remove the policy from the bucket.
export const main = async () => {
  const command = new DeleteBucketPolicyCommand({
    Bucket: "test-bucket",
  });

  try {
    const response = await client.send(command);
    console.log(response);
  } catch (err) {
    console.error(err);
  }
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see DeleteBucketPolicy in *AWS SDK for JavaScript API Reference*.

Kotlin

### SDK for Kotlin

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
suspend fun deleteS3BucketPolicy(bucketName: String?) {
    val request =
        DeleteBucketPolicyRequest {
            bucket = bucketName
        }

    S3Client { region = "us-east-1" }.use { s3 ->
        s3.deleteBucketPolicy(request)
        println("Done!")
    }
}
```

- For API details, see DeleteBucketPolicy in *AWS SDK for Kotlin API reference*.

PowerShell

### Tools for PowerShell

#### Example 1: The command removes the bucket policy associated with the given S3 bucket.

```
Remove-S3BucketPolicy -BucketName 's3testbucket'
```

- For API details, see DeleteBucketPolicy in *AWS Tools for PowerShell Cmdlet Reference*.

Python

```
# Wraps an Amazon S3 bucket policy.
class BucketPolicyWrapper
  attr_reader :bucket_policy

  # @param bucket_policy [Aws::S3::BucketPolicy] A bucket policy object
 configured with an existing bucket.
  def initialize(bucket_policy)
    @bucket_policy = bucket_policy
  end

  def delete_policy
    @bucket_policy.delete
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't delete the policy from #{@bucket_policy.bucket.name}. Here's
 why: #{e.message}"
    false
  end

end
```

- For API details, see DeleteBucketPolicy in *AWS SDK for Ruby API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `DeleteBucketReplication` with an AWS SDK or CLI

The following code examples show how to use `DeleteBucketReplication`.

CLI

**AWS CLI**

The following command deletes a replication configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-replication --bucket my-bucket
```

- For API details, see DeleteBucketReplication in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: Deletes the replication configuration associated with the bucket named 'mybucket'. Note that this operation requires permission for the s3:DeleteReplicationConfiguration action. You will be prompted for confirmation before the operation proceeds - to suppress confirmation, use the -Force switch.**

```
Remove-S3BucketReplication -BucketName mybucket
```

- For API details, see DeleteBucketReplication in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `DeleteBucketTagging` with an AWS SDK or CLI

The following code examples show how to use `DeleteBucketTagging`.

CLI

**AWS CLI**

The following command deletes a tagging configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-tagging --bucket my-bucket
```

- For API details, see DeleteBucketTagging in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command removes all the tags associated with the given S3 bucket.**

```
Remove-S3BucketTagging -BucketName 's3testbucket'
```

**Output:**

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketTagging (DeleteBucketTagging)" on target
 "s3testbucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is
 "Y"): Y
```

- For API details, see DeleteBucketTagging in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `DeleteBucketWebsite` with an AWS SDK or CLI

The following code examples show how to use `DeleteBucketWebsite`.

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::S3::deleteBucketWebsite(const Aws::String &bucketName,
```

```
                                        const Aws::S3::S3ClientConfiguration
 &clientConfig) {
    Aws::S3::S3Client client(clientConfig);
    Aws::S3::Model::DeleteBucketWebsiteRequest request;
    request.SetBucket(bucketName);

    Aws::S3::Model::DeleteBucketWebsiteOutcome outcome =
            client.DeleteBucketWebsite(request);

    if (!outcome.IsSuccess()) {
        auto err = outcome.GetError();
        std::cerr << "Error: deleteBucketWebsite: " <<
                  err.GetExceptionName() << ": " << err.GetMessage() <<
 std::endl;
    } else {
        std::cout << "Website configuration was removed." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see DeleteBucketWebsite in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The following command deletes a website configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-website --bucket my-bucket
```

- For API details, see DeleteBucketWebsite in *AWS CLI Command Reference*.

Java

## Use `DeleteObject` with an AWS SDK or CLI

The following code examples show how to use `DeleteObject`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Work with Amazon S3 object integrity
- Work with versioned objects

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Delete an object in a non-versioned S3 bucket.

```
using System;
using System.Threading.Tasks;
using Amazon.S3;
using Amazon.S3.Model;

/// <summary>
/// This example shows how to delete an object from a non-versioned Amazon
/// Simple Storage Service (Amazon S3) bucket.
/// </summary>
public class DeleteObject
{
    /// <summary>
```

```
        /// The Main method initializes the necessary variables and then calls
        /// the DeleteObjectNonVersionedBucketAsync method to delete the object
        /// named by the keyName parameter.
        /// </summary>
        public static async Task Main()
        {
            const string bucketName = "doc-example-bucket";
            const string keyName = "testfile.txt";

            // If the Amazon S3 bucket is located in an AWS Region other than the
            // Region of the default account, define the AWS Region for the
            // Amazon S3 bucket in your call to the AmazonS3Client constructor.
            // For example RegionEndpoint.USWest2.
            IAmazonS3 client = new AmazonS3Client();
            await DeleteObjectNonVersionedBucketAsync(client, bucketName,
keyName);
        }

        /// <summary>
        /// The DeleteObjectNonVersionedBucketAsync takes care of deleting the
        /// desired object from the named bucket.
        /// </summary>
        /// <param name="client">An initialized Amazon S3 client used to delete
        /// an object from an Amazon S3 bucket.</param>
        /// <param name="bucketName">The name of the bucket from which the
        /// object will be deleted.</param>
        /// <param name="keyName">The name of the object to delete.</param>
        public static async Task DeleteObjectNonVersionedBucketAsync(IAmazonS3
client, string bucketName, string keyName)
        {
            try
            {
                var deleteObjectRequest = new DeleteObjectRequest
                {
                    BucketName = bucketName,
                    Key = keyName,
                };

                Console.WriteLine($"Deleting object: {keyName}");
                await client.DeleteObjectAsync(deleteObjectRequest);
                Console.WriteLine($"Object: {keyName} deleted from
{bucketName}.");
            }
            catch (AmazonS3Exception ex)
```

```
            {
                Console.WriteLine($"Error encountered on server.
Message:'{ex.Message}' when deleting an object.");
            }
        }
    }
```

Delete an object in a versioned S3 bucket.

```
    using System;
    using System.Threading.Tasks;
    using Amazon.S3;
    using Amazon.S3.Model;

    /// <summary>

## Use `DeleteObjectTagging` with an AWS SDK or CLI

The following code examples show how to use `DeleteObjectTagging`.

CLI

### AWS CLI

#### To delete the tag sets of an object

The following `delete-object-tagging` example deletes the tag with the specified key from the object `doc1.rtf`.

```
aws s3api delete-object-tagging \
    --bucket my-bucket \
    --key doc1.rtf
```

This command produces no output.

- For API details, see DeleteObjectTagging in *AWS CLI Command Reference*.

PowerShell

### Tools for PowerShell

#### Example 1: This command removes all the tags associated with the object with key 'testfile.txt' in the given S3 Bucket.

```
Remove-S3ObjectTagSet -Key 'testfile.txt' -BucketName 's3testbucket' -Select
 '^Key'
```

#### Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3ObjectTagSet (DeleteObjectTagging)" on target
 "testfile.txt".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is
 "Y"): Y
testfile.txt
```

- For API details, see DeleteObjectTagging in *AWS Tools for PowerShell Cmdlet Reference*.

CLI

**AWS CLI**

The following command deletes an object from a bucket named `my-bucket`:

```
aws s3api delete-objects --bucket my-bucket --delete file://delete.json
```

`delete.json` is a JSON document in the current directory that specifies the object to delete:

```
{
  "Objects": [
    {
      "Key": "test1.txt"
    }
  ],
  "Quiet": false
}
```

Output:

```
{
    "Deleted": [
        {
            "DeleteMarkerVersionId": "mYAT5Mc6F7aeUL8SS7FAAqUPO1koHwzU",
```

```
            "Key": "test1.txt",
            "DeleteMarker": true
        }
    ]
}
```

- For API details, see DeleteObjects in *AWS CLI Command Reference*.

                $objects[] = [
                    'Key' => $content['Key'],
                ];
            }
            $this->s3client->deleteObjects([
                'Bucket' => $this->bucketName,
                'Delete' => [
                    'Objects' => $objects,
                ],
            ]);
            $check = $this->s3client->listObjectsV2([
                'Bucket' => $this->bucketName,
            ]);
            if (count($check) <= 0) {
                throw new Exception("Bucket wasn't empty.");
            }
            echo "Deleted all objects and folders from $this->bucketName.\n";
        } catch (Exception $exception) {
            echo "Failed to delete $fileName from $this->bucketName with error:
" . $exception->getMessage();
            exit("Please fix error with object deletion before continuing.");
        }
```

- For API details, see DeleteObjects in *AWS SDK for PHP API Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command removes the object "sample.txt" from bucket "test-files". You are prompted for confirmation before the command executes; to suppress the prompt use the -Force switch.**

```
Remove-S3Object -BucketName test-files -Key sample.txt
```

**Example 2: This command removes the specified version of object "sample.txt" from bucket "test-files", assuming the bucket has been configured to enable object versions.**

```
Remove-S3Object -BucketName test-files -Key sample.txt -VersionId
 HLbxnx6V9omT6AQYVpks8mmFKQcejpqt
```

**Example 3: This command removes objects "sample1.txt", "sample2.txt" and "sample3.txt" from bucket "test-files" as a single batch operation. The service response will list all keys processed, regardless of the success or error status of the deletion. To obtain only errors for keys that were not able to be processed by the service add the -ReportErrorsOnly parameter (this parameter can also be specified with the alias -Quiet.**

```
Remove-S3Object -BucketName test-files -KeyCollection @( "sample1.txt",
 "sample2.txt", "sample3.txt" )
```

**Example 4: This example uses an inline expression with the -KeyCollection parameter to obtain the keys of the objects to delete. Get-S3Object returns a collection of Amazon.S3.Model.S3Object instances, each of which has a Key member of type string identifying the object.**

```
Remove-S3Object -bucketname "test-files" -KeyCollection (Get-S3Object "test-
files" -KeyPrefix "prefix/subprefix" | select -ExpandProperty Key)
```

**Example 5: This example obtains all objects that have a key prefix "prefix/subprefix" in the bucket and deletes them. Note that the incoming objects are processed one at a time. For large collections consider passing the collection to the cmdlet's -InputObject (alias -S3ObjectCollection) parameter to enable the deletion to occur as a batch with a single call to the service.**

```
Get-S3Object -BucketName "test-files" -KeyPrefix "prefix/subprefix" | Remove-
S3Object -Force
```

**Example 6: This example pipes a collection of Amazon.S3.Model.S3ObjectVersion instances that represent delete markers to the cmdlet for deletion. Note that the incoming objects are processed one at a time. For large collections consider passing the collection to the cmdlet's -InputObject (alias -S3ObjectCollection) parameter to enable the deletion to occur as a batch with a single call to the service.**

```
(Get-S3Version -BucketName "test-files").Versions | Where {$_.IsDeleteMarker -eq
 "True"} | Remove-S3Object -Force
```

**Example 7: This script shows how to perform a batch delete of a set of objects (in this case delete markers) by constructing an array of objects to be used with the -KeyAndVersionCollection parameter.**

```
$keyVersions = @()
$markers = (Get-S3Version -BucketName $BucketName).Versions | Where
 {$_.IsDeleteMarker -eq "True"}
foreach ($marker in $markers) { $keyVersions += @{ Key = $marker.Key; VersionId =
 $marker.VersionId } }
Remove-S3Object -BucketName $BucketName -KeyAndVersionCollection $keyVersions -
Force
```

- For API details, see DeleteObjects in *AWS Tools for PowerShell Cmdlet Reference*.

Python

Swift

**SDK for Swift**

> **Note**
>
> This is prerelease documentation for an SDK in preview release. It is subject to change.

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    public func deleteObjects(bucket: String, keys: [String]) async throws {
```

```
        let input = DeleteObjectsInput(
            bucket: bucket,
            delete: S3ClientTypes.Delete(
                objects: keys.map({ S3ClientTypes.ObjectIdentifier(key: $0) }),
                quiet: true
            )
        )

        do {
            let output = try await client.deleteObjects(input: input)

            // As of the last update to this example, any errors are returned
            // in the `output` object's `errors` property. If there are any
            // errors in this array, throw an exception. Once the error
            // handling is finalized in later updates to the AWS SDK for
            // Swift, this example will be updated to handle errors better.

            guard let errors = output.errors else {
                return  // No errors.
            }
            if errors.count != 0 {
                throw ServiceHandlerError.deleteObjectsError
            }
        } catch {
            throw error
        }
    }
```

- For API details, see DeleteObjects in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `DeletePublicAccessBlock` with an AWS SDK or CLI

The following code examples show how to use `DeletePublicAccessBlock`.

CLI

**AWS CLI**

**To delete the block public access configuration for a bucket**

The following `delete-public-access-block` example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \
    --bucket my-bucket
```

This command produces no output.

- For API details, see DeletePublicAccessBlock in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command turns off the block public access setting for the given bucket.**

```
Remove-S3PublicAccessBlock -BucketName 's3testbucket' -Force -Select
 '^BucketName'
```

**Output:**

```
s3testbucket
```

- For API details, see DeletePublicAccessBlock in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketAccelerateConfiguration` with an AWS SDK or CLI

The following code examples show how to use `GetBucketAccelerateConfiguration`.

CLI

**AWS CLI**

**To retrieve the accelerate configuration of a bucket**

The following `get-bucket-accelerate-configuration` example retrieves the accelerate configuration for the specified bucket.

```
aws s3api get-bucket-accelerate-configuration \
    --bucket my-bucket
```

Output:

```
{
    "Status": "Enabled"
}
```

- For API details, see GetBucketAccelerateConfiguration in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command returns the value Enabled, if the transfer acceleration settings is enabled for the bucket specified.**

```
Get-S3BucketAccelerateConfiguration -BucketName 's3testbucket'
```

**Output:**

```
Value
-----
Enabled
```

- For API details, see GetBucketAccelerateConfiguration in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketAcl` with an AWS SDK or CLI

The following code examples show how to use `GetBucketAcl`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage access control lists (ACLs)

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        /// <summary>
        /// Get the access control list (ACL) for the new bucket.
        /// </summary>
        /// <param name="client">The initialized client object used to get the
        /// access control list (ACL) of the bucket.</param>
        /// <param name="newBucketName">The name of the newly created bucket.</
param>
        /// <returns>An S3AccessControlList.</returns>
        public static async Task<S3AccessControlList>
 GetACLForBucketAsync(IAmazonS3 client, string newBucketName)
        {
            // Retrieve bucket ACL to show that the ACL was properly applied to
            // the new bucket.
            GetACLResponse getACLResponse = await client.GetACLAsync(new
 GetACLRequest
            {
                BucketName = newBucketName,
```

```
            });

            return getACLResponse.AccessControlList;
        }
```

- For API details, see GetBucketAcl in *AWS SDK for .NET API Reference*.

C++

**SDK for C++**

- For API details, see GetBucketAcl in *AWS SDK for JavaScript API Reference*.

Python

### SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def get_acl(self):
        """
        Get the ACL of the bucket.

        :return: The ACL of the bucket.
        """
        try:
            acl = self.bucket.Acl()
            logger.info(
                "Got ACL for bucket %s. Owner is %s.", self.bucket.name,
 acl.owner
            )
        except ClientError:
            logger.exception("Couldn't get ACL for bucket %s.", self.bucket.name)
            raise
        else:
            return acl
```

- For API details, see GetBucketAcl in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketAnalyticsConfiguration` with an AWS SDK or CLI

The following code examples show how to use `GetBucketAnalyticsConfiguration`.

CLI

**AWS CLI**

**To retrieve the analytics configuration for a bucket with a specific ID**

The following `get-bucket-analytics-configuration` example displays the analytics configuration for the specified bucket and ID.

```
aws s3api get-bucket-analytics-configuration \
    --bucket my-bucket \
    --id 1
```

Output:

```
{
    "AnalyticsConfiguration": {
        "StorageClassAnalysis": {},
        "Id": "1"
    }
}
```

- For API details, see GetBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command returns the details of the analytics filter with the name 'testfilter' in the given S3 bucket.**

```
Get-S3BucketAnalyticsConfiguration -BucketName 's3testbucket' -AnalyticsId
 'testfilter'
```

- For API details, see GetBucketAnalyticsConfiguration in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketCors` with an AWS SDK or CLI

The following code examples show how to use `GetBucketCors`.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        /// <summary>
        /// Retrieve the CORS configuration applied to the Amazon S3 bucket.
        /// </summary>
        /// <param name="client">The initialized Amazon S3 client object used
        /// to retrieve the CORS configuration.</param>
        /// <returns>The created CORS configuration object.</returns>
        private static async Task<CORSConfiguration>
RetrieveCORSConfigurationAsync(AmazonS3Client client)
        {
            GetCORSConfigurationRequest request = new
GetCORSConfigurationRequest()
            {
                BucketName = BucketName,
            };
            var response = await client.GetCORSConfigurationAsync(request);
```

```
            var configuration = response.Configuration;
            PrintCORSRules(configuration);
            return configuration;
        }
```

- For API details, see GetBucketCors in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

The following command retrieves the Cross-Origin Resource Sharing configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-cors --bucket my-bucket
```

Output:

```
{
    "CORSRules": [
        {
            "AllowedHeaders": [
                "*"
            ],
            "ExposeHeaders": [
                "x-amz-server-side-encryption"
            ],
            "AllowedMethods": [
                "PUT",
                "POST",
                "DELETE"
            ],
            "MaxAgeSeconds": 3000,
            "AllowedOrigins": [
                "http://www.example.com"
            ]
        },
        {
            "AllowedHeaders": [
                "Authorization"
```

```
            ],
            "MaxAgeSeconds": 3000,
            "AllowedMethods": [
                "GET"
            ],
            "AllowedOrigins": [
                "*"
            ]
        }
    ]
}
```

- For API details, see GetBucketCors in *AWS CLI Command Reference*.

JavaScript

**SDK for JavaScript (v3)**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Get the CORS policy for the bucket.

```
import { GetBucketCorsCommand, S3Client } from "@aws-sdk/client-s3";

const client = new S3Client({});

export const main = async () => {
  const command = new GetBucketCorsCommand({
    Bucket: "test-bucket",
  });

  try {
    const { CORSRules } = await client.send(command);
    CORSRules.forEach((cr, i) => {
      console.log(
        `\nCORSRule ${i + 1}`,
        `\n${"-".repeat(10)}`,
        `\nAllowedHeaders: ${cr.AllowedHeaders.join(" ")}`,
```

```
        `\nAllowedMethods: ${cr.AllowedMethods.join(" ")}`,
        `\nAllowedOrigins: ${cr.AllowedOrigins.join(" ")}`,
        `\nExposeHeaders: ${cr.ExposeHeaders.join(" ")}`,
        `\nMaxAgeSeconds: ${cr.MaxAgeSeconds}`,
      );
    });
  } catch (err) {
    console.error(err);
  }
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see GetBucketCors in *AWS SDK for JavaScript API Reference*.

Python

**SDK for Python (Boto3)**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def get_cors(self):
        """
        Get the CORS rules for the bucket.
```

```
        :return The CORS rules for the specified bucket.
        """
        try:
            cors = self.bucket.Cors()
            logger.info(
                "Got CORS rules %s for bucket '%s'.", cors.cors_rules,
 self.bucket.name
            )
        except ClientError:
            logger.exception(("Couldn't get CORS for bucket %s.",
 self.bucket.name))
            raise
        else:
            return cors
```

- For API details, see GetBucketCors in *AWS SDK for Python (Boto3) API Reference*.

Ruby

**SDK for Ruby**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
require "aws-sdk-s3"

# Wraps Amazon S3 bucket CORS configuration.
class BucketCorsWrapper
  attr_reader :bucket_cors

  # @param bucket_cors [Aws::S3::BucketCors] A bucket CORS object configured with
 an existing bucket.
  def initialize(bucket_cors)
    @bucket_cors = bucket_cors
  end
```

```
  # Gets the CORS configuration of a bucket.
  #
  # @return [Aws::S3::Type::GetBucketCorsOutput, nil] The current CORS
 configuration for the bucket.
  def get_cors
    @bucket_cors.data
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't get CORS configuration for #{@bucket_cors.bucket.name}. Here's
 why: #{e.message}"
    nil
  end

end
```

- For API details, see GetBucketCors in *AWS SDK for Ruby API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketEncryption` with an AWS SDK or CLI

The following code examples show how to use `GetBucketEncryption`.

CLI

### AWS CLI

#### To retrieve the server-side encryption configuration for a bucket

The following `get-bucket-encryption` example retrieves the server-side encryption configuration for the bucket `my-bucket`.

```
aws s3api get-bucket-encryption \
    --bucket my-bucket
```

Output:

```
{
    "ServerSideEncryptionConfiguration": {
        "Rules": [
```

```
            {
                "ApplyServerSideEncryptionByDefault": {
                    "SSEAlgorithm": "AES256"
                }
            }
        ]
    }
}
```

- For API details, see GetBucketEncryption in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command returns all the server side encryption rules associated with the given bucket.**

```
Get-S3BucketEncryption -BucketName 's3casetestbucket'
```

- For API details, see GetBucketEncryption in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketInventoryConfiguration` with an AWS SDK or CLI

The following code examples show how to use `GetBucketInventoryConfiguration`.

CLI

**AWS CLI**

**To retrieve the inventory configuration for a bucket**

The following `get-bucket-inventory-configuration` example retrieves the inventory configuration for the specified bucket with ID 1.

```
aws s3api get-bucket-inventory-configuration \
    --bucket my-bucket \
```

```
    --id 1
```

Output:

```
{
    "InventoryConfiguration": {
        "IsEnabled": true,
        "Destination": {
            "S3BucketDestination": {
                "Format": "ORC",
                "Bucket": "arn:aws:s3:::my-bucket",
                "AccountId": "123456789012"
            }
        },
        "IncludedObjectVersions": "Current",
        "Id": "1",
        "Schedule": {
            "Frequency": "Weekly"
        }
    }
}
```

- For API details, see GetBucketInventoryConfiguration in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command returns the details of the inventory named 'testinventory' for the given S3 bucket.**

```
Get-S3BucketInventoryConfiguration -BucketName 's3testbucket' -InventoryId
 'testinventory'
```

- For API details, see GetBucketInventoryConfiguration in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

# Use `GetBucketLifecycleConfiguration` with an AWS SDK or CLI

The following code examples show how to use `GetBucketLifecycleConfiguration`.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        /// <summary>
        /// Returns a configuration object for the supplied bucket name.
        /// </summary>
        /// <param name="client">The S3 client object used to call
        /// the GetLifecycleConfigurationAsync method.</param>
        /// <param name="bucketName">The name of the S3 bucket for which a
        /// configuration will be created.</param>
        /// <returns>Returns a new LifecycleConfiguration object.</returns>
        public static async Task<LifecycleConfiguration>
RetrieveLifecycleConfigAsync(IAmazonS3 client, string bucketName)
        {
            var request = new GetLifecycleConfigurationRequest()
            {
                BucketName = bucketName,
            };
            var response = await client.GetLifecycleConfigurationAsync(request);
            var configuration = response.Configuration;
            return configuration;
        }
```

- For API details, see GetBucketLifecycleConfiguration in *AWS SDK for .NET API Reference*.

CLI

### AWS CLI

The following command retrieves the lifecycle configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-lifecycle-configuration --bucket my-bucket
```

Output:

```
{
    "Rules": [
        {
            "ID": "Move rotated logs to Glacier",
            "Prefix": "rotated/",
            "Status": "Enabled",
            "Transitions": [
                {
                    "Date": "2015-11-10T00:00:00.000Z",
                    "StorageClass": "GLACIER"
                }
            ]
        },
        {
            "Status": "Enabled",
            "Prefix": "",
            "NoncurrentVersionTransitions": [
                {
                    "NoncurrentDays": 0,
                    "StorageClass": "GLACIER"
                }
            ],
            "ID": "Move old versions to Glacier"
        }
    ]
}
```

- For API details, see GetBucketLifecycleConfiguration in *AWS CLI Command Reference*.

Python

### SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def get_lifecycle_configuration(self):
        """
        Get the lifecycle configuration of the bucket.

        :return: The lifecycle rules of the specified bucket.
        """
        try:
            config = self.bucket.LifecycleConfiguration()
            logger.info(
                "Got lifecycle rules %s for bucket '%s'.",
                config.rules,
                self.bucket.name,
            )
        except:
            logger.exception(
                "Couldn't get lifecycle rules for bucket '%s'.", self.bucket.name
            )
            raise
        else:
```

```
            return config.rules

```

- For API details, see GetBucketLifecycleConfiguration in *AWS SDK for Python (Boto3) API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketLocation` with an AWS SDK or CLI

The following code examples show how to use `GetBucketLocation`.

CLI

### AWS CLI

The following command retrieves the location constraint for a bucket named `my-bucket`, if a constraint exists:

```
aws s3api get-bucket-location --bucket my-bucket
```

Output:

```
{
    "LocationConstraint": "us-west-2"
}
```

- For API details, see GetBucketLocation in *AWS CLI Command Reference*.

PowerShell

### Tools for PowerShell

**Example 1: This command returns the location constraint for the bucket 's3testbucket', if a constraint exists.**

```
Get-S3BucketLocation -BucketName 's3testbucket'
```

**Output:**

```
Value
-----
ap-south-1
```

- For API details, see GetBucketLocation in *AWS Tools for PowerShell Cmdlet Reference*.

Rust

**SDK for Rust**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
async fn show_buckets(strict: bool, client: &Client, region: &str) -> Result<(),
 Error> {
    let resp = client.list_buckets().send().await?;
    let buckets = resp.buckets();
    let num_buckets = buckets.len();

    let mut in_region = 0;

    for bucket in buckets {
        if strict {
            let r = client
                .get_bucket_location()
                .bucket(bucket.name().unwrap_or_default())
                .send()
                .await?;

            if r.location_constraint().unwrap().as_ref() == region {
                println!("{}", bucket.name().unwrap_or_default());
                in_region += 1;
            }
        } else {
            println!("{}", bucket.name().unwrap_or_default());
        }
```

```
    }

    println!();
    if strict {
        println!(
            "Found {} buckets in the {} region out of a total of {} buckets.",
            in_region, region, num_buckets
        );
    } else {
        println!("Found {} buckets in all regions.", num_buckets);
    }

    Ok(())
}
```

- For API details, see GetBucketLocation in *AWS SDK for Rust API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketLogging` with an AWS SDK or CLI

The following code examples show how to use `GetBucketLogging`.

CLI

### AWS CLI

#### To retrieve the logging status for a bucket

The following `get-bucket-logging` example retrieves the logging status for the specified bucket.

```
aws s3api get-bucket-logging \
    --bucket my-bucket
```

Output:

```
{
```

```
    "LoggingEnabled": {
        "TargetPrefix": "",
        "TargetBucket": "my-bucket-logs"
          }
}
```

- For API details, see GetBucketLogging in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command returns the logging status for the specified bucket.**

```
Get-S3BucketLogging -BucketName 's3testbucket'
```

**Output:**

```
TargetBucketName   Grants TargetPrefix
----------------   ------ ------------
testbucket1        {}     testprefix
```

- For API details, see GetBucketLogging in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketMetricsConfiguration` with an AWS SDK or CLI

The following code examples show how to use `GetBucketMetricsConfiguration`.

CLI

**AWS CLI**

**To retrieve the metrics configuration for a bucket with a specific ID**

The following `get-bucket-metrics-configuration` example displays the metrics configuration for the specified bucket and ID.

```
aws s3api get-bucket-metrics-configuration \
    --bucket my-bucket \
    --id 123
```

Output:

```
{
    "MetricsConfiguration": {
        "Filter": {
            "Prefix": "logs"
        },
        "Id": "123"
    }
}
```

- For API details, see GetBucketMetricsConfiguration in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command returns the details about the metrics filter named 'testfilter' for the given S3 bucket.**

```
Get-S3BucketMetricsConfiguration -BucketName 's3testbucket' -MetricsId
 'testfilter'
```

- For API details, see GetBucketMetricsConfiguration in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketNotification` with an AWS SDK or CLI

The following code examples show how to use `GetBucketNotification`.

CLI

### AWS CLI

The following command retrieves the notification configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-notification --bucket my-bucket
```

Output:

```
{
    "TopicConfiguration": {
        "Topic": "arn:aws:sns:us-west-2:123456789012:my-notification-topic",
        "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWNl",
        "Event": "s3:ObjectCreated:*",
        "Events": [
            "s3:ObjectCreated:*"
        ]
    }
}
```

- For API details, see GetBucketNotification in *AWS CLI Command Reference*.

PowerShell

### Tools for PowerShell

#### Example 1: This example retrieves notification configuration of the given bucket

```
Get-S3BucketNotification -BucketName kt-tools | select -ExpandProperty
 TopicConfigurations
```

**Output:**

```
Id   Topic
--   -----
mimo arn:aws:sns:eu-west-1:123456789012:topic-1
```

- For API details, see GetBucketNotification in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketPolicy` with an AWS SDK or CLI

The following code examples show how to use `GetBucketPolicy`.

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::S3::getBucketPolicy(const Aws::String &bucketName,
                                 const Aws::S3::S3ClientConfiguration
 &clientConfig) {
    Aws::S3::S3Client s3Client(clientConfig);

    Aws::S3::Model::GetBucketPolicyRequest request;
    request.SetBucket(bucketName);

    Aws::S3::Model::GetBucketPolicyOutcome outcome =
            s3Client.GetBucketPolicy(request);

    if (!outcome.IsSuccess()) {
        const Aws::S3::S3Error &err = outcome.GetError();
        std::cerr << "Error: getBucketPolicy: "
                  << err.GetExceptionName() << ": " << err.GetMessage() <<
 std::endl;
    } else {
        Aws::StringStream policy_stream;
        Aws::String line;

        outcome.GetResult().GetPolicy() >> line;
        policy_stream << line;
```

```
        std::cout << "Retrieve the policy for bucket '" << bucketName << "':\n\n"
 <<
                  policy_stream.str() << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see GetBucketPolicy in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The following command retrieves the bucket policy for a bucket named `my-bucket`:

```
aws s3api get-bucket-policy --bucket my-bucket
```

Output:

```
{
    "Policy": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Sid\":\"\",\"Effect
\":\"Allow\",\"Principal\":\"*\",\"Action\":\"s3:GetObject\",\"Resource\":
\"arn:aws:s3:::my-bucket/*\"},{\"Sid\":\"\",\"Effect\":\"Deny\",\"Principal\":
\"*\",\"Action\":\"s3:GetObject\",\"Resource\":\"arn:aws:s3:::my-bucket/secret/*
\"}]}"
}
```

Get and put a bucket policyThe following example shows how you can download an Amazon S3 bucket policy, make modifications to the file, and then use `put-bucket-policy` to apply the modified bucket policy. To download the bucket policy to a file, you can run:

```
aws s3api get-bucket-policy --bucket mybucket --query Policy --output text >
 policy.json
```

You can then modify the `policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

`policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

```
aws s3api put-bucket-policy --bucket mybucket --policy file://policy.json
```

- For API details, see GetBucketPolicy in *AWS CLI Command Reference*.

Java

**SDK for Java 2.x**

JavaScript

### SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Get the bucket policy.

```
import { GetBucketPolicyCommand, S3Client } from "@aws-sdk/client-s3";

const client = new S3Client({});

export const main = async () => {
  const command = new GetBucketPolicyCommand({
    Bucket: "test-bucket",
  });

  try {
    const { Policy } = await client.send(command);
    console.log(JSON.parse(Policy));
  } catch (err) {
    console.error(err);
  }
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see GetBucketPolicy in *AWS SDK for JavaScript API Reference*.

Kotlin

### SDK for Kotlin

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
suspend fun getPolicy(bucketName: String): String? {
    println("Getting policy for bucket $bucketName")

    val request =
        GetBucketPolicyRequest {
            bucket = bucketName
        }

    S3Client { region = "us-east-1" }.use { s3 ->
        val policyRes = s3.getBucketPolicy(request)
        return policyRes.policy
    }
}
```

- For API details, see GetBucketPolicy in *AWS SDK for Kotlin API reference*.

PowerShell

### Tools for PowerShell

#### Example 1: This command outputs the bucket policy associated with the given S3 bucket.

```
Get-S3BucketPolicy -BucketName 's3testbucket'
```

- For API details, see GetBucketPolicy in *AWS Tools for PowerShell Cmdlet Reference*.

Python

### SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def get_policy(self):
        """
        Get the security policy of the bucket.

        :return: The security policy of the specified bucket, in JSON format.
        """
        try:
            policy = self.bucket.Policy()
            logger.info(
                "Got policy %s for bucket '%s'.", policy.policy, self.bucket.name
            )
        except ClientError:
            logger.exception("Couldn't get policy for bucket '%s'.",
 self.bucket.name)
            raise
        else:
            return json.loads(policy.policy)
```

- For API details, see GetBucketPolicy in *AWS SDK for Python (Boto3) API Reference*.

Ruby

**SDK for Ruby**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
# Wraps an Amazon S3 bucket policy.
class BucketPolicyWrapper
  attr_reader :bucket_policy

  # @param bucket_policy [Aws::S3::BucketPolicy] A bucket policy object
 configured with an existing bucket.
  def initialize(bucket_policy)
    @bucket_policy = bucket_policy
  end

  # Gets the policy of a bucket.
  #
  # @return [Aws::S3::GetBucketPolicyOutput, nil] The current bucket policy.
  def get_policy
    policy = @bucket_policy.data.policy
    policy.respond_to?(:read) ? policy.read : policy
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't get the policy for #{@bucket_policy.bucket.name}. Here's why:
 #{e.message}"
    nil
  end

end
```

- For API details, see GetBucketPolicy in *AWS SDK for Ruby API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketPolicyStatus` with an AWS SDK or CLI

The following code examples show how to use `GetBucketPolicyStatus`.

CLI

### AWS CLI

#### To retrieve the policy status for a bucket indicating whether the bucket is public

The following `get-bucket-policy-status` example retrieves the policy status for the bucket `my-bucket`.

```
aws s3api get-bucket-policy-status \
    --bucket my-bucket
```

Output:

```
{
    "PolicyStatus": {
        "IsPublic": false
    }
}
```

- For API details, see GetBucketPolicyStatus in *AWS CLI Command Reference*.

PowerShell

### Tools for PowerShell

#### Example 1: This command returns policy status for the given S3 bucket, indicating whether the bucket is public.

```
Get-S3BucketPolicyStatus -BucketName 's3casetestbucket'
```

- For API details, see GetBucketPolicyStatus in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketReplication` with an AWS SDK or CLI

The following code examples show how to use `GetBucketReplication`.

CLI

### AWS CLI

The following command retrieves the replication configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-replication --bucket my-bucket
```

Output:

```
{
    "ReplicationConfiguration": {
        "Rules": [
            {
                "Status": "Enabled",
                "Prefix": "",
                "Destination": {
                    "Bucket": "arn:aws:s3:::my-bucket-backup",
                    "StorageClass": "STANDARD"
                },
                "ID": "ZmUwNzE4ZmQ4tMjVhOS00MTlkLOGI4NDkzZTIWJjNTUtYTA1"
            }
        ],
        "Role": "arn:aws:iam::123456789012:role/s3-replication-role"
    }
}
```

- For API details, see GetBucketReplication in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: Returns the replication configuration information set on the bucket named 'mybucket'.**

```
Get-S3BucketReplication -BucketName mybucket
```

- For API details, see GetBucketReplication in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketRequestPayment` with an AWS SDK or CLI

The following code examples show how to use `GetBucketRequestPayment`.

CLI

**AWS CLI**

**To retrieve the request payment configuration for a bucket**

The following `get-bucket-request-payment` example retrieves the requester pays configuration for the specified bucket.

```
aws s3api get-bucket-request-payment \
    --bucket my-bucket
```

Output:

```
{
    "Payer": "BucketOwner"
}
```

- For API details, see GetBucketRequestPayment in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: Returns the request payment configuration for the bucket named 'mybucket'. By default, the bucket owner pays for downloads from the bucket.**

```
Get-S3BucketRequestPayment -BucketName mybucket
```

- For API details, see GetBucketRequestPayment in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketTagging` with an AWS SDK or CLI

The following code examples show how to use `GetBucketTagging`.

CLI

**AWS CLI**

The following command retrieves the tagging configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-tagging --bucket my-bucket
```

Output:

```
{
    "TagSet": [
        {
            "Value": "marketing",
            "Key": "organization"
        }
    ]
}
```

- For API details, see GetBucketTagging in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command returns all the tags associated with the given bucket.**

```
Get-S3BucketTagging -BucketName 's3casetestbucket'
```

- For API details, see GetBucketTagging in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketVersioning` with an AWS SDK or CLI

The following code examples show how to use `GetBucketVersioning`.

CLI

**AWS CLI**

The following command retrieves the versioning configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-versioning --bucket my-bucket
```

Output:

```
{
    "Status": "Enabled"
}
```

- For API details, see GetBucketVersioning in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command returns the status of versioning with respect to the given bucket.**

```
Get-S3BucketVersioning -BucketName 's3testbucket'
```

- For API details, see GetBucketVersioning in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetBucketWebsite` with an AWS SDK or CLI

The following code examples show how to use `GetBucketWebsite`.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
                // Get the website configuration.
                GetBucketWebsiteRequest getRequest = new
GetBucketWebsiteRequest()
                {
                    BucketName = bucketName,
                };
                GetBucketWebsiteResponse getResponse = await
client.GetBucketWebsiteAsync(getRequest);
                Console.WriteLine($"Index document:
{getResponse.WebsiteConfiguration.IndexDocumentSuffix}");
                Console.WriteLine($"Error document:
{getResponse.WebsiteConfiguration.ErrorDocument}");
```

- For API details, see GetBucketWebsite in *AWS SDK for .NET API Reference*.

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::S3::getWebsiteConfig(const Aws::String &bucketName,
                                  const Aws::S3::S3ClientConfiguration
 &clientConfig) {
    Aws::S3::S3Client s3Client(clientConfig);

    Aws::S3::Model::GetBucketWebsiteRequest request;
    request.SetBucket(bucketName);

    Aws::S3::Model::GetBucketWebsiteOutcome outcome =
            s3Client.GetBucketWebsite(request);

    if (!outcome.IsSuccess()) {
        const Aws::S3::S3Error &err = outcome.GetError();

        std::cerr << "Error: GetBucketWebsite: "
                  << err.GetMessage() << std::endl;
    } else {
        Aws::S3::Model::GetBucketWebsiteResult websiteResult =
 outcome.GetResult();

        std::cout << "Success: GetBucketWebsite: "
                  << std::endl << std::endl
                  << "For bucket '" << bucketName << "':"
                  << std::endl
                  << "Index page : "
                  << websiteResult.GetIndexDocument().GetSuffix()
                  << std::endl
```

```
                    << "Error page: "
                    << websiteResult.GetErrorDocument().GetKey()
                    << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see GetBucketWebsite in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The following command retrieves the static website configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-website --bucket my-bucket
```

Output:

```
{
    "IndexDocument": {
        "Suffix": "index.html"
    },
    "ErrorDocument": {
        "Key": "error.html"
    }
}
```

- For API details, see GetBucketWebsite in *AWS CLI Command Reference*.

JavaScript

### SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Get the website configuration.

```
import { GetBucketWebsiteCommand, S3Client } from "@aws-sdk/client-s3";

const client = new S3Client({});

export const main = async () => {
  const command = new GetBucketWebsiteCommand({
    Bucket: "test-bucket",
  });

  try {
    const { ErrorDocument, IndexDocument } = await client.send(command);
    console.log(
      `Your bucket is set up to host a website. It has an error document:`,
      `${ErrorDocument.Key}, and an index document: ${IndexDocument.Suffix}.`,
    );
  } catch (err) {
    console.error(err);
  }
};
```

- For API details, see GetBucketWebsite in *AWS SDK for JavaScript API Reference*.

PowerShell

### Tools for PowerShell

**Example 1: This command returns the details of the static website configurations of the given S3 bucket.**

```
Get-S3BucketWebsite -BucketName 's3testbucket'
```

- For API details, see GetBucketWebsite in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `GetObject` with an AWS SDK or CLI

The following code examples show how to use `GetObject`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Get an object from a bucket if it has been modified
- Get an object from a Multi-Region Access Point
- Get started with buckets and objects
- Get started with encryption
- Track uploads and downloads

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        /// <summary>
        /// Shows how to download an object from an Amazon S3 bucket to the
        /// local computer.
        /// </summary>
```

```
        /// <param name="client">An initialized Amazon S3 client object.</param>
        /// <param name="bucketName">The name of the bucket where the object is
        /// currently stored.</param>
        /// <param name="objectName">The name of the object to download.</param>
        /// <param name="filePath">The path, including filename, where the
        /// downloaded object will be stored.</param>
        /// <returns>A boolean value indicating the success or failure of the
        /// download process.</returns>
        public static async Task<bool> DownloadObjectFromBucketAsync(
            IAmazonS3 client,
            string bucketName,
            string objectName,
            string filePath)
        {
            // Create a GetObject request
            var request = new GetObjectRequest
            {
                BucketName = bucketName,
                Key = objectName,
            };

            // Issue request and remember to dispose of the response
            using GetObjectResponse response = await
 client.GetObjectAsync(request);

            try
            {

```
bool AwsDoc::S3::getObject(const Aws::String &objectKey,
                           const Aws::String &fromBucket,
                           const Aws::S3::S3ClientConfiguration &clientConfig) {
    Aws::S3::S3Client client(clientConfig);

    Aws::S3::Model::GetObjectRequest request;
    request.SetBucket(fromBucket);
    request.SetKey(objectKey);

    Aws::S3::Model::GetObjectOutcome outcome =
            client.GetObject(request);

    if (!outcome.IsSuccess()) {
        const Aws::S3::S3Error &err = outcome.GetError();
        std::cerr << "Error: getObject: " <<
                  err.GetExceptionName() << ": " << err.GetMessage() <<
 std::endl;
    } else {
        std::cout << "Successfully retrieved '" << objectKey << "' from '"
                  << fromBucket << "'." << std::endl;
```

```
    }

    return outcome.IsSuccess();
}
```

- For API details, see GetObject in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The following example uses the `get-object` command to download an object from Amazon S3:

```
aws s3api get-object --bucket text-content --key dir/
my_images.tar.bz2 my_images.tar.bz2
```

Note that the outfile parameter is specified without an option name such as "--outfile". The name of the output file must be the last parameter in the command.

The example below demonstrates the use of `--range` to download a specific byte range from an object. Note the byte ranges needs to be prefixed with "bytes=":

```
aws s3api get-object --bucket text-content --key dir/my_data --
range bytes=8888-9999 my_data_range
```

For more information about retrieving objects, see Getting Objects in the *Amazon S3 Developer Guide*.

- For API details, see GetObject in *AWS CLI Command Reference*.

Get an object.

```
require "aws-sdk-s3"

# Wraps Amazon S3 object actions.
class ObjectGetWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  # Gets the object directly to a file.
  #
  # @param target_path [String] The path to the file where the object is
 downloaded.
  # @return [Aws::S3::Types::GetObjectOutput, nil] The retrieved object data if
 successful; otherwise nil.
  def get_object(target_path)
    @object.get(response_target: target_path)
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't get object #{@object.key}. Here's why: #{e.message}"
  end
```

```
end

# Example usage:
def run_demo
  bucket_name = "doc-example-bucket"
  object_key = "my-object.txt"
  target_path = "my-object-as-file.txt"

  wrapper = ObjectGetWrapper.new(Aws::S3::Object.new(bucket_name, object_key))
  obj_data = wrapper.get_object(target_path)
  return unless obj_data

  puts "Object #{object_key} (#{obj_data.content_length} bytes} downloaded to
 #{target_path}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Get an object and report its server-side encryption state.

```
require "aws-sdk-s3"

# Wraps Amazon S3 object actions.
class ObjectGetEncryptionWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  # Gets the object into memory.
  #
  # @return [Aws::S3::Types::GetObjectOutput, nil] The retrieved object data if
 successful; otherwise nil.
  def get_object
    @object.get
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't get object #{@object.key}. Here's why: #{e.message}"
  end
end
```

```
# Example usage:
def run_demo
  bucket_name = "doc-example-bucket"
  object_key = "my-object.txt"

  wrapper = ObjectGetEncryptionWrapper.new(Aws::S3::Object.new(bucket_name,
 object_key))
  obj_data = wrapper.get_object
  return unless obj_data

  encryption = obj_data.server_side_encryption.nil? ? "no" :
 obj_data.server_side_encryption
  puts "Object #{object_key} uses #{encryption} encryption."
end

run_demo if $PROGRAM_NAME == __FILE__
```

CLI

**AWS CLI**

**To retrieves metadata from an object without returning the object itself**

The following `get-object-attributes` example retrieves metadata from the object `doc1.rtf`.

```
aws s3api get-object-attributes \
    --bucket my-bucket \
    --key doc1.rtf \
    --object-attributes "StorageClass" "ETag" "ObjectSize"
```

Output:

```
{
    "LastModified": "2022-03-15T19:37:31+00:00",
    "VersionId": "IuCPjXTDzHNfldAuitVBIKJpF2p1fg4P",
    "ETag": "b662d79adeb7c8d787ea7eafb9ef6207",
    "StorageClass": "STANDARD",
    "ObjectSize": 405
}
```

For more information, see GetObjectAttributes in the Amazon S3 API Reference.

- For API details, see GetObjectAttributes in *AWS CLI Command Reference*.

## Use `GetObjectLegalHold` with an AWS SDK or CLI

The following code examples show how to use `GetObjectLegalHold`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Get the legal hold configuration of an object
- Lock Amazon S3 objects

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
/// <summary>
/// Get the legal hold details for an S3 object.
/// </summary>
/// <param name="bucketName">The bucket of the object.</param>
/// <param name="objectKey">The object key.</param>
/// <returns>The object legal hold details.</returns>
public async Task<ObjectLockLegalHold> GetObjectLegalHold(string bucketName,
    string objectKey)
{
    try
    {
        var request = new GetObjectLegalHoldRequest()
```

```
            {
                BucketName = bucketName,
                Key = objectKey
            };

            var response = await _amazonS3.GetObjectLegalHoldAsync(request);
            Console.WriteLine($"\tObject legal hold for {objectKey} in
 {bucketName}: " +
                              $"\n\tStatus: {response.LegalHold.Status}");
            return response.LegalHold;
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine($"\tUnable to fetch legal hold: '{ex.Message}'");
            return new ObjectLockLegalHold();
        }
    }
```

- For API details, see GetObjectLegalHold in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

**Retrieves the Legal Hold status of an object**

The following `get-object-legal-hold` example retrieves the Legal Hold status for the specified object.

```
aws s3api get-object-legal-hold \
    --bucket my-bucket-with-object-lock \
    --key doc1.rtf
```

Output:

```
{
    "LegalHold": {
        "Status": "ON"
    }
}
```

- For API details, see GetObjectLegalHold in *AWS CLI Command Reference*.

Go

**SDK for Go V2**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// S3Actions wraps S3 service actions.

            return new ObjectLockConfiguration();
        }
    }
```

- For API details, see GetObjectLockConfiguration in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

**To retrieve an object lock configuration for a bucket**

The following `get-object-lock-configuration` example retrieves the object lock configuration for the specified bucket.

```
aws s3api get-object-lock-configuration \
    --bucket my-bucket-with-object-lock
```

Output:

```
{
    "ObjectLockConfiguration": {
        "ObjectLockEnabled": "Enabled",
        "Rule": {
            "DefaultRetention": {
                "Mode": "COMPLIANCE",
                "Days": 50
            }
        }
    }
}
```

- For API details, see GetObjectLockConfiguration in *AWS CLI Command Reference*.

Go

**SDK for Go V2**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// S3Actions wraps S3 service actions.

        };
```

```
            var response = await _amazonS3.GetObjectRetentionAsync(request);
            Console.WriteLine($"\tObject retention for {objectKey} in
{bucketName}: " +
                              $"\n\t{response.Retention.Mode} until
{response.Retention.RetainUntilDate:d}.");
            return response.Retention;
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine($"\tUnable to fetch object lock retention:
'{ex.Message}'");
            return new ObjectLockRetention();
        }
    }
```

- For API details, see GetObjectRetention in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

**To retrieve the object retention configuration for an object**

The following `get-object-retention` example retrieves the object retention configuration for the specified object.

```
aws s3api get-object-retention \
    --bucket my-bucket-with-object-lock \
    --key doc1.rtf
```

Output:

```
{
    "Retention": {
        "Mode": "GOVERNANCE",
        "RetainUntilDate": "2025-01-01T00:00:00.000Z"
    }
}
```

- For API details, see GetObjectRetention in *AWS CLI Command Reference*.

Go

## Use `GetObjectTagging` with an AWS SDK or CLI

The following code examples show how to use `GetObjectTagging`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Get started with tags

CLI

**AWS CLI**

**To retrieve the tags attached to an object**

The following `get-object-tagging` example retrieves the values for the specified key from the specified object.

```
aws s3api get-object-tagging \
    --bucket my-bucket \
    --key doc1.rtf
```

Output:

```
{
    "TagSet": [
        {
            "Value": "confidential",
            "Key": "designation"
        }
    ]
}
```

The following `get-object-tagging` example tries to retrieve the tag sets of the object `doc2.rtf`, which has no tags.

```
aws s3api get-object-tagging \
    --bucket my-bucket \
    --key doc2.rtf
```

Output:

```
{
    "TagSet": []
}
```

The following `get-object-tagging` example retrieves the tag sets of the object `doc3.rtf`, which has multiple tags.

```
aws s3api get-object-tagging \
    --bucket my-bucket \
    --key doc3.rtf
```

Output:

```
{
    "TagSet": [
        {
            "Value": "confidential",
            "Key": "designation"
        },
        {
            "Value": "finance",
            "Key": "department"
        },
        {
            "Value": "payroll",
            "Key": "team"
        }
    ]
}
```

- For API details, see GetObjectTagging in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: The sample returns the tags associated with the object present on the given S3 bucket.**

```
Get-S3ObjectTagSet -Key 'testfile.txt' -BucketName 'testbucket123'
```

**Output:**

```
Key  Value
---  -----
test value
```

- For API details, see GetObjectTagging in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

# Use `GetPublicAccessBlock` with an AWS SDK or CLI

The following code examples show how to use `GetPublicAccessBlock`.

CLI

### AWS CLI

#### To set or modify the block public access configuration for a bucket

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```
aws s3api get-public-access-block \
    --bucket my-bucket
```

Output:

```
{
    "PublicAccessBlockConfiguration": {
        "IgnorePublicAcls": true,
        "BlockPublicPolicy": true,
        "BlockPublicAcls": true,
        "RestrictPublicBuckets": true
    }
}
```

- For API details, see GetPublicAccessBlock in *AWS CLI Command Reference*.

PowerShell

### Tools for PowerShell

#### Example 1: The command returns the public access block configuration of the given S3 bucket.

```
Get-S3PublicAccessBlock -BucketName 's3testbucket'
```

- For API details, see GetPublicAccessBlock in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use HeadBucket with an AWS SDK or CLI

The following code examples show how to use HeadBucket.

Bash

### AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
###############################################################################
# function bucket_exists
#
# This function checks to see if the specified bucket already exists.
#
# Parameters:
#       $1 - The name of the bucket to check.
#
# Returns:
#       0 - If the bucket already exists.
#       1 - If the bucket doesn't exist.
###############################################################################
function bucket_exists() {
  local bucket_name
  bucket_name=$1

  # Check whether the bucket already exists.
  # We suppress all output - we're interested only in the return code.

  if aws s3api head-bucket \
    --bucket "$bucket_name" \
    >/dev/null 2>&1; then
    return 0 # 0 in Bash script means true.
  else
```

```
    return 1 # 1 in Bash script means false.
  fi
}
```

- For API details, see HeadBucket in *AWS CLI Command Reference*.

CLI

**AWS CLI**

The following command verifies access to a bucket named `my-bucket`:

```
aws s3api head-bucket --bucket my-bucket
```

If the bucket exists and you have access to it, no output is returned. Otherwise, an error message will be shown. For example:

```
A client error (404) occurred when calling the HeadBucket operation: Not Found
```

- For API details, see HeadBucket in *AWS CLI Command Reference*.

Go

**SDK for Go V2**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// BucketBasics encapsulates the Amazon Simple Storage Service (Amazon S3)
 actions
// used in the examples.
// It contains S3Client, an Amazon S3 service client that is used to perform
 bucket
// and object actions.
```

```
type BucketBasics struct {
 S3Client *s3.Client
}

// BucketExists checks whether a bucket exists in the current account.
func (basics BucketBasics) BucketExists(bucketName string) (bool, error) {
 _, err := basics.S3Client.HeadBucket(context.TODO(), &s3.HeadBucketInput{
  Bucket: aws.String(bucketName),
 })
 exists := true
 if err != nil {
  var apiError smithy.APIError
  if errors.As(err, &apiError) {
   switch apiError.(type) {
   case *types.NotFound:
    log.Printf("Bucket %v is available.\n", bucketName)
    exists = false
    err = nil
   default:
    log.Printf("Either you don't have access to bucket %v or another error
 occurred. "+
     "Here's what happened: %v\n", bucketName, err)
   }
  }
 } else {
  log.Printf("Bucket %v exists and you already own it.", bucketName)
 }

 return exists, err
}
```

- For API details, see HeadBucket in *AWS SDK for Go API Reference*.

Python

### SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def exists(self):
        """
        Determine whether the bucket exists and you have access to it.

        :return: True when the bucket exists; otherwise, False.
        """
        try:
            self.bucket.meta.client.head_bucket(Bucket=self.bucket.name)
            logger.info("Bucket %s exists.", self.bucket.name)
            exists = True
        except ClientError:
            logger.warning(
                "Bucket %s doesn't exist or you don't have access to it.",
                self.bucket.name,
            )
            exists = False
        return exists
```

- For API details, see HeadBucket in *AWS SDK for Python (Boto3) API Reference*.

## Use `HeadObject` with an AWS SDK or CLI

The following code examples show how to use `HeadObject`.

CLI

### AWS CLI

The following command retrieves metadata for an object in a bucket named `my-bucket`:

```
aws s3api head-object --bucket my-bucket --key index.html
```

Output:

```
{
    "AcceptRanges": "bytes",
    "ContentType": "text/html",
    "LastModified": "Thu, 16 Apr 2015 18:19:14 GMT",
    "ContentLength": 77,
    "VersionId": "null",
    "ETag": "\"30a6ec7e1a9ad79c203d05a589c8b400\"",
    "Metadata": {}
}
```

- For API details, see HeadObject in *AWS CLI Command Reference*.

Java

### SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Determine the content type of an object.

```
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.HeadObjectRequest;
import software.amazon.awssdk.services.s3.model.HeadObjectResponse;
import software.amazon.awssdk.services.s3.model.S3Exception;

/**

Ruby

### SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
require "aws-sdk-s3"

# Wraps Amazon S3 object actions.
class ObjectExistsWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An Amazon S3 object.
  def initialize(object)
    @object = object
  end

  # Checks whether the object exists.
  #
  # @return [Boolean] True if the object exists; otherwise false.
  def exists?
    @object.exists?
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't check existence of object
 #{@object.bucket.name}:#{@object.key}. Here's why: #{e.message}"
    false
  end
end

# Example usage:
def run_demo
  bucket_name = "doc-example-bucket"
  object_key = "my-object.txt"

  wrapper = ObjectExistsWrapper.new(Aws::S3::Object.new(bucket_name, object_key))
  exists = wrapper.exists?

  puts "Object #{object_key} #{exists ? 'does' : 'does not'} exist."
```

```
end

run_demo if $PROGRAM_NAME == __FILE__
```

- For API details, see HeadObject in *AWS SDK for Ruby API Reference*.

## Use `ListBucketAnalyticsConfigurations` with an AWS SDK or CLI

The following code examples show how to use `ListBucketAnalyticsConfigurations`.

CLI

### AWS CLI

#### To retrieve a list of analytics configurations for a bucket

The following `list-bucket-analytics-configurations` retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \
    --bucket my-bucket
```

Output:

```
{
    "AnalyticsConfigurationList": [
        {
            "StorageClassAnalysis": {},
            "Id": "1"
        }
    ],
    "IsTruncated": false
}
```

- For API details, see ListBucketAnalyticsConfigurations in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command returns the first 100 analytics configurations of the given S3 bucket.**

```
Get-S3BucketAnalyticsConfigurationList -BucketName 's3casetestbucket'
```

- For API details, see ListBucketAnalyticsConfigurations in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `ListBucketInventoryConfigurations` with an AWS SDK or CLI

The following code examples show how to use `ListBucketInventoryConfigurations`.

CLI

**AWS CLI**

**To retrieve a list of inventory configurations for a bucket**

The following `list-bucket-inventory-configurations` example lists the inventory configurations for the specified bucket.

```
aws s3api list-bucket-inventory-configurations \
    --bucket my-bucket
```

Output:

```
{
    "InventoryConfigurationList": [
        {
            "IsEnabled": true,
            "Destination": {
                "S3BucketDestination": {
                    "Format": "ORC",
```

```
                    "Bucket": "arn:aws:s3:::my-bucket",
                    "AccountId": "123456789012"
                }
            },
            "IncludedObjectVersions": "Current",
            "Id": "1",
            "Schedule": {
                "Frequency": "Weekly"
            }
        },
        {
            "IsEnabled": true,
            "Destination": {
                "S3BucketDestination": {
                    "Format": "CSV",
                    "Bucket": "arn:aws:s3:::my-bucket",
                    "AccountId": "123456789012"
                }
            },
            "IncludedObjectVersions": "Current",
            "Id": "2",
            "Schedule": {
                "Frequency": "Daily"
            }
        }
    ],
    "IsTruncated": false
}
```

- For API details, see ListBucketInventoryConfigurations in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command returns the first 100 inventory configurations of the given S3 bucket.**

```
Get-S3BucketInventoryConfigurationList -BucketName 's3testbucket'
```

- For API details, see ListBucketInventoryConfigurations in *AWS Tools for PowerShell Cmdlet Reference*.

## Use `ListBuckets` with an AWS SDK or CLI

The following code examples show how to use `ListBuckets`.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
namespace ListBucketsExample
{
    using System;
    using System.Collections.Generic;
    using System.Threading.Tasks;
    using Amazon.S3;
    using Amazon.S3.Model;

    /// <summary>
    /// This example uses the AWS SDK for .NET to list the Amazon Simple Storage
    /// Service (Amazon S3) buckets belonging to the default account.
    /// </summary>
    public class ListBuckets
    {
        private static IAmazonS3 _s3Client;

        /// <summary>
        /// Get a list of the buckets owned by the default user.
        /// </summary>
        /// <param name="client">An initialized Amazon S3 client object.</param>
        /// <returns>The response from the ListingBuckets call that contains a
        /// list of the buckets owned by the default user.</returns>
        public static async Task<ListBucketsResponse> GetBuckets(IAmazonS3
 client)
```

```
        {
            return await client.ListBucketsAsync();
        }

        /// <summary>
        /// This method lists the name and creation date for the buckets in
        /// the passed List of S3 buckets.
        /// </summary>
        /// <param name="bucketList">A List of S3 bucket objects.</param>
        public static void DisplayBucketList(List<S3Bucket> bucketList)
        {
            bucketList
                .ForEach(b => Console.WriteLine($"Bucket name: {b.BucketName},
 created on: {b.CreationDate}"));
        }

        public static async Task Main()
        {
            // The client uses the AWS Region of the default user.
            // If the Region where the buckets were created is different,
            // pass the Region to the client constructor. For example:
            // _s3Client = new AmazonS3Client(RegionEndpoint.USEast1);
            _s3Client = new AmazonS3Client();
            var response = await GetBuckets(_s3Client);
            DisplayBucketList(response.Buckets);
        }
    }
}
```

- For API details, see ListBuckets in *AWS SDK for .NET API Reference*.

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::S3::listBuckets(const Aws::S3::S3ClientConfiguration &clientConfig)
 {
    Aws::S3::S3Client client(clientConfig);

    auto outcome = client.ListBuckets();

    bool result = true;
    if (!outcome.IsSuccess()) {
        std::cerr << "Failed with error: " << outcome.GetError() << std::endl;
        result = false;
    } else {
        std::cout << "Found " << outcome.GetResult().GetBuckets().size() << "
 buckets\n";
        for (auto &&b: outcome.GetResult().GetBuckets()) {
            std::cout << b.GetName() << std::endl;
        }
    }

    return result;
}
```

- For API details, see ListBuckets in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The following command uses the `list-buckets` command to display the names of all your Amazon S3 buckets (across all regions):

```
aws s3api list-buckets --query "Buckets[].Name"
```

The query option filters the output of `list-buckets` down to only the bucket names.

For more information about buckets, see Working with Amazon S3 Buckets in the *Amazon S3 Developer Guide*.

- For API details, see ListBuckets in *AWS CLI Command Reference*.

Go

**SDK for Go V2**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// BucketBasics encapsulates the Amazon Simple Storage Service (Amazon S3)
 actions
// used in the examples.
// It contains S3Client, an Amazon S3 service client that is used to perform
 bucket
// and object actions.
type BucketBasics struct {
 S3Client *s3.Client
}

// ListBuckets lists the buckets in the current account.
func (basics BucketBasics) ListBuckets() ([]types.Bucket, error) {
 result, err := basics.S3Client.ListBuckets(context.TODO(),
 &s3.ListBucketsInput{})
 var buckets []types.Bucket
 if err != nil {
  log.Printf("Couldn't list buckets for your account. Here's why: %v\n", err)
 } else {
  buckets = result.Buckets
 }
 return buckets, err
}
```

- For API details, see ListBuckets in *AWS SDK for Go API Reference*.

Java

### SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.Bucket;
import software.amazon.awssdk.services.s3.model.ListBucketsResponse;
import java.util.List;

/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-
started.html
 */
public class ListBuckets {
    public static void main(String[] args) {
        Region region = Region.US_EAST_1;
        S3Client s3 = S3Client.builder()
            .region(region)
            .build();

        listAllBuckets(s3);

    }
    public static void listAllBuckets(S3Client s3) {
        ListBucketsResponse response = s3.listBuckets();
        List<Bucket> bucketList = response.buckets();
        for (Bucket bucket: bucketList) {
            System.out.println("Bucket name "+bucket.name());
        }
    }
```

```
}
```

- For API details, see ListBuckets in *AWS SDK for Java 2.x API Reference*.

JavaScript

**SDK for JavaScript (v3)**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

List the buckets.

```
import { ListBucketsCommand, S3Client } from "@aws-sdk/client-s3";

const client = new S3Client({});

export const main = async () => {
  const command = new ListBucketsCommand({});

  try {
    const { Owner, Buckets } = await client.send(command);
    console.log(
      `${Owner.DisplayName} owns ${Buckets.length} bucket${
        Buckets.length === 1 ? "" : "s"
      }:`,
    );
    console.log(`${Buckets.map((b) => ` • ${b.Name}`).join("\n")}`);
  } catch (err) {
    console.error(err);
  }
};
```

- For more information, see AWS SDK for JavaScript Developer Guide.
- For API details, see ListBuckets in *AWS SDK for JavaScript API Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command returns all S3 buckets.**

```
Get-S3Bucket
```

**Example 2: This command returns bucket named "test-files"**

```
Get-S3Bucket -BucketName test-files
```

- For API details, see ListBuckets in *AWS Tools for PowerShell Cmdlet Reference*.

Python

**SDK for Python (Boto3)**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    @staticmethod
    def list(s3_resource):
        """
```

```
        Get the buckets in all Regions for the current account.

        :param s3_resource: A Boto3 S3 resource. This is a high-level resource in
 Boto3
                            that contains collections and factory methods to
 create
                            other high-level S3 sub-resources.
        :return: The list of buckets.
        """
        try:
            buckets = list(s3_resource.buckets.all())
            logger.info("Got buckets: %s.", buckets)
        except ClientError:
            logger.exception("Couldn't get buckets.")
            raise
        else:
            return buckets
```

- For API details, see ListBuckets in *AWS SDK for Python (Boto3) API Reference*.

Ruby

**SDK for Ruby**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
require "aws-sdk-s3"

# Wraps Amazon S3 resource actions.
class BucketListWrapper
  attr_reader :s3_resource

  # @param s3_resource [Aws::S3::Resource] An Amazon S3 resource.
  def initialize(s3_resource)
    @s3_resource = s3_resource
  end
```

```
  # Lists buckets for the current account.
  #
  # @param count [Integer] The maximum number of buckets to list.
  def list_buckets(count)
    puts "Found these buckets:"
    @s3_resource.buckets.each do |bucket|
      puts "\t#{bucket.name}"
      count -= 1
      break if count.zero?
    end
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't list buckets. Here's why: #{e.message}"
    false
  end
end

# Example usage:
def run_demo
  wrapper = BucketListWrapper.new(Aws::S3::Resource.new)
  wrapper.list_buckets(25)
end

run_demo if $PROGRAM_NAME == __FILE__
```

- For API details, see ListBuckets in *AWS SDK for Ruby API Reference*.

Rust

**SDK for Rust**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
async fn show_buckets(strict: bool, client: &Client, region: &str) -> Result<(),
 Error> {
    let resp = client.list_buckets().send().await?;
```

```
    let buckets = resp.buckets();
    let num_buckets = buckets.len();

    let mut in_region = 0;

    for bucket in buckets {
        if strict {
            let r = client
                .get_bucket_location()
                .bucket(bucket.name().unwrap_or_default())
                .send()
                .await?;

            if r.location_constraint().unwrap().as_ref() == region {
                println!("{}", bucket.name().unwrap_or_default());
                in_region += 1;
            }
        } else {
            println!("{}", bucket.name().unwrap_or_default());
        }
    }

    println!();
    if strict {
        println!(
            "Found {} buckets in the {} region out of a total of {} buckets.",
            in_region, region, num_buckets
        );
    } else {
        println!("Found {} buckets in all regions.", num_buckets);
    }

    Ok(())
}
```

- For API details, see ListBuckets in *AWS SDK for Rust API reference*.

Swift

**SDK for Swift**

> **Note**
>
> This is prerelease documentation for an SDK in preview release. It is subject to change.

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
/// Return an array containing information about every available bucket.
///
/// - Returns: An array of ``S3ClientTypes.Bucket`` objects describing
///   each bucket.
public func getAllBuckets() async throws -> [S3ClientTypes.Bucket] {
    let output = try await client.listBuckets(input: ListBucketsInput())

    guard let buckets = output.buckets else {
        return []
    }
    return buckets
}
```

- For API details, see ListBuckets in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `ListMultipartUploads` with an AWS SDK or CLI

The following code examples show how to use `ListMultipartUploads`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Delete incomplete multipart uploads

CLI

**AWS CLI**

The following command lists all of the active multipart uploads for a bucket named `my-bucket`:

```
aws s3api list-multipart-uploads --bucket my-bucket
```

Output:

```
{
    "Uploads": [
        {
            "Initiator": {
                "DisplayName": "username",
                "ID": "arn:aws:iam::0123456789012:user/username"
            },
            "Initiated": "2015-06-02T18:01:30.000Z",
            "UploadId":
 "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3
            "StorageClass": "STANDARD",
            "Key": "multipart/01",
            "Owner": {
                "DisplayName": "aws-account-name",
                "ID":
 "100719349fc3b6dcd7c820a124bf7aecd408092c3d7b51b38494939801fc248b"
            }
        }
    ],
    "CommonPrefixes": []
}
```

In progress multipart uploads incur storage costs in Amazon S3. Complete or abort an active multipart upload to remove its parts from your account.

- For API details, see ListMultipartUploads in *AWS CLI Command Reference*.

                    }
                }
                while (request != null);
            }
            catch (AmazonS3Exception ex)
            {
                Console.WriteLine($"Error: '{ex.Message}'");
            }
        }
    }
```

- For API details, see ListObjectVersions in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

The following command retrieves version information for an object in a bucket named `my-bucket`:

```
aws s3api list-object-versions --bucket my-bucket --prefix index.html
```

Output:

```
{
    "DeleteMarkers": [
        {
            "Owner": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd660687538875e7c86c5b672fe116bd438f46db45460ddcd036c32"
            },
            "IsLatest": true,
```

```
            "VersionId": "B2VsEK5saUNNHKcOAJj7hIE86RozToyq",
            "Key": "index.html",
            "LastModified": "2015-11-10T00:57:03.000Z"
        },
        {
            "Owner": {

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `ListObjects` with an AWS SDK or CLI

The following code examples show how to use `ListObjects`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Create a web page that lists Amazon S3 objects

CLI

**AWS CLI**

The following example uses the `list-objects` command to display the names of all the objects in the specified bucket:

```
aws s3api list-objects --bucket text-content --query 'Contents[].{Key: Key, Size:
 Size}'
```

The example uses the `--query` argument to filter the output of `list-objects` down to the key value and size for each object

For more information about objects, see Working with Amazon S3 Objects in the *Amazon S3 Developer Guide*.

- For API details, see ListObjects in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command retrieves the information about all of the items in the bucket "test-files".**

```
Get-S3Object -BucketName test-files
```

**Example 2: This command retrieves the information about the item "sample.txt" from bucket "test-files".**

```
Get-S3Object -BucketName test-files -Key sample.txt
```

**Example 3: This command retrieves the information about all items with the prefix "sample" from bucket "test-files".**

```
Get-S3Object -BucketName test-files -KeyPrefix sample
```

- For API details, see ListObjects in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `ListObjectsV2` with an AWS SDK or CLI

The following code examples show how to use `ListObjectsV2`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Get started with buckets and objects

List all of the objects in your bucket. If there is more than one object, IsTruncated and NextContinuationToken will be used to iterate over the full list.

```
import {
  S3Client,
  // This command supersedes the ListObjectsCommand and is the recommended way to
 list objects.
  ListObjectsV2Command,
} from "@aws-sdk/client-s3";

const client = new S3Client({});

export const main = async () => {
  const command = new ListObjectsV2Command({
    Bucket: "my-bucket",
    // The default and maximum number of keys returned is 1000. This limits it to
    // one for demonstration purposes.
    MaxKeys: 1,
  });
```

```
  try {
    let isTruncated = true;

    console.log("Your bucket contains the following objects:\n");
    let contents = "";

    while (isTruncated) {
      const { Contents, IsTruncated, NextContinuationToken } =
        await client.send(command);
      const contentsList = Contents.map((c) => ` • ${c.Key}`).join("\n");
      contents += contentsList + "\n";
      isTruncated = IsTruncated;
      command.input.ContinuationToken = NextContinuationToken;
    }
    console.log(contents);
  } catch (err) {
    console.error(err);
  }
};
```

- For API details, see ListObjectsV2 in *AWS SDK for JavaScript API Reference*.

## Use `PutBucketAccelerateConfiguration` with an AWS SDK or CLI

The following code examples show how to use `PutBucketAccelerateConfiguration`.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
using System;
using System.Threading.Tasks;
using Amazon.S3;
using Amazon.S3.Model;

/// <summary>
/// Amazon Simple Storage Service (Amazon S3) Transfer Acceleration is a
/// bucket-level feature that enables you to perform faster data transfers
/// to Amazon S3. This example shows how to configure Transfer
/// Acceleration.
/// </summary>
public class TransferAcceleration
{
    /// <summary>
    /// The main method initializes the client object and sets the
    /// Amazon Simple Storage Service (Amazon S3) bucket name before
    /// calling EnableAccelerationAsync.
    /// </summary>
    public static async Task Main()
    {
        var s3Client = new AmazonS3Client();
```

```
            const string bucketName = "doc-example-bucket";

            await EnableAccelerationAsync(s3Client, bucketName);
        }

        /// <summary>
        /// This method sets the configuration to enable transfer acceleration
        /// for the bucket referred to in the bucketName parameter.
        /// </summary>
        /// <param name="client">An Amazon S3 client used to enable the
        /// acceleration on an Amazon S3 bucket.</param>
        /// <param name="bucketName">The name of the Amazon S3 bucket for which
the
        /// method will be enabling acceleration.</param>
        private static async Task EnableAccelerationAsync(AmazonS3Client client,
string bucketName)
        {
            try
            {
                var putRequest = new PutBucketAccelerateConfigurationRequest
                {
                    BucketName = bucketName,
                    AccelerateConfiguration = new AccelerateConfiguration
                    {
                        Status = BucketAccelerateStatus.Enabled,
                    },
                };
                await client.PutBucketAccelerateConfigurationAsync(putRequest);

                var getRequest = new GetBucketAccelerateConfigurationRequest
                {
                    BucketName = bucketName,
                };
                var response = await
client.GetBucketAccelerateConfigurationAsync(getRequest);

                Console.WriteLine($"Acceleration state = '{response.Status}' ");
            }
            catch (AmazonS3Exception ex)
            {
                Console.WriteLine($"Error occurred. Message:'{ex.Message}' when
setting transfer acceleration");
            }
        }
```

```
    }
```

- For API details, see PutBucketAccelerateConfiguration in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

**To set the accelerate configuration of a bucket**

The following `put-bucket-accelerate-configuration` example enables the accelerate configuration for the specified bucket.

```
aws s3api put-bucket-accelerate-configuration \
    --bucket my-bucket \
    --accelerate-configuration Status=Enabled
```

This command produces no output.

- For API details, see PutBucketAccelerateConfiguration in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command enables the transfer acceleration for the given S3 bucket.**

```
$statusVal = New-Object Amazon.S3.BucketAccelerateStatus('Enabled')
Write-S3BucketAccelerateConfiguration -BucketName 's3testbucket' -
AccelerateConfiguration_Status $statusVal
```

- For API details, see PutBucketAccelerateConfiguration in *AWS Tools for PowerShell Cmdlet Reference*.

# Use `PutBucketAcl` with an AWS SDK or CLI

The following code examples show how to use `PutBucketAcl`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage access control lists (ACLs)

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        /// <summary>
        /// Creates an Amazon S3 bucket with an ACL to control access to the
        /// bucket and the objects stored in it.
        /// </summary>
        /// <param name="client">The initialized client object used to create
        /// an Amazon S3 bucket, with an ACL applied to the bucket.
        /// </param>
        /// <param name="region">The AWS Region where the bucket will be
created.</param>
        /// <param name="newBucketName">The name of the bucket to create.</param>
        /// <returns>A boolean value indicating success or failure.</returns>
        public static async Task<bool> CreateBucketUseCannedACLAsync(IAmazonS3
client, S3Region region, string newBucketName)
        {
            try
            {
                // Create a new Amazon S3 bucket with Canned ACL.
                var putBucketRequest = new PutBucketRequest()
                {
                    BucketName = newBucketName,
                    BucketRegion = region,
```

```
                    CannedACL = S3CannedACL.LogDeliveryWrite,
                };

                PutBucketResponse putBucketResponse = await
client.PutBucketAsync(putBucketRequest);

                return putBucketResponse.HttpStatusCode ==
System.Net.HttpStatusCode.OK;
            }
            catch (AmazonS3Exception ex)
            {
                Console.WriteLine($"Amazon S3 error: {ex.Message}");
            }

            return false;
        }
```

- For API details, see PutBucketAcl in *AWS SDK for .NET API Reference*.

```

- For API details, see PutBucketAcl in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

This example grants `full control` to two AWS users (*user1@example.com* and *user2@example.com*) and `read` permission to everyone:

```
aws s3api put-bucket-acl --bucket MyBucket --grant-full-
control emailaddress=user1@example.com,emailaddress=user2@example.com --grant-
read uri=http://acs.amazonaws.com/groups/global/AllUsers
```

See http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html for details on custom ACLs (the s3api ACL commands, such as `put-bucket-acl`, use the same shorthand argument notation).

- For API details, see PutBucketAcl in *AWS CLI Command Reference*.

Put the bucket ACL.

```
import { PutBucketAclCommand, S3Client } from "@aws-sdk/client-s3";
```

```
const client = new S3Client({});

// Most Amazon S3 use cases don't require the use of access control lists (ACLs).
// We recommend that you disable ACLs, except in unusual circumstances where
// you need to control access for each object individually.
// Consider a policy instead. For more information see https://
docs.aws.amazon.com/AmazonS3/latest/userguide/bucket-policies.html.
export const main = async () => {
  // Grant a user READ access to a bucket.
  const command = new PutBucketAclCommand({
    Bucket: "test-bucket",
    AccessControlPolicy: {
      Grants: [
        {
          Grantee: {
            // The canonical ID of the user. This ID is an obfuscated form of
 your AWS account number.
            // It's unique to Amazon S3 and can't be found elsewhere.
            // For more information, see https://docs.aws.amazon.com/AmazonS3/
latest/userguide/finding-canonical-user-id.html.
            ID: "canonical-id-1",
            Type: "CanonicalUser",
          },
          // One of FULL_CONTROL | READ | WRITE | READ_ACP | WRITE_ACP
          // https://docs.aws.amazon.com/AmazonS3/latest/API/
API_Grant.html#AmazonS3-Type-Grant-Permission
          Permission: "FULL_CONTROL",
        },
      ],
      Owner: {
        ID: "canonical-id-2",
      },
    },
  });

  try {
    const response = await client.send(command);
    console.log(response);
  } catch (err) {
    console.error(err);
  }
};
```

## Use `PutBucketCors` with an AWS SDK or CLI

The following code examples show how to use `PutBucketCors`.

.NET

### AWS SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        /// <summary>
        /// Add CORS configuration to the Amazon S3 bucket.
        /// </summary>
        /// <param name="client">The initialized Amazon S3 client object used
        /// to apply the CORS configuration to an Amazon S3 bucket.</param>
        /// <param name="configuration">The CORS configuration to apply.</param>
        private static async Task PutCORSConfigurationAsync(AmazonS3Client
client, CORSConfiguration configuration)
        {
            PutCORSConfigurationRequest request = new
PutCORSConfigurationRequest()
            {
                BucketName = BucketName,
                Configuration = configuration,
            };

            _ = await client.PutCORSConfigurationAsync(request);
        }
```

- For API details, see PutBucketCors in *AWS SDK for .NET API Reference*.

CLI

### AWS CLI

The following example enables PUT, POST, and DELETE requests from *www.example.com*, and enables GET requests from any domain:

```
aws s3api put-bucket-cors --bucket MyBucket --cors-configuration file://cors.json

cors.json:
{
  "CORSRules": [
    {
      "AllowedOrigins": ["http://www.example.com"],
      "AllowedHeaders": ["*"],
      "AllowedMethods": ["PUT", "POST", "DELETE"],
      "MaxAgeSeconds": 3000,
      "ExposeHeaders": ["x-amz-server-side-encryption"]
    },
    {
      "AllowedOrigins": ["*"],
      "AllowedHeaders": ["Authorization"],
      "AllowedMethods": ["GET"],
      "MaxAgeSeconds": 3000
    }
  ]
}
```

- For API details, see PutBucketCors in *AWS CLI Command Reference*.

> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Add a CORS rule.

```
import { PutBucketCorsCommand, S3Client } from "@aws-sdk/client-s3";

const client = new S3Client({});

// By default, Amazon S3 doesn't allow cross-origin requests. Use this command
// to explicitly allow cross-origin requests.
export const main = async () => {
  const command = new PutBucketCorsCommand({
    Bucket: "test-bucket",
    CORSConfiguration: {
      CORSRules: [
        {
          // Allow all headers to be sent to this bucket.
          AllowedHeaders: ["*"],
          // Allow only GET and PUT methods to be sent to this bucket.
          AllowedMethods: ["GET", "PUT"],
          // Allow only requests from the specified origin.
          AllowedOrigins: ["https://www.example.com"],
          // Allow the entity tag (ETag) header to be returned in the response.
 The ETag header
          // The entity tag represents a specific version of the object. The ETag
 reflects
          // changes only to the contents of an object, not its metadata.
          ExposeHeaders: ["ETag"],
          // How long the requesting browser should cache the preflight response.
 After
          // this time, the preflight request will have to be made again.
          MaxAgeSeconds: 3600,
        },
      ],
    },
```

```
  });

  try {
    const response = await client.send(command);
    console.log(response);
  } catch (err) {
    console.error(err);
  }
};
```

Ruby

**SDK for Ruby**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
require "aws-sdk-s3"

# Wraps Amazon S3 bucket CORS configuration.
class BucketCorsWrapper
  attr_reader :bucket_cors

  # @param bucket_cors [Aws::S3::BucketCors] A bucket CORS object configured with
 an existing bucket.
  def initialize(bucket_cors)
    @bucket_cors = bucket_cors
  end

  # Sets CORS rules on a bucket.
```

```
  #
  # @param allowed_methods [Array<String>] The types of HTTP requests to allow.
  # @param allowed_origins [Array<String>] The origins to allow.
  # @returns [Boolean] True if the CORS rules were set; otherwise, false.
  def set_cors(allowed_methods, allowed_origins)
    @bucket_cors.put(
      cors_configuration: {
        cors_rules: [
          {
            allowed_methods: allowed_methods,
            allowed_origins: allowed_origins,
            allowed_headers: %w[*],
            max_age_seconds: 3600
          }
        ]
      }
    )
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't set CORS rules for #{@bucket_cors.bucket.name}. Here's why:
 #{e.message}"
    false
  end

end
```

- For API details, see PutBucketCors in *AWS SDK for Ruby API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `PutBucketEncryption` with an AWS SDK or CLI

The following code examples show how to use `PutBucketEncryption`.

CLI

### AWS CLI

#### To configure server-side encryption for a bucket

The following `put-bucket-encryption` example sets AES256 encryption as the default for the specified bucket.

```
aws s3api put-bucket-encryption \
    --bucket my-bucket \
    --server-side-encryption-configuration '{"Rules":
 [{"ApplyServerSideEncryptionByDefault": {"SSEAlgorithm": "AES256"}}]}'
```

This command produces no output.

- For API details, see PutBucketEncryption in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command enables default AES256 server side encryption with Amazon S3 Managed Keys(SSE-S3) on the given bucket.**

```
$Encryptionconfig = @{ServerSideEncryptionByDefault =
 @{ServerSideEncryptionAlgorithm = "AES256"}}
Set-S3BucketEncryption -BucketName 's3testbucket' -
ServerSideEncryptionConfiguration_ServerSideEncryptionRule $Encryptionconfig
```

- For API details, see PutBucketEncryption in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `PutBucketLifecycleConfiguration` with an AWS SDK or CLI

The following code examples show how to use `PutBucketLifecycleConfiguration`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Delete incomplete multipart uploads
- Work with versioned objects

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        /// <summary>
        /// Adds lifecycle configuration information to the S3 bucket named in
        /// the bucketName parameter.
        /// </summary>
        /// <param name="client">The S3 client used to call the
        /// PutLifecycleConfigurationAsync method.</param>
        /// <param name="bucketName">A string representing the S3 bucket to
        /// which configuration information will be added.</param>
        /// <param name="configuration">A LifecycleConfiguration object that
        /// will be applied to the S3 bucket.</param>
        public static async Task AddExampleLifecycleConfigAsync(IAmazonS3 client,
string bucketName, LifecycleConfiguration configuration)
        {
            var request = new PutLifecycleConfigurationRequest()
            {
                BucketName = bucketName,
                Configuration = configuration,
            };
            var response = await client.PutLifecycleConfigurationAsync(request);
        }
```

- For API details, see PutBucketLifecycleConfiguration in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

The following command applies a lifecycle configuration to a bucket named `my-bucket`:

```
aws s3api put-bucket-lifecycle-configuration --bucket my-bucket --lifecycle-
configuration  file://lifecycle.json
```

The file `lifecycle.json` is a JSON document in the current folder that specifies two rules:

```
{
    "Rules": [
        {
            "ID": "Move rotated logs to Glacier",
            "Prefix": "rotated/",
            "Status": "Enabled",
            "Transitions": [
                {
                    "Date": "2015-11-10T00:00:00.000Z",
                    "StorageClass": "GLACIER"
                }
            ]
        },
        {
            "Status": "Enabled",
            "Prefix": "",
            "NoncurrentVersionTransitions": [
                {
                    "NoncurrentDays": 2,
                    "StorageClass": "GLACIER"
                }
            ],
            "ID": "Move old versions to Glacier"
        }
    ]
}
```

The first rule moves files with the prefix `rotated` to Glacier on the specified date. The second rule moves old object versions to Glacier when they are no longer current. For information on acceptable timestamp formats, see Specifying Parameter Values in the *AWS CLI User Guide*.

- For API details, see PutBucketLifecycleConfiguration in *AWS CLI Command Reference*.

## Use `PutBucketLogging` with an AWS SDK or CLI

The following code examples show how to use `PutBucketLogging`.

.NET

### AWS SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
using System;
using System.IO;
using System.Threading.Tasks;
using Amazon.S3;
using Amazon.S3.Model;
using Microsoft.Extensions.Configuration;

/// <summary>
/// This example shows how to enable logging on an Amazon Simple Storage
/// Service (Amazon S3) bucket. You need to have two Amazon S3 buckets for
/// this example. The first is the bucket for which you wish to enable
/// logging, and the second is the location where you want to store the
/// logs.
/// </summary>
public class ServerAccessLogging
{
    private static IConfiguration _configuration = null!;

    public static async Task Main()
    {
        LoadConfig();

        string bucketName = _configuration["BucketName"];
        string logBucketName = _configuration["LogBucketName"];
        string logObjectKeyPrefix = _configuration["LogObjectKeyPrefix"];
        string accountId = _configuration["AccountId"];

        // If the AWS Region defined for your default user is different
        // from the Region where your Amazon S3 bucket is located,
        // pass the Region name to the Amazon S3 client object's constructor.
        // For example: RegionEndpoint.USWest2 or RegionEndpoint.USEast2.
        IAmazonS3 client = new AmazonS3Client();
```

```
            try
            {
                // Update bucket policy for target bucket to allow delivery of
logs to it.
                await SetBucketPolicyToAllowLogDelivery(

        /// object key.</param>
        /// <returns>Async task.</returns>
        public static async Task EnableLoggingAsync(
            IAmazonS3 client,
            string bucketName,
            string logBucketName,
            string logObjectKeyPrefix)
        {
            Console.WriteLine($"Enabling logging for bucket {bucketName}.");
            var loggingConfig = new S3BucketLoggingConfig
            {
                TargetBucketName = logBucketName,
                TargetPrefix = logObjectKeyPrefix,
            };

            var putBucketLoggingRequest = new PutBucketLoggingRequest
            {
                BucketName = bucketName,
                LoggingConfig = loggingConfig,
            };
            await client.PutBucketLoggingAsync(putBucketLoggingRequest);
            Console.WriteLine($"Logging enabled.");
        }

        /// <summary>
        /// Loads configuration from settings files.
        /// </summary>
        public static void LoadConfig()
        {
            _configuration = new ConfigurationBuilder()
                .SetBasePath(Directory.GetCurrentDirectory())
                .AddJsonFile("settings.json") // Load settings from .json file.
                .AddJsonFile("settings.local.json", true) // Optionally, load
 local settings.
                .Build();
```

```
        }
    }
```

- For API details, see PutBucketLogging in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

**Example 1: To set bucket policy logging**

The following `put-bucket-logging` example sets the logging policy for *MyBucket*. First, grant the logging service principal permission in your bucket policy using the `put-bucket-policy` command.

```
aws s3api put-bucket-policy \
    --bucket MyBucket \
    --policy file://policy.json
```

Contents of `policy.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "S3ServerAccessLogsPolicy",
            "Effect": "Allow",
            "Principal": {"Service": "logging.s3.amazonaws.com"},
            "Action": "s3:PutObject",
            "Resource": "arn:aws:s3:::MyBucket/Logs/*",
            "Condition": {
                "ArnLike": {"aws:SourceARN": "arn:aws:s3:::SOURCE-BUCKET-NAME"},
                "StringEquals": {"aws:SourceAccount": "SOURCE-AWS-ACCOUNT-ID"}
            }
        }
    ]
}
```

To apply the logging policy, use `put-bucket-logging`.

```
aws s3api put-bucket-logging \
    --bucket MyBucket \
    --bucket-logging-status file://logging.json
```

Contents of `logging.json`:

```
{
     "LoggingEnabled": {
         "TargetBucket": "MyBucket",
         "TargetPrefix": "Logs/"
     }
 }
```

The `put-bucket-policy` command is required to grant `s3:PutObject` permissions to the logging service principal.

For more information, see Amazon S3 Server Access Logging in the *Amazon S3 User Guide*.

**Example 2: To set a bucket policy for logging access to only a single user**

The following `put-bucket-logging` example sets the logging policy for *MyBucket*. The AWS user *bob@example.com* will have full control over the log files, and no one else has any access. First, grant S3 permission with `put-bucket-acl`.

```
aws s3api put-bucket-acl \
    --bucket MyBucket \
    --grant-write URI=http://acs.amazonaws.com/groups/s3/LogDelivery \
    --grant-read-acp URI=http://acs.amazonaws.com/groups/s3/LogDelivery
```

Then apply the logging policy using `put-bucket-logging`.

```
aws s3api put-bucket-logging \
    --bucket MyBucket \
    --bucket-logging-status file://logging.json
```

Contents of `logging.json`:

```
{
    "LoggingEnabled": {
```

```
        "TargetBucket": "MyBucket",
        "TargetPrefix": "MyBucketLogs/",
        "TargetGrants": [
            {
                "Grantee": {
                    "Type": "AmazonCustomerByEmail",
                    "EmailAddress": "bob@example.com"
                },
                "Permission": "FULL_CONTROL"
            }
        ]
    }
}
```

the `put-bucket-acl` command is required to grant S3's log delivery system the necessary permissions (write and read-acp permissions).

For more information, see Amazon S3 Server Access Logging in the *Amazon S3 Developer Guide*.

- For API details, see PutBucketLogging in *AWS CLI Command Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `PutBucketNotification` with an AWS SDK or CLI

The following code examples show how to use `PutBucketNotification`.

CLI

### AWS CLI

The applies a notification configuration to a bucket named `my-bucket`:

```
aws s3api put-bucket-notification --bucket my-bucket --notification-
configuration file://notification.json
```

The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor:

```
{
  "TopicConfiguration": {
    "Event": "s3:ObjectCreated:*",
    "Topic": "arn:aws:sns:us-west-2:123456789012:s3-notification-topic"
  }
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it:

```
{
 "Version": "2008-10-17",
 "Id": "example-ID",
 "Statement": [
  {
   "Sid": "example-statement-ID",
   "Effect": "Allow",
   "Principal": {
     "Service": "s3.amazonaws.com"
   },
   "Action": [
    "SNS:Publish"
   ],
   "Resource": "arn:aws:sns:us-west-2:123456789012:my-bucket",
   "Condition": {
      "ArnLike": {
      "aws:SourceArn": "arn:aws:s3:*:*:my-bucket"
    }
   }
  }
 ]
}
```

- For API details, see PutBucketNotification in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This example configures the SNS topic configuration for the S3 event ObjectRemovedDelete and enables notification for the given s3 bucket**

```
$topic =  [Amazon.S3.Model.TopicConfiguration] @{
```

```
  Id = "delete-event"
  Topic = "arn:aws:sns:eu-west-1:123456789012:topic-1"
  Event = [Amazon.S3.EventType]::ObjectRemovedDelete
}

Write-S3BucketNotification -BucketName kt-tools -TopicConfiguration $topic
```

**Example 2: This example enables notifications of ObjectCreatedAll for the given bucket sending it to Lambda function.**

```
$lambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
  Events = "s3:ObjectCreated:*"
  FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:rdplock"
  Id = "ObjectCreated-Lambda"
  Filter = @{
    S3KeyFilter = @{
      FilterRules = @(
        @{Name="Prefix";Value="dada"}
        @{Name="Suffix";Value=".pem"}
      )
    }
  }
}

Write-S3BucketNotification -BucketName ssm-editor -LambdaFunctionConfiguration
 $lambdaConfig
```

**Example 3: This example creates 2 different Lambda configuration on the basis of different key-suffix and configured both in a single command.**

```
#Lambda Config 1

$firstLambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
  Events = "s3:ObjectCreated:*"
  FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:verifynet"
  Id = "ObjectCreated-dada-ps1"
  Filter = @{
    S3KeyFilter = @{
      FilterRules = @(
        @{Name="Prefix";Value="dada"}
        @{Name="Suffix";Value=".ps1"}
      )
```

```
    }
  }
}

#Lambda Config 2

$secondlambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
  Events = [Amazon.S3.EventType]::ObjectCreatedAll
  FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:verifyssm"
  Id = "ObjectCreated-dada-json"
  Filter = @{
    S3KeyFilter = @{
      FilterRules = @(
        @{Name="Prefix";Value="dada"}
        @{Name="Suffix";Value=".json"}
      )
    }
  }
}

Write-S3BucketNotification -BucketName ssm-editor -LambdaFunctionConfiguration
 $firstLambdaConfig,$secondlambdaConfig
```

- For API details, see PutBucketNotification in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `PutBucketNotificationConfiguration` with an AWS SDK or CLI

The following code examples show how to use `PutBucketNotificationConfiguration`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Process S3 event notifications
- Send event notifications to EventBridge

.NET

### AWS SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    using System;
    using System.Collections.Generic;
    using System.Threading.Tasks;
    using Amazon.S3;
    using Amazon.S3.Model;

    /// <summary>
    /// This example shows how to enable notifications for an Amazon Simple
    /// Storage Service (Amazon S3) bucket.
    /// </summary>
    public class EnableNotifications
    {
        public static async Task Main()
        {
            const string bucketName = "doc-example-bucket1";
            const string snsTopic = "arn:aws:sns:us-east-2:0123456789ab:bucket-
notify";
            const string sqsQueue = "arn:aws:sqs:us-
east-2:0123456789ab:Example_Queue";

            IAmazonS3 client = new AmazonS3Client(Amazon.RegionEndpoint.USEast2);

        /// Service (Amazon SNS) topic associated with the S3 bucket.</param>
        /// <param name="sqsQueue">The ARN of the Amazon Simple Queue Service
        /// (Amazon SQS) queue to which notifications will be pushed.</param>
        public static async Task EnableNotificationAsync(
            IAmazonS3 client,
            string bucketName,
            string snsTopic,
            string sqsQueue)
        {
            try
            {
                // The bucket for which we are setting up notifications.
                var request = new PutBucketNotificationRequest()
                {
                    BucketName = bucketName,
                };

                // Defines the topic to use when sending a notification.
                var topicConfig = new TopicConfiguration()
                {
                    Events = new List<EventType> { EventType.ObjectCreatedCopy },
                    Topic = snsTopic,
                };
                request.TopicConfigurations = new List<TopicConfiguration>
                {
                    topicConfig,
                };
                request.QueueConfigurations = new List<QueueConfiguration>
                {
                    new QueueConfiguration()
                    {
                        Events = new List<EventType>
{ EventType.ObjectCreatedPut },
                        Queue = sqsQueue,
                    },
                };

                // Now apply the notification settings to the bucket.
                PutBucketNotificationResponse response = await
client.PutBucketNotificationAsync(request);
            }
            catch (AmazonS3Exception ex)
            {
```

```
                Console.WriteLine($"Error: {ex.Message}");
            }
        }
    }
```

- For API details, see PutBucketNotificationConfiguration in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

**To enable the specified notifications to a bucket**

The following `put-bucket-notification-configuration` example applies a notification configuration to a bucket named `my-bucket`. The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor.

```
aws s3api put-bucket-notification-configuration \
    --bucket my-bucket \
    --notification-configuration file://notification.json
```

Contents of `notification.json`:

```
{
    "TopicConfigurations": [
        {
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:s3-notification-
topic",
            "Events": [
                "s3:ObjectCreated:*"
            ]
        }
    ]
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it.

```
{
```

```
    "Version": "2008-10-17",
    "Id": "example-ID",
    "Statement": [
        {
            "Sid": "example-statement-ID",
            "Effect": "Allow",
            "Principal": {
                "Service": "s3.amazonaws.com"
            },
            "Action": [
                "SNS:Publish"
            ],
            "Resource": "arn:aws:sns:us-west-2:123456789012::s3-notification-
topic",
            "Condition": {
                "ArnLike": {
                    "aws:SourceArn": "arn:aws:s3:*:*:my-bucket"
                }
            }
        }
    ]
}
```

- For API details, see PutBucketNotificationConfiguration in *AWS CLI Command Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `PutBucketPolicy` with an AWS SDK or CLI

The following code examples show how to use `PutBucketPolicy`.

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::S3::putBucketPolicy(const Aws::String &bucketName,
                                 const Aws::String &policyBody,
                                 const Aws::S3::S3ClientConfiguration
 &clientConfig) {
    Aws::S3::S3Client s3Client(clientConfig);

    std::shared_ptr<Aws::StringStream> request_body =
            Aws::MakeShared<Aws::StringStream>("");
    *request_body << policyBody;

    Aws::S3::Model::PutBucketPolicyRequest request;
    request.SetBucket(bucketName);
    request.SetBody(request_body);

    Aws::S3::Model::PutBucketPolicyOutcome outcome =
            s3Client.PutBucketPolicy(request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Error: putBucketPolicy: "
                  << outcome.GetError().GetMessage() << std::endl;
    } else {
        std::cout << "Set the following policy body for the bucket '" <<
                  bucketName << "':" << std::endl << std::endl;
        std::cout << policyBody << std::endl;
    }

    return outcome.IsSuccess();
}

//! Build a policy JSON string.
/*!
  \param userArn: Aws user Amazon Resource Name (ARN).
      For more information, see https://docs.aws.amazon.com/IAM/latest/UserGuide/
reference_identifiers.html#identifiers-arns.
  \param bucketName: Name of a bucket.
  \return String: Policy as JSON string.
*/

Aws::String getPolicyString(const Aws::String &userArn,
                            const Aws::String &bucketName) {
    return
            "{\n"
```

```
            "   \"Version\":\"2012-10-17\",\n"
            "   \"Statement\":[\n"
            "       {\n"
            "           \"Sid\": \"1\",\n"
            "           \"Effect\": \"Allow\",\n"
            "           \"Principal\": {\n"
            "               \"AWS\": \""
            + userArn +
            "\"\n""           },\n"
            "           \"Action\": [ \"s3:getObject\" ],\n"
            "           \"Resource\": [ \"arn:aws:s3:::"
            + bucketName +
            "/*\" ]\n"
            "       }\n"
            "   ]\n"
            "}";
}
```

- For API details, see PutBucketPolicy in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

This example allows all users to retrieve any object in *MyBucket* except those in the *MySecretFolder*. It also grants `put` and `delete` permission to the root user of the AWS account `1234-5678-9012`:

```
aws s3api put-bucket-policy --bucket MyBucket --policy file://policy.json

policy.json:
{
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": "*",
         "Action": "s3:GetObject",
         "Resource": "arn:aws:s3:::MyBucket/*"
      },
      {
         "Effect": "Deny",
```

```
            "Principal": "*",
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:::MyBucket/MySecretFolder/*"
        },
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:root"
            },
            "Action": [
                "s3:DeleteObject",
                "s3:PutObject"
            ],
            "Resource": "arn:aws:s3:::MyBucket/*"
        }

    ]
}
```

- For API details, see PutBucketPolicy in *AWS CLI Command Reference*.

Java

**SDK for Java 2.x**

> **Note**
>

```
# Wraps an Amazon S3 bucket policy.
class BucketPolicyWrapper
  attr_reader :bucket_policy

  # @param bucket_policy [Aws::S3::BucketPolicy] A bucket policy object
 configured with an existing bucket.
  def initialize(bucket_policy)
    @bucket_policy = bucket_policy
  end

  # Sets a policy on a bucket.
  #
  def set_policy(policy)
    @bucket_policy.put(policy: policy)
```

```
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't set the policy for #{@bucket_policy.bucket.name}. Here's why:
 #{e.message}"
    false
  end

end
```

- For API details, see PutBucketPolicy in *AWS SDK for Ruby API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `PutBucketReplication` with an AWS SDK or CLI

The following code examples show how to use `PutBucketReplication`.

CLI

### AWS CLI

#### To configure replication for an S3 bucket

The following `put-bucket-replication` example applies a replication configuration to the specified S3 bucket.

```
aws s3api put-bucket-replication \
    --bucket AWSDOC-EXAMPLE-BUCKET1 \
    --replication-configuration file://replication.json
```

Contents of `replication.json`:

```
{
    "Role": "arn:aws:iam::123456789012:role/s3-replication-role",
    "Rules": [
        {
            "Status": "Enabled",
            "Priority": 1,
```

```
            "DeleteMarkerReplication": { "Status": "Disabled" },
            "Filter" : { "Prefix": ""},
            "Destination": {
                "Bucket": "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET2"
            }
        }
    ]
}
```

The destination bucket must have versioning enabled. The specified role must have permission to write to the destination bucket and have a trust relationship that allows Amazon S3 to assume the role.

Example role permission policy:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetReplicationConfiguration",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET1"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObjectVersion",
                "s3:GetObjectVersionAcl",
                "s3:GetObjectVersionTagging"
            ],
            "Resource": [
                "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET1/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:ReplicateObject",
```

```
                "s3:ReplicateDelete",
                "s3:ReplicateTags"
            ],
            "Resource": "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET2/*"
        }
    ]
}
```

Example trust relationship policy:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "s3.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

This command produces no output.

For more information, see This is the topic title in the *Amazon Simple Storage Service Console User Guide*.

- For API details, see PutBucketReplication in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This example sets a replication configuration with a single rule enabling replication to the 'exampletargetbucket' bucket any new objects created with the key name prefix "TaxDocs" in the bucket 'examplebucket'.**

```
$rule1 = New-Object Amazon.S3.Model.ReplicationRule
$rule1.ID = "Rule-1"
$rule1.Status = "Enabled"
$rule1.Prefix = "TaxDocs"
```

```
$rule1.Destination = @{ BucketArn = "arn:aws:s3:::exampletargetbucket" }

$params = @{
    BucketName = "examplebucket"
    Configuration_Role = "arn:aws:iam::35667example:role/
CrossRegionReplicationRoleForS3"
    Configuration_Rule = $rule1
}

Write-S3BucketReplication @params
```

**Example 2: This example sets a replication configuration with multiple rules enabling replication to the 'exampletargetbucket' bucket any new objects created with either the key name prefix "TaxDocs" or "OtherDocs". The key prefixes must not overlap.**

```
$rule1 = New-Object Amazon.S3.Model.ReplicationRule
$rule1.ID = "Rule-1"
$rule1.Status = "Enabled"
$rule1.Prefix = "TaxDocs"
$rule1.Destination = @{ BucketArn = "arn:aws:s3:::exampletargetbucket" }

$rule2 = New-Object Amazon.S3.Model.ReplicationRule
$rule2.ID = "Rule-2"
$rule2.Status = "Enabled"
$rule2.Prefix = "OtherDocs"
$rule2.Destination = @{ BucketArn = "arn:aws:s3:::exampletargetbucket" }

$params = @{
    BucketName = "examplebucket"
    Configuration_Role = "arn:aws:iam::35667example:role/
CrossRegionReplicationRoleForS3"
    Configuration_Rule = $rule1,$rule2
}

Write-S3BucketReplication @params
```

**Example 3: This example updates the replication configuration on the specified bucket to disable the rule controlling replication of objects with the key name prefix "TaxDocs" to the bucket 'exampletargetbucket'.**

```
$rule1 = New-Object Amazon.S3.Model.ReplicationRule
$rule1.ID = "Rule-1"
```

```
$rule1.Status = "Disabled"
$rule1.Prefix = "TaxDocs"
$rule1.Destination = @{ BucketArn = "arn:aws:s3:::exampletargetbucket" }

$params = @{
    BucketName = "examplebucket"
    Configuration_Role = "arn:aws:iam::35667example:role/
CrossRegionReplicationRoleForS3"
    Configuration_Rule = $rule1
}

Write-S3BucketReplication @params
```

- For API details, see PutBucketReplication in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `PutBucketRequestPayment` with an AWS SDK or CLI

The following code examples show how to use `PutBucketRequestPayment`.

CLI

### AWS CLI

#### Example 1: To enable ``requester pays`` configuration for a bucket

The following `put-bucket-request-payment` example enables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \
    --bucket my-bucket \
    --request-payment-configuration '{"Payer":"Requester"}'
```

This command produces no output.

#### Example 2: To disable ``requester pays`` configuration for a bucket

The following `put-bucket-request-payment` example disables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \
    --bucket my-bucket \
    --request-payment-configuration '{"Payer":"BucketOwner"}'
```

This command produces no output.

- For API details, see PutBucketRequestPayment in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: Updates the request payment configuration for the bucket named 'mybucket' so that the person requesting downloads from the bucket will be charged for the download. By default the bucket owner pays for downloads. To set the request payment back to the default use 'BucketOwner' for the RequestPaymentConfiguration_Payer parameter.**

```
Write-S3BucketRequestPayment -BucketName mybucket -
RequestPaymentConfiguration_Payer Requester
```

- For API details, see PutBucketRequestPayment in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use PutBucketTagging with an AWS SDK or CLI

The following code examples show how to use `PutBucketTagging`.

CLI

**AWS CLI**

The following command applies a tagging configuration to a bucket named `my-bucket`:

```
aws s3api put-bucket-tagging --bucket my-bucket --tagging file://tagging.json
```

The file `tagging.json` is a JSON document in the current folder that specifies tags:

```
{
   "TagSet": [
     {
       "Key": "organization",
       "Value": "marketing"
     }
   ]
}
```

Or apply a tagging configuration to `my-bucket` directly from the command line:

```
aws s3api put-bucket-tagging --bucket my-bucket --tagging
 'TagSet=[{Key=organization,Value=marketing}]'
```

- For API details, see PutBucketTagging in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell**

**Example 1: This command applies two tags to a bucket named `cloudtrail-test-2018`: a tag with a key of Stage and a value of Test, and a tag with a key of Environment and a value of Alpha. To verify that the tags were added to the bucket, run `Get-S3BucketTagging -BucketName bucket_name`. The results should show the tags that you applied to the bucket in the first command. Note that `Write-S3BucketTagging` overwrites the entire existing tag set on a bucket. To add or delete individual tags, run the Resource Groups and Tagging API cmdlets, `Add-RGTResourceTag` and `Remove-RGTResourceTag`. Alternatively, use Tag Editor in the AWS Management Console to manage S3 bucket tags.**

```
Write-S3BucketTagging -BucketName cloudtrail-test-2018 -TagSet @( @{ Key="Stage";
 Value="Test" }, @{ Key="Environment"; Value="Alpha" } )
```

**Example 2: This command pipes a bucket named `cloudtrail-test-2018` into the `Write-S3BucketTagging` cmdlet. It applies tags Stage:Production and Department:Finance to the bucket. Note that `Write-S3BucketTagging` overwrites the entire existing tag set on a bucket.**

```
Get-S3Bucket -BucketName cloudtrail-test-2018 | Write-S3BucketTagging
 -TagSet @( @{ Key="Stage"; Value="Production" }, @{ Key="Department";
 Value="Finance" } )
```

- For API details, see PutBucketTagging in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `PutBucketVersioning` with an AWS SDK or CLI

The following code examples show how to use `PutBucketVersioning`.

CLI

### AWS CLI

The following command enables versioning on a bucket named `my-bucket`:

```
aws s3api put-bucket-versioning --bucket my-bucket --versioning-
configuration Status=Enabled
```

The following command enables versioning, and uses an mfa code

```
aws s3api put-bucket-versioning --bucket my-bucket --versioning-
configuration Status=Enabled --mfa "SERIAL 123456"
```

- For API details, see PutBucketVersioning in *AWS CLI Command Reference*.

PowerShell

### Tools for PowerShell

#### Example 1: The command enables versioning for the given S3 bucket.

```
Write-S3BucketVersioning -BucketName 's3testbucket' -VersioningConfig_Status
 Enabled
```

- For API details, see PutBucketVersioning in *AWS Tools for PowerShell Cmdlet Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `PutBucketWebsite` with an AWS SDK or CLI

The following code examples show how to use `PutBucketWebsite`.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
                // Put the website configuration.
                PutBucketWebsiteRequest putRequest = new
PutBucketWebsiteRequest()
                {
                    BucketName = bucketName,
                    WebsiteConfiguration = new WebsiteConfiguration()
                    {
                        IndexDocumentSuffix = indexDocumentSuffix,
                        ErrorDocument = errorDocument,
                    },
                };
                PutBucketWebsiteResponse response = await
client.PutBucketWebsiteAsync(putRequest);
```

- For API details, see PutBucketWebsite in *AWS SDK for .NET API Reference*.

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::S3::putWebsiteConfig(const Aws::String &bucketName,
                                  const Aws::String &indexPage, const Aws::String
 &errorPage,
                                  const Aws::S3::S3ClientConfiguration
 &clientConfig) {
    Aws::S3::S3Client client(clientConfig);

    Aws::S3::Model::IndexDocument indexDocument;
    indexDocument.SetSuffix(indexPage);

    Aws::S3::Model::ErrorDocument errorDocument;
    errorDocument.SetKey(errorPage);

    Aws::S3::Model::WebsiteConfiguration websiteConfiguration;
    websiteConfiguration.SetIndexDocument(indexDocument);
    websiteConfiguration.SetErrorDocument(errorDocument);

    Aws::S3::Model::PutBucketWebsiteRequest request;
    request.SetBucket(bucketName);
    request.SetWebsiteConfiguration(websiteConfiguration);

    Aws::S3::Model::PutBucketWebsiteOutcome outcome =
            client.PutBucketWebsite(request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Error: PutBucketWebsite: "
                  << outcome.GetError().GetMessage() << std::endl;
    } else {
        std::cout << "Success: Set website configuration for bucket '"
                  << bucketName << "'." << std::endl;
    }
```

```
    return outcome.IsSuccess();
}
```

- For API details, see PutBucketWebsite in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The applies a static website configuration to a bucket named `my-bucket`:

```
aws s3api put-bucket-website --bucket my-bucket --website-configuration file://
website.json
```

The file `website.json` is a JSON document in the current folder that specifies index and error pages for the website:

```
{
    "IndexDocument": {
        "Suffix": "index.html"
    },
    "ErrorDocument": {
        "Key": "error.html"
    }
}
```

- For API details, see PutBucketWebsite in *AWS CLI Command Reference*.

Java

**SDK for Java 2.x**

Set the website configuration.

```
import { PutBucketWebsiteCommand, S3Client } from "@aws-sdk/client-s3";
```

```
const client = new S3Client({});

// Set up a bucket as a static website.
// The bucket needs to be publicly accessible.
export const main = async () => {
  const command = new PutBucketWebsiteCommand({
    Bucket: "test-bucket",
    WebsiteConfiguration: {
      ErrorDocument: {
        // The object key name to use when a 4XX class error occurs.
        Key: "error.html",
      },
      IndexDocument: {
        // A suffix that is appended to a request that is for a directory.
        Suffix: "index.html",
      },
    },
  });

  try {
    const response = await client.send(command);
    console.log(response);
  } catch (err) {
    console.error(err);
  }
};
```

## Use `PutObject` with an AWS SDK or CLI

The following code examples show how to use `PutObject`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Get started with buckets and objects
- Track uploads and downloads
- Work with Amazon S3 object integrity

.NET

### AWS SDK for .NET

```
bool AwsDoc::S3::putObject(const Aws::String &bucketName,
                           const Aws::String &fileName,
                           const Aws::S3::S3ClientConfiguration &clientConfig) {
    Aws::S3::S3Client s3Client(clientConfig);

    Aws::S3::Model::PutObjectRequest request;
    request.SetBucket(bucketName);
    //We are using the name of the file as the key for the object in the bucket.
    //However, this is just a string and can be set according to your retrieval
 needs.
    request.SetKey(fileName);

    std::shared_ptr<Aws::IOStream> inputData =
            Aws::MakeShared<Aws::FStream>("SampleAllocationTag",
                                          fileName.c_str(),
```

```
                                            std::ios_base::in |
 std::ios_base::binary);

    if (!*inputData) {
        std::cerr << "Error unable to read file " << fileName << std::endl;
        return false;
    }

    request.SetBody(inputData);

    Aws::S3::Model::PutObjectOutcome outcome =
            s3Client.PutObject(request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Error: putObject: " <<
                  outcome.GetError().GetMessage() << std::endl;
    } else {
        std::cout << "Added object '" << fileName << "' to bucket '"
                  << bucketName << "'.";
    }

    return outcome.IsSuccess();
}
```

- For API details, see PutObject in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The following example uses the `put-object` command to upload an object to Amazon S3:

```
aws s3api put-object --bucket text-content --key dir-1/my_images.tar.bz2 --
body my_images.tar.bz2
```

The following example shows an upload of a video file (The video file is specified using Windows file system syntax.):

```
aws s3api put-object --bucket text-content --key dir-1/big-video-file.mp4 --body
 e:\media\videos\f-sharp-3-data-services.mp4
```

For more information about uploading objects, see Uploading Objects in the *Amazon S3 Developer Guide*.

- For API details, see PutObject in *AWS CLI Command Reference*.

Go

**SDK for Go V2**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Put an object in a bucket by using the low-level API.

```
// BucketBasics encapsulates the Amazon Simple Storage Service (Amazon S3)
 actions
// used in the examples.
// It contains S3Client, an Amazon S3 service client that is used to perform
 bucket
// and object actions.
type BucketBasics struct {
 S3Client *s3.Client
}

// UploadFile reads from a file and puts the data into an object in a bucket.
func (basics BucketBasics) UploadFile(bucketName string, objectKey string,
 fileName string) error {
 file, err := os.Open(fileName)
 if err != nil {
  log.Printf("Couldn't open file %v to upload. Here's why: %v\n", fileName, err)
 } else {
  defer file.Close()
  _, err = basics.S3Client.PutObject(context.TODO(), &s3.PutObjectInput{
   Bucket: aws.String(bucketName),
   Key:    aws.String(objectKey),
   Body:   file,
```

```
  })
  if err != nil {
   log.Printf("Couldn't upload file %v to %v:%v. Here's why: %v\n",
    fileName, bucketName, objectKey, err)
  }
 }
 return err
}
```

Upload an object to a bucket by using a transfer manager.

```
// S3Actions wraps S3 service actions.
type S3Actions struct {
 S3Client  *s3.Client
 S3Manager *manager.Uploader
}

// UploadObject uses the S3 upload manager to upload an object to a bucket.
func (actor S3Actions) UploadObject(ctx context.Context, bucket string, key
 string, contents string) (string, error) {
 var outKey string
 input := &s3.PutObjectInput{
  Bucket:            aws.String(bucket),
  Key:               aws.String(key),
  Body:              bytes.NewReader([]byte(contents)),
  ChecksumAlgorithm: types.ChecksumAlgorithmSha256,
 }
 output, err := actor.S3Manager.Upload(ctx, input)
 if err != nil {
  var noBucket *types.NoSuchBucket
  if errors.As(err, &noBucket) {
   log.Printf("Bucket %s does not exist.\n", bucket)
   err = noBucket
  }
 } else {
  err := s3.NewObjectExistsWaiter(actor.S3Client).Wait(ctx, &s3.HeadObjectInput{
   Bucket: aws.String(bucket),
   Key:    aws.String(key),
```

```
  }, time.Minute)
  if err != nil {
   log.Printf("Failed attempt to wait for object %s to exist in %s.\n", key,
 bucket)
  } else {
   outKey = *output.Key
  }
 }
 return outKey, err
}
```

- For API details, see PutObject in *AWS SDK for Go API Reference*.

Java

    public String uploadFile(S3TransferManager transferManager, String
 bucketName,
                             String key, URI filePathURI) {
        UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
            .putObjectRequest(b -> b.bucket(bucketName).key(key))
            .source(Paths.get(filePathURI))
            .build();

        FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);

        CompletedFileUpload uploadResult = fileUpload.completionFuture().join();
```

```
        return uploadResult.response().eTag();
    }
```

Upload an object to a bucket and set tags using an S3Client.

```
   public static void putS3ObjectTags(S3Client s3, String bucketName, String
objectKey, String objectPath) {
       try {
           Tag tag1 = Tag.builder()
                   .key("Tag 1")
                   .value("This is tag 1")
                   .build();

           Tag tag2 = Tag.builder()
                   .key("Tag 2")
                   .value("This is tag 2")
                   .build();

           List<Tag> tags = new ArrayList<>();
           tags.add(tag1);
           tags.add(tag2);

           Tagging allTags = Tagging.builder()
                   .tagSet(tags)
                   .build();

           PutObjectRequest putOb = PutObjectRequest.builder()
                   .bucket(bucketName)
                   .key(objectKey)
                   .tagging(allTags)
                   .build();

           s3.putObject(putOb,
RequestBody.fromBytes(getObjectFile(objectPath)));

       } catch (S3Exception e) {
           System.err.println(e.getMessage());
           System.exit(1);
       }
   }
```

```
   public static void updateObjectTags(S3Client s3, String bucketName, String
objectKey) {
       try {
           GetObjectTaggingRequest taggingRequest =
GetObjectTaggingRequest.builder()
                   .bucket(bucketName)

PHP

### SDK for PHP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Upload an object to a bucket.

```
        $s3client = new Aws\S3\S3Client(['region' => 'us-west-2']);

        $fileName = __DIR__ . "/local-file-" . uniqid();
        try {
            $this->s3client->putObject([
                'Bucket' => $this->bucketName,
                'Key' => $fileName,
                'SourceFile' => __DIR__ . '/testfile.txt'
            ]);
            echo "Uploaded $fileName to $this->bucketName.\n";
        } catch (Exception $exception) {
            echo "Failed to upload $fileName with error: " . $exception-
>getMessage();
            exit("Please fix error with file upload before continuing.");
        }
```

- For API details, see PutObject in *AWS SDK for PHP API Reference*.

PowerShell

### Tools for PowerShell

**Example 1: This command uploads the single file "local-sample.txt" to Amazon S3, creating an object with key "sample.txt" in bucket "test-files".**

```
Write-S3Object -BucketName test-files -Key "sample.txt" -File .\local-sample.txt
```

**Example 2: This command uploads the single file "sample.txt" to Amazon S3, creating an object with key "sample.txt" in bucket "test-files". If the -Key parameter is not supplied, the filename is used as the S3 object key.**

```
Write-S3Object -BucketName test-files -File .\sample.txt
```

**Example 3: This command uploads the single file "local-sample.txt" to Amazon S3, creating an object with key "prefix/to/sample.txt" in bucket "test-files".**

```
Write-S3Object -BucketName test-files -Key "prefix/to/sample.txt" -File .\local-
sample.txt
```

**Example 4: This command uploads all files in the subdirectory "Scripts" to the bucket "test-files" and applies the common key prefix "SampleScripts" to each object. Each uploaded file will have a key of "SampleScripts/filename" where 'filename' varies.**

```
Write-S3Object -BucketName test-files -Folder .\Scripts -KeyPrefix SampleScripts\
```

**Example 5: This command uploads all *.ps1 files in the local director "Scripts" to bucket "test-files" and applies the common key prefix "SampleScripts" to each object. Each uploaded file will have a key of "SampleScripts/filename.ps1" where 'filename' varies.**

```
Write-S3Object -BucketName test-files -Folder .\Scripts -KeyPrefix SampleScripts\
 -SearchPattern *.ps1
```

**Example 6: This command creates a new S3 object containing the specified content string with key 'sample.txt'.**

```
Write-S3Object -BucketName test-files -Key "sample.txt" -Content "object
 contents"
```

**Example 7: This command uploads the specified file (the filename is used as the key) and applies the specified tags to the new object.**

```
Write-S3Object -BucketName test-files -File "sample.txt" -TagSet
 @{Key="key1";Value="value1"},@{Key="key2";Value="value2"}
```

**Example 8: This command recursively uploads the specified folder and applies the specified tags to all the new objects.**

```
Write-S3Object -BucketName test-files -Folder . -KeyPrefix "TaggedFiles" -Recurse
 -TagSet @{Key="key1";Value="value1"},@{Key="key2";Value="value2"}
```

- For API details, see PutObject in *AWS Tools for PowerShell Cmdlet Reference*.

Python

Ruby

**SDK for Ruby**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Upload a file using a managed uploader (Object.upload_file).

```
require "aws-sdk-s3"
```

```
# Wraps Amazon S3 object actions.
class ObjectUploadFileWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  # Uploads a file to an Amazon S3 object by using a managed uploader.
  #
  # @param file_path [String] The path to the file to upload.
  # @return [Boolean] True when the file is uploaded; otherwise false.
  def upload_file(file_path)
    @object.upload_file(file_path)
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't upload file #{file_path} to #{@object.key}. Here's why:
 #{e.message}"
    false
  end
end

# Example usage:
def run_demo
  bucket_name = "doc-example-bucket"
  object_key = "my-uploaded-file"
  file_path = "object_upload_file.rb"

  wrapper = ObjectUploadFileWrapper.new(Aws::S3::Object.new(bucket_name,
 object_key))
  return unless wrapper.upload_file(file_path)

  puts "File #{file_path} successfully uploaded to #{bucket_name}:#{object_key}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Upload a file using Object.put.

```
require "aws-sdk-s3"
```

```
# Wraps Amazon S3 object actions.
class ObjectPutWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  def put_object(source_file_path)
    File.open(source_file_path, "rb") do |file|
      @object.put(body: file)
    end
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't put #{source_file_path} to #{object.key}. Here's why:
 #{e.message}"
    false
  end
end

# Example usage:
def run_demo
  bucket_name = "doc-example-bucket"
  object_key = "my-object-key"
  file_path = "my-local-file.txt"

  wrapper = ObjectPutWrapper.new(Aws::S3::Object.new(bucket_name, object_key))
  success = wrapper.put_object(file_path)
  return unless success

  puts "Put file #{file_path} into #{object_key} in #{bucket_name}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Upload a file using Object.put and add server-side encryption.

```
require "aws-sdk-s3"

# Wraps Amazon S3 object actions.
```

```
class ObjectPutSseWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  def put_object_encrypted(object_content, encryption)
    @object.put(body: object_content, server_side_encryption: encryption)
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't put your content to #{object.key}. Here's why: #{e.message}"
    false
  end
end

# Example usage:
def run_demo
  bucket_name = "doc-example-bucket"
  object_key = "my-encrypted-content"
  object_content = "This is my super-secret content."
  encryption = "AES256"

  wrapper = ObjectPutSseWrapper.new(Aws::S3::Object.new(bucket_name,
 object_content))
  return unless wrapper.put_object_encrypted(object_content, encryption)

  puts "Put your content into #{bucket_name}:#{object_key} and encrypted it with
 #{encryption}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

    ENDTRY.
```

- For API details, see PutObject in *AWS SDK for SAP ABAP API reference*.

Swift

**SDK for Swift**

> **Note**
>
> This is prerelease documentation for an SDK in preview release. It is subject to change.

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Upload a file from local storage to a bucket.

```
    public func uploadFile(bucket: String, key: String, file: String) async
throws {
        let fileUrl = URL(fileURLWithPath: file)
        let fileData = try Data(contentsOf: fileUrl)
        let dataStream = ByteStream.data(fileData)

        let input = PutObjectInput(
            body: dataStream,
            bucket: bucket,
            key: key
        )
        _ = try await client.putObject(input: input)
    }
```

Upload the contents of a Swift Data object to a bucket.

```
    public func createFile(bucket: String, key: String, withData data: Data)
async throws {
        let dataStream = ByteStream.data(data)

        let input = PutObjectInput(
            body: dataStream,
            bucket: bucket,
            key: key
        )
        _ = try await client.putObject(input: input)
    }
```

- For API details, see PutObject in *AWS SDK for Swift API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `PutObjectAcl` with an AWS SDK or CLI

The following code examples show how to use `PutObjectAcl`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage access control lists (ACLs)

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
bool AwsDoc::S3::putObjectAcl(const Aws::String &bucketName, const Aws::String
 &objectKey, const Aws::String &ownerID,
                               const Aws::String &granteePermission, const
 Aws::String &granteeType,
                               const Aws::String &granteeID, const Aws::String
 &granteeEmailAddress,
                               const Aws::String &granteeURI, const
 Aws::S3::S3ClientConfiguration &clientConfig) {
    Aws::S3::S3Client s3Client(clientConfig);

    Aws::S3::Model::Owner owner;
    owner.SetID(ownerID);

    Aws::S3::Model::Grantee grantee;
    grantee.SetType(setGranteeType(granteeType));

    if (!granteeEmailAddress.empty()) {
        grantee.SetEmailAddress(granteeEmailAddress);
    }

    if (!granteeID.empty()) {
        grantee.SetID(granteeID);
    }

    if (!granteeURI.empty()) {
        grantee.SetURI(granteeURI);
```

```
    }

    Aws::S3::Model::Grant grant;
    grant.SetGrantee(grantee);
    grant.SetPermission(setGranteePermission(granteePermission));

    Aws::Vector<Aws::S3::Model::Grant> grants;
    grants.push_back(grant);

    Aws::S3::Model::AccessControlPolicy acp;
    acp.SetOwner(owner);
    acp.SetGrants(grants);

    Aws::S3::Model::PutObjectAclRequest request;
    request.SetAccessControlPolicy(acp);
    request.SetBucket(bucketName);
    request.SetKey(objectKey);

    Aws::S3::Model::PutObjectAclOutcome outcome =
            s3Client.PutObjectAcl(request);

    if (!outcome.IsSuccess()) {
        auto error = outcome.GetError();
        std::cerr << "Error: putObjectAcl: " << error.GetExceptionName()
                  << " - " << error.GetMessage() << std::endl;
    } else {
        std::cout << "Successfully added an ACL to the object '" << objectKey
                  << "' in the bucket '" << bucketName << "'." << std::endl;
    }

    return outcome.IsSuccess();
}

//! Routine which converts a human-readable string to a built-in type
 enumeration.
/*!
 \param access: Human readable string.
 \return Permission: Permission enumeration.
*/
Aws::S3::Model::Permission setGranteePermission(const Aws::String &access) {
    if (access == "FULL_CONTROL")
        return Aws::S3::Model::Permission::FULL_CONTROL;
    if (access == "WRITE")
        return Aws::S3::Model::Permission::WRITE;
```

```
    if (access == "READ")
        return Aws::S3::Model::Permission::READ;

        return Aws::S3::Model::Permission::WRITE_ACP;
    if (access == "READ_ACP")
        return Aws::S3::Model::Permission::READ_ACP;
    return Aws::S3::Model::Permission::NOT_SET;
}

//! Routine which converts a human-readable string to a built-in type
 enumeration.
/*!
 \param type: Human readable string.
 \return Type: Type enumeration.
*/
Aws::S3::Model::Type setGranteeType(const Aws::String &type) {
    if (type == "Amazon customer by email")
        return Aws::S3::Model::Type::AmazonCustomerByEmail;
    if (type == "Canonical user")
        return Aws::S3::Model::Type::CanonicalUser;
    if (type == "Group")
        return Aws::S3::Model::Type::Group;
    return Aws::S3::Model::Type::NOT_SET;
}
```

- For API details, see PutObjectAcl in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The following command grants `full control` to two AWS users (*user1@example.com* and *user2@example.com*) and `read` permission to everyone:

```
aws s3api put-object-acl --bucket MyBucket --key file.txt --grant-full-
control emailaddress=user1@example.com,emailaddress=user2@example.com --grant-
read uri=http://acs.amazonaws.com/groups/global/AllUsers
```

See http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html for details on custom ACLs (the s3api ACL commands, such as `put-object-acl`, use the same shorthand argument notation).

- For API details, see PutObjectAcl in *AWS CLI Command Reference*.

Python

**SDK for Python (Boto3)**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class ObjectWrapper:
    """Encapsulates S3 object actions."""

    def __init__(self, s3_object):
        """
        :param s3_object: A Boto3 Object resource. This is a high-level resource
 in Boto3
                          that wraps object actions in a class-like structure.
        """
        self.object = s3_object
        self.key = self.object.key

    def put_acl(self, email):
        """
        Applies an ACL to the object that grants read access to an AWS user
 identified
        by email address.

        :param email: The email address of the user to grant access.
        """
        try:
            acl = self.object.Acl()
            # Putting an ACL overwrites the existing ACL, so append new grants
            # if you want to preserve existing grants.
            grants = acl.grants if acl.grants else []
```

```
            grants.append(
                {
                    "Grantee": {"Type": "AmazonCustomerByEmail", "EmailAddress":
email},
                    "Permission": "READ",
                }
            )
            acl.put(AccessControlPolicy={"Grants": grants, "Owner": acl.owner})
            logger.info("Granted read access to %s.", email)
        except ClientError:
            logger.exception("Couldn't add ACL to object '%s'.", self.object.key)
            raise
```

- For API details, see PutObjectAcl in *AWS SDK for Python (Boto3) API Reference*.

## Use `PutObjectLegalHold` with an AWS SDK or CLI

The following code examples show how to use `PutObjectLegalHold`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Lock Amazon S3 objects

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Set or modify a legal hold on an object in an S3 bucket.
    /// </summary>
    /// <param name="bucketName">The bucket of the object.</param>
    /// <param name="objectKey">The key of the object.</param>
    /// <param name="holdStatus">The On or Off status for the legal hold.</param>
    /// <returns>True if successful.</returns>
    public async Task<bool> ModifyObjectLegalHold(string bucketName,
        string objectKey, ObjectLockLegalHoldStatus holdStatus)
    {
        try
        {
            var request = new PutObjectLegalHoldRequest()
            {
                BucketName = bucketName,
                Key = objectKey,
                LegalHold = new ObjectLockLegalHold()
                {
                    Status = holdStatus
                }
            };

            var response = await _amazonS3.PutObjectLegalHoldAsync(request);
            Console.WriteLine($"\tModified legal hold for {objectKey} in
{bucketName}.");
            return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine($"\tError modifying legal hold: '{ex.Message}'");
            return false;
        }
    }
```

- For API details, see PutObjectLegalHold in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

**To apply a Legal Hold to an object**

The following `put-object-legal-hold` example sets a Legal Hold on the object `doc1.rtf`.

```
aws s3api put-object-legal-hold \
    --bucket my-bucket-with-object-lock \
    --key doc1.rtf \
    --legal-hold Status=ON
```

This command produces no output.

- For API details, see PutObjectLegalHold in *AWS CLI Command Reference*.

Go

**SDK for Go V2**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// S3Actions wraps S3 service actions.
type S3Actions struct {
 S3Client  *s3.Client
 S3Manager *manager.Uploader
}

// PutObjectLegalHold sets the legal hold configuration for an S3 object.
func (actor S3Actions) PutObjectLegalHold(ctx context.Context, bucket string, key
 string, versionId string, legalHoldStatus types.ObjectLockLegalHoldStatus) error
 {
 input := &s3.PutObjectLegalHoldInput{
  Bucket: aws.String(bucket),
  Key:    aws.String(key),
  LegalHold: &types.ObjectLockLegalHold{
   Status: legalHoldStatus,
  },
```

```
 }
 if versionId != "" {
  input.VersionId = aws.String(versionId)
 }

 _, err := actor.S3Client.PutObjectLegalHold(ctx, input)
 if err != nil {
  var noKey *types.NoSuchKey
  if errors.As(err, &noKey) {
   log.Printf("Object %s does not exist in bucket %s.\n", key, bucket)
   err = noKey
  }
 }

 return err
}
```

- For API details, see PutObjectLegalHold in *AWS SDK for Go API Reference*.

Java

**SDK for Java 2.x**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   // Set or modify a legal hold on an object in an S3 bucket.
   public void modifyObjectLegalHold(String bucketName, String objectKey,
boolean legalHoldOn) {
       ObjectLockLegalHold legalHold ;
       if (legalHoldOn) {
           legalHold = ObjectLockLegalHold.builder()
               .status(ObjectLockLegalHoldStatus.ON)
               .build();
       } else {
           legalHold = ObjectLockLegalHold.builder()
               .status(ObjectLockLegalHoldStatus.OFF)
```

```
                .build();
        }

        PutObjectLegalHoldRequest legalHoldRequest =
 PutObjectLegalHoldRequest.builder()
            .bucket(bucketName)
            .key(objectKey)
            .legalHold(legalHold)
            .build();

        getClient().putObjectLegalHold(legalHoldRequest) ;
        System.out.println("Modified legal hold for "+ objectKey +" in
"+bucketName +".");
    }
```

- For API details, see PutObjectLegalHold in *AWS SDK for Java 2.x API Reference*.

## Use `PutObjectLockConfiguration` with an AWS SDK or CLI

The following code examples show how to use `PutObjectLockConfiguration`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Lock Amazon S3 objects

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Set the object lock configuration of a bucket.

```
    /// <summary>
    /// Enable object lock on an existing bucket.
    /// </summary>
    /// <param name="bucketName">The name of the bucket to modify.</param>
    /// <returns>True if successful.</returns>
    public async Task<bool> EnableObjectLockOnBucket(string bucketName)
    {
        try
        {
            // First, enable Versioning on the bucket.
            await _amazonS3.PutBucketVersioningAsync(new
PutBucketVersioningRequest()
            {
                BucketName = bucketName,
                VersioningConfig = new S3BucketVersioningConfig()
                {
                    EnableMfaDelete = false,
                    Status = VersionStatus.Enabled
                }
            });

            var request = new PutObjectLockConfigurationRequest()
            {
                BucketName = bucketName,
                ObjectLockConfiguration = new ObjectLockConfiguration()
```

```
                {
                    ObjectLockEnabled = new ObjectLockEnabled("Enabled"),
                },
            };

            var response = await
_amazonS3.PutObjectLockConfigurationAsync(request);
            Console.WriteLine($"\tAdded an object lock policy to bucket
{bucketName}.");
            return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine($"Error modifying object lock: '{ex.Message}'");
            return false;
        }
    }
```

Set the default retention period of a bucket.

```
    /// <summary>
    /// Set or modify a retention period on an S3 bucket.
    /// </summary>
    /// <param name="bucketName">The bucket to modify.</param>

                    EnableMfaDelete = false,
```

```
                    Status = VersionStatus.Enabled
                }
            });

            var request = new PutObjectLockConfigurationRequest()
            {
                BucketName = bucketName,
                ObjectLockConfiguration = new ObjectLockConfiguration()
                {
                    ObjectLockEnabled = new ObjectLockEnabled(enabledString),
                    Rule = new ObjectLockRule()
                    {
                        DefaultRetention = new DefaultRetention()
                        {
                            Mode = retention,
                            Days = timeDifference.Days // Can be specified in
days or years but not both.
                        }
                    }
                }
            };

            var response = await
_amazonS3.PutObjectLockConfigurationAsync(request);
            Console.WriteLine($"\tAdded a default retention to bucket
{bucketName}.");
            return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine($"\tError modifying object lock: '{ex.Message}'");
            return false;
        }
    }
```

- For API details, see [PutObjectLockConfiguration](#) in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

**To set an object lock configuration on a bucket**

The following `put-object-lock-configuration` example sets a 50-day object lock on the specified bucket.

```
aws s3api put-object-lock-configuration \
    --bucket my-bucket-with-object-lock \
    --object-lock-configuration '{ "ObjectLockEnabled": "Enabled", "Rule":
 { "DefaultRetention": { "Mode": "COMPLIANCE", "Days": 50 }}}'
```

This command produces no output.

- For API details, see PutObjectLockConfiguration in *AWS CLI Command Reference*.

Go

**SDK for Go V2**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Set the object lock configuration of a bucket.

```
// S3Actions wraps S3 service actions.
type S3Actions struct {
 S3Client  *s3.Client
 S3Manager *manager.Uploader
}

// EnableObjectLockOnBucket enables object locking on an existing bucket.
func (actor S3Actions) EnableObjectLockOnBucket(ctx context.Context, bucket
 string) error {
 // Versioning must be enabled on the bucket before object locking is enabled.
 verInput := &s3.PutBucketVersioningInput{
  Bucket: aws.String(bucket),
  VersioningConfiguration: &types.VersioningConfiguration{
   MFADelete: types.MFADeleteDisabled,
```

```
   Status:    types.BucketVersioningStatusEnabled,
  },
 }
 _, err := actor.S3Client.PutBucketVersioning(ctx, verInput)

## Use `PutObjectRetention` with an AWS SDK or CLI

The following code examples show how to use `PutObjectRetention`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Lock Amazon S3 objects

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Set or modify a retention period on an object in an S3 bucket.
    /// </summary>
    /// <param name="bucketName">The bucket of the object.</param>
    /// <param name="objectKey">The key of the object.</param>
    /// <param name="retention">The retention mode.</param>
```

```
    /// <param name="retainUntilDate">The date retention expires.</param>
    /// <returns>True if successful.</returns>
    public async Task<bool> ModifyObjectRetentionPeriod(string bucketName,
        string objectKey, ObjectLockRetentionMode retention, DateTime
retainUntilDate)
    {
        try
        {
            var request = new PutObjectRetentionRequest()
            {
                BucketName = bucketName,
                Key = objectKey,
                Retention = new ObjectLockRetention()
                {
                    Mode = retention,
                    RetainUntilDate = retainUntilDate
                }
            };

            var response = await _amazonS3.PutObjectRetentionAsync(request);
            Console.WriteLine($"\tSet retention for {objectKey} in {bucketName}
until {retainUntilDate:d}.");
            return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine($"\tError modifying retention period:
'{ex.Message}'");
            return false;
        }
    }
```

- For API details, see [PutObjectRetention](#) in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

**To set an object retention configuration for an object**

The following `put-object-retention` example sets an object retention configuration for the specified object until 2025-01-01.

```
aws s3api put-object-retention \
    --bucket my-bucket-with-object-lock \
    --key doc1.rtf \
    --retention '{ "Mode": "GOVERNANCE", "RetainUntilDate":
 "2025-01-01T00:00:00" }'
```

This command produces no output.

- For API details, see PutObjectRetention in *AWS CLI Command Reference*.

Go

**SDK for Go V2**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
// S3Actions wraps S3 service actions.
type S3Actions struct {
 S3Client  *s3.Client
 S3Manager *manager.Uploader
}

// PutObjectRetention sets the object retention configuration for an S3 object.
func (actor S3Actions) PutObjectRetention(ctx context.Context, bucket string, key
 string, retentionMode types.ObjectLockRetentionMode, retentionPeriodDays int32)
 error {
 input := &s3.PutObjectRetentionInput{
  Bucket: aws.String(bucket),
  Key:    aws.String(key),

                Key = objectKey,
            };

            GetObjectMetadataResponse response = await
client.GetObjectMetadataAsync(metadataRequest);

            var restStatus = response.RestoreInProgress ? "in-progress" :
"finished or failed";
            Console.WriteLine($"Restoration status: {restStatus}");
        }
    }
```

- For API details, see RestoreObject in *AWS SDK for .NET API Reference*.

CLI

**AWS CLI**

**To create a restore request for an object**

The following `restore-object` example restores the specified Amazon S3 Glacier object for the bucket `my-glacier-bucket` for 10 days.

```
aws s3api restore-object \
    --bucket my-glacier-bucket \
    --key doc1.rtf \
    --restore-request Days=10
```

This command produces no output.

- For API details, see RestoreObject in *AWS CLI Command Reference*.

        String keyName = args[1];
        String expectedBucketOwner = args[2];
        Region region = Region.US_EAST_1;
        S3Client s3 = S3Client.builder()
                .region(region)
                .build();

        restoreS3Object(s3, bucketName, keyName, expectedBucketOwner);
        s3.close();
    }

    public static void restoreS3Object(S3Client s3, String bucketName, String
keyName, String expectedBucketOwner) {
        try {
            RestoreRequest restoreRequest = RestoreRequest.builder()
                    .days(10)

.glacierJobParameters(GlacierJobParameters.builder().tier(Tier.STANDARD).build())
                    .build();

            RestoreObjectRequest objectRequest = RestoreObjectRequest.builder()
                    .expectedBucketOwner(expectedBucketOwner)
                    .bucket(bucketName)
                    .key(keyName)
                    .restoreRequest(restoreRequest)
                    .build();

            s3.restoreObject(objectRequest);

        } catch (S3Exception e) {
            System.err.println(e.awsErrorDetails().errorMessage());
            System.exit(1);
        }
    }
```

```
}
```

- For API details, see RestoreObject in *AWS SDK for Java 2.x API Reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Use `SelectObjectContent` with an AWS SDK or CLI

The following code examples show how to use `SelectObjectContent`.

CLI

**AWS CLI**

**To filter the contents of an Amazon S3 object based on an SQL statement**

The following `select-object-content` example filters the object `my-data-file.csv` with the specified SQL statement and sends output to a file.

```
aws s3api select-object-content \
    --bucket my-bucket \
    --key my-data-file.csv \
    --expression "select * from s3object limit 100" \
    --expression-type 'SQL' \
    --input-serialization '{"CSV": {}, "CompressionType": "NONE"}' \
    --output-serialization '{"CSV": {}}' "output.csv"
```

This command produces no output.

- For API details, see SelectObjectContent in *AWS CLI Command Reference*.

## Use `UploadPart` with an AWS SDK or CLI

The following code examples show how to use `UploadPart`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Perform a multipart upload
- Use checksums
- Work with Amazon S3 object integrity

C++

### SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
//! Upload a part to an S3 bucket.
/*!
    \param bucket: The name of the S3 bucket where the object will be uploaded.
    \param key: The unique identifier (key) for the object within the S3 bucket.
    \param uploadID: An upload ID string.
    \param partNumber:
    \param checksumAlgorithm: Checksum algorithm, ignored when NOT_SET.
    \param calculatedHash: A data integrity hash to set, depending on the
 checksum algorithm,
                           ignored when it is an empty string.
    \param body: An shared_ptr IOStream of the data to be uploaded.
    \param client: The S3 client instance used to perform the upload operation.
    \return UploadPartOutcome: The outcome.
*/

Aws::S3::Model::UploadPartOutcome AwsDoc::S3::uploadPart(const Aws::String
 &bucket,
                                                         const Aws::String &key,
                                                         const Aws::String
 &uploadID,

 Aws::S3::Model::ChecksumAlgorithm checksumAlgorithm,
                                                         const Aws::String
 &calculatedHash,
                                                         const
 std::shared_ptr<Aws::IOStream> &body,
                                                         const Aws::S3::S3Client
 &client) {
    Aws::S3::Model::UploadPartRequest request;
    request.SetBucket(bucket);
    request.SetKey(key);
```

```
    request.SetUploadId(uploadID);
    request.SetPartNumber(partNumber);
    if (checksumAlgorithm != Aws::S3::Model::ChecksumAlgorithm::NOT_SET) {
        request.SetChecksumAlgorithm(checksumAlgorithm);
    }
    request.SetBody(body);

    if (!calculatedHash.empty()) {
        switch (checksumAlgorithm) {
            case Aws::S3::Model::ChecksumAlgorithm::NOT_SET:
                request.SetContentMD5(calculatedHash);
                break;
            case Aws::S3::Model::ChecksumAlgorithm::CRC32:
                request.SetChecksumCRC32(calculatedHash);
                break;
            case Aws::S3::Model::ChecksumAlgorithm::CRC32C:
                request.SetChecksumCRC32C(calculatedHash);
                break;
            case Aws::S3::Model::ChecksumAlgorithm::SHA1:
                request.SetChecksumSHA1(calculatedHash);
                break;
            case Aws::S3::Model::ChecksumAlgorithm::SHA256:
                request.SetChecksumSHA256(calculatedHash);
                break;
        }
    }

    return client.UploadPart(request);
}
```

- For API details, see UploadPart in *AWS SDK for C++ API Reference*.

CLI

**AWS CLI**

The following command uploads the first part in a multipart upload initiated with the `create-multipart-upload` command:

```
aws s3api upload-part --bucket my-bucket --key 'multipart/01' --part-number 1 --
body part01 --upload-id
  "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P
```

The body option takes the name or path of a local file for upload (do not use the file:// prefix). The minimum part size is 5 MB. Upload ID is returned by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`. Bucket and key are specified when you create the multipart upload.

Output:

```
{
    "ETag": "\"e868e0f4719e394144ef36531ee6824c\""
}
```

Save the ETag value of each part for later. They are required to complete the multipart upload.

- For API details, see UploadPart in *AWS CLI Command Reference*.

Rust

**SDK for Rust**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
        let upload_part_res = client
            .upload_part()
            .key(&key)
            .bucket(&bucket_name)
            .upload_id(upload_id)
            .body(stream)
            .part_number(part_number)
            .send()
            .await?;
        upload_parts.push(
```

```
            CompletedPart::builder()
                .e_tag(upload_part_res.e_tag.unwrap_or_default())
                .part_number(part_number)
                .build(),
        );

    let completed_multipart_upload: CompletedMultipartUpload =
CompletedMultipartUpload::builder()
        .set_parts(Some(upload_parts))
        .build();
```

- For API details, see UploadPart in *AWS SDK for Rust API reference*.

## Scenarios for Amazon S3 using AWS SDKs

The following code examples show you how to implement common scenarios in Amazon S3 with AWS SDKs. These scenarios show you how to accomplish specific tasks by calling multiple functions within Amazon S3. Each scenario includes a link to GitHub, where you can find instructions on how to set up and run the code.

**Examples**

- Create a presigned URL for Amazon S3 using an AWS SDK
- A web page that lists Amazon S3 objects using an AWS SDK
- Delete incomplete multipart uploads to Amazon S3 using an AWS SDK
- Download all objects in an Amazon Simple Storage Service (Amazon S3) bucket to a local directory
- Get an Amazon S3 object from a Multi-Region Access Point by using an AWS SDK
- Get an object from an Amazon S3 bucket using an AWS SDK, specifying an If-Modified-Since header
- Get started with Amazon S3 buckets and objects using an AWS SDK
- Get started with encryption for Amazon S3 objects using an AWS SDK

- Get started with tags for Amazon S3 objects using an AWS SDK
- Get the legal hold configuration of an Amazon S3 object using an AWS SDK
- Work with Amazon S3 object lock features using an AWS SDK
- Manage access control lists (ACLs) for Amazon S3 buckets using an AWS SDK
- Manage versioned Amazon S3 objects in batches with a Lambda function using an AWS SDK
- Parse Amazon S3 URIs using an AWS SDK
- Perform a multipart copy of an Amazon S3 object using an AWS SDK
- Perform a multipart upload of an Amazon S3 object using an AWS SDK
- Receive and process Amazon S3 event notifications by using an AWS SDK.
- Send S3 event notifications to Amazon EventBridge using an AWS SDK
- Track an Amazon S3 object upload or download using an AWS SDK
- Example approaches for unit and integration testing with an AWS SDK
- Recursively upload a local directory to an Amazon Simple Storage Service (Amazon S3) bucket
- Upload or download large files to and from Amazon S3 using an AWS SDK
- Upload a stream of unknown size to an Amazon S3 object using an AWS SDK
- Use checksums to work with an Amazon S3 object using an AWS SDK
- Work with Amazon S3 object integrity features using an AWS SDK
- Work with Amazon S3 versioned objects using an AWS SDK

## Create a presigned URL for Amazon S3 using an AWS SDK

The following code examples show how to create a presigned URL for Amazon S3 and upload an object.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Generate a presigned URL that can perform an Amazon S3 action for a limited time.

```
    using System;
    using Amazon;
    using Amazon.S3;
    using Amazon.S3.Model;

    public class GenPresignedUrl
    {
        public static void Main()
        {
            const string bucketName = "doc-example-bucket";
            const string objectKey = "sample.txt";

            // Specify how long the presigned URL lasts, in hours
            const double timeoutDuration = 12;

            // Specify the AWS Region of your Amazon S3 bucket. If it is
            // different from the Region defined for the default user,
            // pass the Region to the constructor for the client. For
            // example: new AmazonS3Client(RegionEndpoint.USEast1);

            // If using the Region us-east-1, and server-side encryption with AWS
 KMS, you must specify Signature Version 4.
            // Region us-east-1 defaults to Signature Version 2 unless explicitly
 set to Version 4 as shown below.
            // For more details, see https://docs.aws.amazon.com/AmazonS3/latest/
userguide/UsingAWSSDK.html#specify-signature-version
            // and https://docs.aws.amazon.com/sdkfornet/v3/apidocs/items/Amazon/
TAWSConfigsS3.html
            AWSConfigsS3.UseSignatureVersion4 = true;
            IAmazonS3 s3Client = new AmazonS3Client(RegionEndpoint.USEast1);

            string urlString = GeneratePresignedURL(s3Client, bucketName,
 objectKey, timeoutDuration);
            Console.WriteLine($"The generated URL is: {urlString}.");
        }

        /// <summary>
        /// Generate a presigned URL that can be used to access the file named
        /// in the objectKey parameter for the amount of time specified in the
        /// duration parameter.
        /// </summary>
        /// <param name="client">An initialized S3 client object used to call
```

```
        /// the GetPresignedUrl method.</param>
        /// <param name="bucketName">The name of the S3 bucket containing the
        /// object for which to create the presigned URL.</param>
        /// <param name="objectKey">The name of the object to access with the
        /// presigned URL.</param>
        /// <param name="duration">The length of time for which the presigned
        /// URL will be valid.</param>
        /// <returns>A string representing the generated presigned URL.</returns>
        public static string GeneratePresignedURL(IAmazonS3 client, string
bucketName, string objectKey, double duration)
        {
            string urlString = string.Empty;
            try
            {
                var request = new GetPreSignedUrlRequest()
                {
                    BucketName = bucketName,
                    Key = objectKey,
                    Expires = DateTime.UtcNow.AddHours(duration),
                };
                urlString = client.GetPreSignedURL(request);
            }
            catch (AmazonS3Exception ex)
            {
                Console.WriteLine($"Error:'{ex.Message}'");
            }

            return urlString;
        }
    }
```

Generate a presigned URL and perform an upload using that URL.

Create functions that wrap S3 presigning actions.

```
// Presigner encapsulates the Amazon Simple Storage Service (Amazon S3) presign
 actions
// used in the examples.
// It contains PresignClient, a client that is used to presign requests to Amazon
 S3.
// Presigned requests contain temporary credentials and can be made from any HTTP
 client.
type Presigner struct {
 PresignClient *s3.PresignClient
}

// GetObject makes a presigned request that can be used to get an object from a
 bucket.
// The presigned request is valid for the specified number of seconds.
func (presigner Presigner) GetObject(
 bucketName string, objectKey string, lifetimeSecs int64)
 (*v4.PresignedHTTPRequest, error) {
 request, err := presigner.PresignClient.PresignGetObject(context.TODO(),
 &s3.GetObjectInput{
  Bucket: aws.String(bucketName),
  Key:    aws.String(objectKey),
 }, func(opts *s3.PresignOptions) {
  opts.Expires = time.Duration(lifetimeSecs * int64(time.Second))
 })
 if err != nil {
  log.Printf("Couldn't get a presigned request to get %v:%v. Here's why: %v\n",
   bucketName, objectKey, err)
 }
 return request, err
}

// PutObject makes a presigned request that can be used to put an object in a
 bucket.
// The presigned request is valid for the specified number of seconds.
func (presigner Presigner) PutObject(
 bucketName string, objectKey string, lifetimeSecs int64)
 (*v4.PresignedHTTPRequest, error) {
```

```
 request, err := presigner.PresignClient.PresignPutObject(context.TODO(),
 &s3.PutObjectInput{
  Bucket: aws.String(bucketName),
  Key:    aws.String(objectKey),
 }, func(opts *s3.PresignOptions) {
  opts.Expires = time.Duration(lifetimeSecs * int64(time.Second))
 })
 if err != nil {
  log.Printf("Couldn't get a presigned request to put %v:%v. Here's why: %v\n",
   bucketName, objectKey, err)
 }
 return request, err
}

// DeleteObject makes a presigned request that can be used to delete an object
 from a bucket.
func (presigner Presigner) DeleteObject(bucketName string, objectKey string)
 (*v4.PresignedHTTPRequest, error) {
 request, err := presigner.PresignClient.PresignDeleteObject(context.TODO(),
 &s3.DeleteObjectInput{
  Bucket: aws.String(bucketName),
  Key:    aws.String(objectKey),
 })
 if err != nil {
  log.Printf("Couldn't get a presigned request to delete object %v. Here's why:
 %v\n", objectKey, err)
 }
 return request, err
}
```

Run an interactive example that generates and uses presigned URLs to upload, download, and delete an S3 object.

```

// RunPresigningScenario is an interactive example that shows you how to get
 presigned
// HTTP requests that you can use to move data into and out of Amazon Simple
 Storage
```

```
// Service (Amazon S3). The presigned requests contain temporary credentials and
 can
// be used by an HTTP client.
//
// 1. Get a presigned request to put an object in a bucket.
// 2. Use the net/http package to use the presigned request to upload a local
 file to the bucket.
// 3. Get a presigned request to get an object from a bucket.
// 4. Use the net/http package to use the presigned request to download the
 object to a local file.
// 5. Get a presigned request to delete an object from a bucket.
// 6. Use the net/http package to use the presigned request to delete the object.
//
// This example creates an Amazon S3 presign client from the specified sdkConfig
 so that
// you can replace it with a mocked or stubbed config for unit testing.
//
// It uses a questioner from the `demotools` package to get input during the
 example.

*/
   public String createPresignedGetUrl(String bucketName, String keyName) {
       try (S3Presigner presigner = S3Presigner.create()) {

           GetObjectRequest objectRequest = GetObjectRequest.builder()
                   .bucket(bucketName)
                   .key(keyName)
                   .build();

           GetObjectPresignRequest presignRequest =
GetObjectPresignRequest.builder()
                   .signatureDuration(Duration.ofMinutes(10))  // The URL will
expire in 10 minutes.
                   .getObjectRequest(objectRequest)
                   .build();

           PresignedGetObjectRequest presignedRequest =
presigner.presignGetObject(presignRequest);
           logger.info("Presigned URL: [{}]",
presignedRequest.url().toString());
           logger.info("HTTP method: [{}]",
presignedRequest.httpRequest().method());

           return presignedRequest.url().toExternalForm();
       }
   }
```

Download the object by using any one of the following three approaches.

Use JDK `HttpURLConnection` (since v1.1) class to do the download.

```
   /* Use the JDK HttpURLConnection (since v1.1) class to do the download. */
   public byte[] useHttpUrlConnectionToGet(String presignedUrlString) {
       ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.

       try {
           URL presignedUrl = new URL(presignedUrlString);
           HttpURLConnection connection = (HttpURLConnection)
presignedUrl.openConnection();
           connection.setRequestMethod("GET");
           // Download the result of executing the request.
           try (InputStream content = connection.getInputStream()) {
               IoUtils.copy(content, byteArrayOutputStream);
           }
           logger.info("HTTP response code is " + connection.getResponseCode());

       } catch (S3Exception | IOException e) {
           logger.error(e.getMessage(), e);
       }
       return byteArrayOutputStream.toByteArray();
   }
```

Use JDK `HttpClient` (since v11) class to do the download.

```
   /* Use the JDK HttpClient (since v11) class to do the download. */
   public byte[] useHttpClientToGet(String presignedUrlString) {
       ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.

       HttpRequest.Builder requestBuilder = HttpRequest.newBuilder();
       HttpClient httpClient = HttpClient.newHttpClient();
       try {
           URL presignedUrl = new URL(presignedUrlString);
           HttpResponse<InputStream> response = httpClient.send(requestBuilder
                           .uri(presignedUrl.toURI())
                           .GET()
                           .build(),
                   HttpResponse.BodyHandlers.ofInputStream());
```

```
            IoUtils.copy(response.body(), byteArrayOutputStream);

            logger.info("HTTP response code is " + response.statusCode());

        } catch (URISyntaxException | InterruptedException | IOException e) {
            logger.error(e.getMessage(), e);
        }
        return byteArrayOutputStream.toByteArray();
    }
```

Use the AWS SDK for Java `SdkHttpClient` class to do the download.

```
    /* Use the AWS SDK for Java SdkHttpClient class to do the download. */
    public byte[] useSdkHttpClientToPut(String presignedUrlString) {

        ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.
        try {
            URL presignedUrl = new URL(presignedUrlString);
            SdkHttpRequest request = SdkHttpRequest.builder()
                    .method(SdkHttpMethod.GET)
                    .uri(presignedUrl.toURI())
                    .build();

            HttpExecuteRequest executeRequest = HttpExecuteRequest.builder()
                    .request(request)
                    .build();

            try (SdkHttpClient sdkHttpClient = ApacheHttpClient.create()) {
                HttpExecuteResponse response =
sdkHttpClient.prepareRequest(executeRequest).call();
                response.responseBody().ifPresentOrElse(
                        abortableInputStream -> {
                            try {
                                IoUtils.copy(abortableInputStream,
byteArrayOutputStream);
                            } catch (IOException e) {
                                throw new RuntimeException(e);
                            }
                        },
                        () -> logger.error("No response body."));
```

```
                logger.info("HTTP Response code is {}",
 response.httpResponse().statusCode());
            }
        } catch (URISyntaxException | IOException e) {
            logger.error(e.getMessage(), e);
        }
        return byteArrayOutputStream.toByteArray();
    }
```

Generate a pre-signed URL for an upload, then upload a file (PUT request).

   }
```

Upload a file object by using any one of the following three approaches.

Use the JDK `HttpURLConnection` (since v1.1) class to do the upload.

```
    /* Use the JDK HttpURLConnection (since v1.1) class to do the upload. */
    public void useHttpUrlConnectionToPut(String presignedUrlString, File
 fileToPut, Map<String, String> metadata) {
        logger.info("Begin [{}] upload", fileToPut.toString());
        try {
            URL presignedUrl = new URL(presignedUrlString);
            HttpURLConnection connection = (HttpURLConnection)
 presignedUrl.openConnection();
            connection.setDoOutput(true);
            metadata.forEach((k, v) -> connection.setRequestProperty("x-amz-
meta-" + k, v));
            connection.setRequestMethod("PUT");
            OutputStream out = connection.getOutputStream();

            try (RandomAccessFile file = new RandomAccessFile(fileToPut, "r");
                 FileChannel inChannel = file.getChannel()) {
                ByteBuffer buffer = ByteBuffer.allocate(8192); //Buffer size is
 8k

                while (inChannel.read(buffer) > 0) {
                    buffer.flip();
                    for (int i = 0; i < buffer.limit(); i++) {
                        out.write(buffer.get());
                    }
                    buffer.clear();
                }
            } catch (IOException e) {
                logger.error(e.getMessage(), e);
            }

            out.close();
            connection.getResponseCode();
            logger.info("HTTP response code is " + connection.getResponseCode());

        } catch (S3Exception | IOException e) {
            logger.error(e.getMessage(), e);
        }
    }
```

Use the JDK `HttpClient` (since v11) class to do the upload.

```
   /* Use the JDK HttpClient (since v11) class to do the upload. */
   public void useHttpClientToPut(String presignedUrlString, File fileToPut,
Map<String, String> metadata) {
       logger.info("Begin [{}] upload", fileToPut.toString());

       HttpRequest.Builder requestBuilder = HttpRequest.newBuilder();
       metadata.forEach((k, v) -> requestBuilder.header("x-amz-meta-" + k, v));

       HttpClient httpClient = HttpClient.newHttpClient();
       try {
           final HttpResponse<Void> response = httpClient.send(requestBuilder
                           .uri(new URL(presignedUrlString).toURI())

.PUT(HttpRequest.BodyPublishers.ofFile(Path.of(fileToPut.toURI())))
                           .build(),
                   HttpResponse.BodyHandlers.discarding());

           logger.info("HTTP response code is " + response.statusCode());

       } catch (URISyntaxException | InterruptedException | IOException e) {
           logger.error(e.getMessage(), e);
       }
   }
```

Use the AWS for Java V2 `SdkHttpClient` class to do the upload.

```
   /* Use the AWS SDK for Java V2 SdkHttpClient class to do the upload. */
   public void useSdkHttpClientToPut(String presignedUrlString, File fileToPut,
Map<String, String> metadata) {
       logger.info("Begin [{}] upload", fileToPut.toString());

Create a presigned URL to upload an object to a bucket.

```
import https from "https";
import { PutObjectCommand, S3Client } from "@aws-sdk/client-s3";
import { fromIni } from "@aws-sdk/credential-providers";
import { HttpRequest } from "@smithy/protocol-http";
import {
  getSignedUrl,
  S3RequestPresigner,
} from "@aws-sdk/s3-request-presigner";
import { parseUrl } from "@smithy/url-parser";
import { formatUrl } from "@aws-sdk/util-format-url";
import { Hash } from "@smithy/hash-node";
```

```
const createPresignedUrlWithoutClient = async ({ region, bucket, key }) => {
  const url = parseUrl(`https://${bucket}.s3.${region}.amazonaws.com/${key}`);
  const presigner = new S3RequestPresigner({
    credentials: fromIni(),
    region,
    sha256: Hash.bind(null, "sha256"),
  });

  const signedUrlObject = await presigner.presign(
    new HttpRequest({ ...url, method: "PUT" }),
  );
  return formatUrl(signedUrlObject);
};

const createPresignedUrlWithClient = ({ region, bucket, key }) => {
  const client = new S3Client({ region });
  const command = new PutObjectCommand({ Bucket: bucket, Key: key });
  return getSignedUrl(client, command, { expiresIn: 3600 });
};

function put(url, data) {
  return new Promise((resolve, reject) => {
    const req = https.request(
      url,
      { method: "PUT", headers: { "Content-Length": new Blob([data]).size } },
      (res) => {
        let responseBody = "";
        res.on("data", (chunk) => {
          responseBody += chunk;
        });
        res.on("end", () => {
          resolve(responseBody);
        });
      },
    );
    req.on("error", (err) => {
      reject(err);
    });
    req.write(data);
    req.end();
  });
}
```

```
export const main = async () => {
  const REGION = "us-east-1";
  const BUCKET = "example_bucket";
  const KEY = "example_file.txt";

  // There are two ways to generate a presigned URL.
  // 1. Use createPresignedUrl without the S3 client.
  // 2. Use getSignedUrl in conjunction with the S3 client and GetObjectCommand.
  try {
    const noClientUrl = await createPresignedUrlWithoutClient({
      region: REGION,
      bucket: BUCKET,
      key: KEY,
    });

    const clientUrl = await createPresignedUrlWithClient({
      region: REGION,
      bucket: BUCKET,
      key: KEY,
    });

    // After you get the presigned URL, you can provide your own file
    // data. Refer to put() above.
    console.log("Calling PUT using presigned URL without client");
    await put(noClientUrl, "Hello World");

    console.log("Calling PUT using presigned URL with client");
    await put(clientUrl, "Hello World");

    console.log("\nDone. Check your S3 console.");
  } catch (err) {
    console.error(err);
  }
};
```

Create a presigned URL to download an object from a bucket.

```
import { GetObjectCommand, S3Client } from "@aws-sdk/client-s3";
import { fromIni } from "@aws-sdk/credential-providers";
import { HttpRequest } from "@smithy/protocol-http";
import {
  getSignedUrl,
```

```
  S3RequestPresigner,
} from "@aws-sdk/s3-request-presigner";
import { parseUrl } from "@smithy/url-parser";
import { formatUrl } from "@aws-sdk/util-format-url";
import { Hash } from "@smithy/hash-node";

const createPresignedUrlWithoutClient = async ({ region, bucket, key }) => {
  const url = parseUrl(`https://${bucket}.s3.${region}.amazonaws.com/${key}`);
  const presigner = new S3RequestPresigner({
    credentials: fromIni(),
    region,
    sha256: Hash.bind(null, "sha256"),
  });

  const signedUrlObject = await presigner.presign(new HttpRequest(url));
  return formatUrl(signedUrlObject);
};

const createPresignedUrlWithClient = ({ region, bucket, key }) => {
  const client = new S3Client({ region });
  const command = new GetObjectCommand({ Bucket: bucket, Key: key });
  return getSignedUrl(client, command, { expiresIn: 3600 });
};

export const main = async () => {
  const REGION = "us-east-1";
  const BUCKET = "example_bucket";
  const KEY = "example_file.jpg";

  try {
    const noClientUrl = await createPresignedUrlWithoutClient({
      region: REGION,
      bucket: BUCKET,
      key: KEY,
    });

    const clientUrl = await createPresignedUrlWithClient({
      region: REGION,
      bucket: BUCKET,
      key: KEY,
    });

    console.log("Presigned URL without client");
    console.log(noClientUrl);
```

```
    console.log("\n");

    console.log("Presigned URL with client");
    console.log(clientUrl);
  } catch (err) {
    console.error(err);
  }
};
```

Kotlin

**SDK for Kotlin**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create a `GetObject` presigned request and use the URL to download an object.

```
suspend fun getObjectPresigned(
    s3: S3Client,
    bucketName: String,
    keyName: String,
): String {
    // Create a GetObjectRequest.
    val unsignedRequest =
        GetObjectRequest {
            bucket = bucketName
            key = keyName
        }

    // Presign the GetObject request.
    val presignedRequest = s3.presignGetObject(unsignedRequest, 24.hours)

    // Use the URL from the presigned HttpRequest in a subsequent HTTP GET
 request to retrieve the object.
    val objectContents = URL(presignedRequest.url.toString()).readText()
```

```
    return objectContents
}
```

Create a `GetObject` presigned request with advanced options.

```
suspend fun getObjectPresignedMoreOptions(
    s3: S3Client,
    bucketName: String,
    keyName: String,
): HttpRequest {
    // Create a GetObjectRequest.
    val unsignedRequest =
        GetObjectRequest {
            bucket = bucketName
            key = keyName
        }

    // Presign the GetObject request.
    val presignedRequest =
        s3.presignGetObject(unsignedRequest, signer = CrtAwsSigner) {
            signingDate = Instant.now() + 12.hours // Presigned request can be
 used 12 hours from now.
            algorithm = AwsSigningAlgorithm.SIGV4_ASYMMETRIC
            signatureType = AwsSignatureType.HTTP_REQUEST_VIA_QUERY_PARAMS
            expiresAfter = 8.hours // Presigned request expires 8 hours later.
        }
    return presignedRequest
}
```

Create a `PutObject` presigned request and use it to upload an object.

```
suspend fun putObjectPresigned(
    s3: S3Client,
    bucketName: String,
    keyName: String,
    content: String,
) {
    // Create a PutObjectRequest.
    val unsignedRequest =
        PutObjectRequest {
```

```
            bucket = bucketName
            key = keyName
        }

    // Presign the request.
    val presignedRequest = s3.presignPutObject(unsignedRequest, 24.hours)

    // Use the URL and any headers from the presigned HttpRequest in a subsequent
 HTTP PUT request to retrieve the object.
    // Create a PUT request using the OKHttpClient API.
    val putRequest =
        Request
            .Builder()
            .url(presignedRequest.url.toString())
            .apply {
                presignedRequest.headers.forEach { key, values ->
                    header(key, values.joinToString(", "))
                }
            }.put(content.toRequestBody())
            .build()

    val response = OkHttpClient().newCall(putRequest).execute()
    assert(response.isSuccessful)
}
```

Create presigning requests to GET and PUT S3 objects.

```
async fn get_object(
    client: &Client,
    bucket: &str,
    object: &str,
    expires_in: u64,
) -> Result<(), Box<dyn Error>> {
    let expires_in = Duration::from_secs(expires_in);
    let presigned_request = client
        .get_object()
        .bucket(bucket)
        .key(object)
        .presigned(PresigningConfig::expires_in(expires_in)?)
        .await?;

    println!("Object URI: {}", presigned_request.uri());

    Ok(())
}

async fn put_object(
    client: &Client,
    bucket: &str,
    object: &str,
    expires_in: u64,
) -> Result<(), Box<dyn Error>> {
    let expires_in = Duration::from_secs(expires_in);

    let presigned_request = client
        .put_object()
        .bucket(bucket)
        .key(object)
        .presigned(PresigningConfig::expires_in(expires_in)?)
        .await?;

    println!("Object URI: {}", presigned_request.uri());

    Ok(())
}
```

## A web page that lists Amazon S3 objects using an AWS SDK

The following code example shows how to list Amazon S3 objects in a web page.

JavaScript

**SDK for JavaScript (v3)**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

The following code is the relevant React component that makes calls to the AWS SDK. A runnable version of the application containing this component can be found at the preceding GitHub link.

```
import { useEffect, useState } from "react";
import {
  ListObjectsCommand,
  ListObjectsCommandOutput,
  S3Client,
} from "@aws-sdk/client-s3";
import { fromCognitoIdentityPool } from "@aws-sdk/credential-providers";
import "./App.css";

function App() {
  const [objects, setObjects] = useState<
    Required<ListObjectsCommandOutput>["Contents"]
  >([]);

  useEffect(() => {
    const client = new S3Client({
      region: "us-east-1",
      // Unless you have a public bucket, you'll need access to a private bucket.
      // One way to do this is to create an Amazon Cognito identity pool, attach
 a role to the pool,
```

```
      // and grant the role access to the 's3:GetObject' action.
      //
      // You'll also need to configure the CORS settings on the bucket to allow
 traffic from
      // this example site. Here's an example configuration that allows all
 origins. Don't
      // do this in production.
      //[
      //  {
      //    "AllowedHeaders": ["*"],
      //    "AllowedMethods": ["GET"],
      //    "AllowedOrigins": ["*"],
      //    "ExposeHeaders": [],
      //  },
      //]
      //
      credentials: fromCognitoIdentityPool({
        clientConfig: { region: "us-east-1" },
        identityPoolId: "<YOUR_IDENTITY_POOL_ID>",
      }),
    });
    const command = new ListObjectsCommand({ Bucket: "bucket-name" });
    client.send(command).then(({ Contents }) => setObjects(Contents || []));
  }, []);

  return (
    <div className="App">
      {objects.map((o) => (
        <div key={o.ETag}>{o.Key}</div>
      ))}
    </div>
  );
}

export default App;
```

- For API details, see ListObjects in *AWS SDK for JavaScript API Reference*.

# Delete incomplete multipart uploads to Amazon S3 using an AWS SDK

The following code example shows how to how to delete or stop incomplete Amazon S3 multipart uploads.

Java

### SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

To stop multipart uploads that are in-progress or incomplete for any reason, you can get a list uploads and then delete them as shown in the following example.

```
   public static void abortIncompleteMultipartUploadsFromList() {
       ListMultipartUploadsRequest listMultipartUploadsRequest =
ListMultipartUploadsRequest.builder()
               .bucket(bucketName)
               .build();

       ListMultipartUploadsResponse response =
s3Client.listMultipartUploads(listMultipartUploadsRequest);
       List<MultipartUpload> uploads = response.uploads();

       AbortMultipartUploadRequest abortMultipartUploadRequest;
       for (MultipartUpload upload : uploads) {
           abortMultipartUploadRequest = AbortMultipartUploadRequest.builder()
                   .bucket(bucketName)
                   .key(upload.key())
                   .expectedBucketOwner(accountId)
                   .uploadId(upload.uploadId())
                   .build();

           AbortMultipartUploadResponse abortMultipartUploadResponse =
s3Client.abortMultipartUpload(abortMultipartUploadRequest);
           if (abortMultipartUploadResponse.sdkHttpResponse().isSuccessful()) {
               logger.info("Upload ID [{}] to bucket [{}] successfully
aborted.", upload.uploadId(), bucketName);
```

```
            }
        }
    }
```

To delete incomplete multipart uploads that were initiated before or after a date, you can selectively delete multipart uploads based on a point in time as shown in the following example.

```
    static void abortIncompleteMultipartUploadsOlderThan(Instant pointInTime) {
        ListMultipartUploadsRequest listMultipartUploadsRequest =
ListMultipartUploadsRequest.builder()
                .bucket(bucketName)
                .build();

        ListMultipartUploadsResponse response =
s3Client.listMultipartUploads(listMultipartUploadsRequest);
        List<MultipartUpload> uploads = response.uploads();

        AbortMultipartUploadRequest abortMultipartUploadRequest;
        for (MultipartUpload upload : uploads) {
            logger.info("Found multipartUpload with upload ID [{}], initiated
[{}]", upload.uploadId(), upload.initiated());
            if (upload.initiated().isBefore(pointInTime)) {
                abortMultipartUploadRequest =
AbortMultipartUploadRequest.builder()
                        .bucket(bucketName)
                        .key(upload.key())
                        .expectedBucketOwner(accountId)
                        .uploadId(upload.uploadId())
                        .build();

                AbortMultipartUploadResponse abortMultipartUploadResponse =
s3Client.abortMultipartUpload(abortMultipartUploadRequest);
                if
(abortMultipartUploadResponse.sdkHttpResponse().isSuccessful()) {
                    logger.info("Upload ID [{}] to bucket [{}] successfully
aborted.", upload.uploadId(), bucketName);
                }
            }
        }
    }
```

If you have access to the upload ID after you begin a multipart upload, you can delete the in-progress upload by using the ID.

```
    static void abortMultipartUploadUsingUploadId() {
        String uploadId = startUploadReturningUploadId();
        AbortMultipartUploadResponse response = s3Client.abortMultipartUpload(b -
> b
                .uploadId(uploadId)
                .bucket(bucketName)
                .key(key));

        if (response.sdkHttpResponse().isSuccessful()) {
            logger.info("Upload ID [{}] to bucket [{}] successfully aborted.",
 uploadId, bucketName);
        }
    }
```

To consistently delete incomplete multipart uploads older that a certain number of days, set up a bucket lifecycle configuration for the bucket. The following example shows how to create a rule to delete incomplete uploads older than 7 days.

```
    static void abortMultipartUploadsUsingLifecycleConfig() {
        Collection<LifecycleRule> lifeCycleRules =
 List.of(LifecycleRule.builder()
                .abortIncompleteMultipartUpload(b -> b.
                        daysAfterInitiation(7))
                .status("Enabled")
                .filter(SdkBuilder::build) // Filter element is required.
                .build());

        // If the action is successful, the service sends back an HTTP 200
 response with an empty HTTP body.
        PutBucketLifecycleConfigurationResponse response =
 s3Client.putBucketLifecycleConfiguration(b -> b
                .bucket(bucketName)
                .lifecycleConfiguration(b1 -> b1.rules(lifeCycleRules)));

        if (response.sdkHttpResponse().isSuccessful()) {
```

```
            logger.info("Rule to abort incomplete multipart uploads added to
bucket.");
        } else {
            logger.error("Unsuccessfully applied rule. HTTP status code is [{}]",
response.sdkHttpResponse().statusCode());
        }
    }
```

# Get an Amazon S3 object from a Multi-Region Access Point by using an AWS SDK

The following code example shows how to get an object from a Multi-Region Access Point.

Kotlin

### SDK for Kotlin

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Configure the S3 client to use the Asymmetric Sigv4 (Sigv4a) signing algorithm.

```
        suspend fun createS3Client(): S3Client {
            // Configure your S3Client to use the Asymmetric Sigv4 (Sigv4a)
signing algorithm.
            val sigV4AScheme = SigV4AsymmetricAuthScheme(CrtAwsSigner)
            val s3 = S3Client.fromEnvironment {
                authSchemes = listOf(sigV4AScheme)
            }
            return s3
        }
```

Use the Multi-Region Access Point ARN instead of a bucket name to retrieve the object.

```
    suspend fun getObjectFromMrap(
        s3: S3Client,
        mrapArn: String,
        keyName: String,
    ): String? {
        val request = GetObjectRequest {
            bucket = mrapArn // Use the ARN instead of the bucket name for object
operations.
            key = keyName
        }
```

```
        var stringObj: String? = null
        s3.getObject(request) { resp ->
            stringObj = resp.body?.decodeToString()
            if (stringObj != null) {
                println("Successfully read $keyName from $mrapArn")
            }
        }
        return stringObj
    }
```

- For more information, see AWS SDK for Kotlin developer guide.
- For API details, see GetObject in *AWS SDK for Kotlin API reference*.

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Get an object from an Amazon S3 bucket using an AWS SDK, specifying an If-Modified-Since header

The following code example shows how to read data from an object in an S3 bucket, but only if that bucket has not been modified since the last retrieval time.

Rust

**SDK for Rust**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
use aws_sdk_s3::{
    error::SdkError,
    operation::head_object::HeadObjectError,
    primitives::{ByteStream, DateTime, DateTimeFormat},
    Client, Error,
};
```

```
use tracing::{error, warn};

const KEY: &str = "key";
const BODY: &str = "Hello, world!";

/// Demonstrate how `if-modified-since` reports that matching objects haven't
/// changed.
///
/// # Steps
/// - Create a bucket.
/// - Put an object in the bucket.
/// - Get the bucket headers.
/// - Get the bucket headers again but only if modified.
/// - Delete the bucket.
#[tokio::main]
async fn main() -> Result<(), Error> {
    tracing_subscriber::fmt::init();

    // Get a new UUID to use when creating a unique bucket name.
    let uuid = uuid::Uuid::new_v4();

    // Load the AWS configuration from the environment.
    let client = Client::new(&aws_config::load_from_env().await);

    // Generate a unique bucket name using the previously generated UUID.
    // Then create a new bucket with that name.
    let bucket_name = format!("if-modified-since-{uuid}");
    client
        .create_bucket()
        .bucket(bucket_name.clone())
        .send()
        .await?;

    // Create a new object in the bucket whose name is `KEY` and whose
    // contents are `BODY`.
    let put_object_output = client
        .put_object()
        .bucket(bucket_name.as_str())
        .key(KEY)
        .body(ByteStream::from_static(BODY.as_bytes()))
        .send()
        .await;

    // If the `PutObject` succeeded, get the eTag string from it. Otherwise,
```

```
    // report an error and return an empty string.
    let e_tag_1 = match put_object_output {
        Ok(put_object) => put_object.e_tag.unwrap(),
        Err(err) => {
            error!("{err:?}");

## Get started with Amazon S3 buckets and objects using an AWS SDK

The following code examples show how to:

- Create a bucket and upload a file to it.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the bucket objects and the bucket.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
public class S3_Basics
{
    public static async Task Main()
    {
        // Create an Amazon S3 client object. The constructor uses the
        // default user installed on the system. To work with Amazon S3
        // features in a different AWS Region, pass the AWS Region as a
        // parameter to the client constructor.
        IAmazonS3 client = new AmazonS3Client();
        string bucketName = string.Empty;
        string filePath = string.Empty;
        string keyName = string.Empty;

        var sepBar = new string('-', Console.WindowWidth);
```

```
            Console.WriteLine(sepBar);
            Console.WriteLine("Amazon Simple Storage Service (Amazon S3) basic");
            Console.WriteLine("procedures. This application will:");
            Console.WriteLine("\n\t1. Create a bucket");
            Console.WriteLine("\n\t2. Upload an object to the new bucket");
            Console.WriteLine("\n\t3. Copy the uploaded object to a folder in the
 bucket");
            Console.WriteLine("\n\t4. List the items in the new bucket");
            Console.WriteLine("\n\t5. Delete all the items in the bucket");
            Console.WriteLine("\n\t6. Delete the bucket");
            Console.WriteLine(sepBar);

            // Create a bucket.
            Console.WriteLine($"\n{sepBar}");
            Console.WriteLine("\nCreate a new Amazon S3 bucket.\n");
            Console.WriteLine(sepBar);

Run an interactive scenario that shows you how work with S3 buckets and objects.

```
// RunGetStartedScenario is an interactive example that shows you how to use
 Amazon
// Simple Storage Service (Amazon S3) to create an S3 bucket and use it to store
 objects.
//
// 1. Create a bucket.
// 2. Upload a local file to the bucket.
// 3. Upload a large object to the bucket by using an upload manager.
// 4. Download an object to a local file.
// 5. Download a large object by using a download manager.
// 6. Copy an object to a different folder in the bucket.
// 7. List objects in the bucket.
// 8. Delete all objects in the bucket.
// 9. Delete the bucket.
//
// This example creates an Amazon S3 service client from the specified sdkConfig
 so that
// you can replace it with a mocked or stubbed config for unit testing.
//
// It uses a questioner from the `demotools` package to get input during the
 example.
// This package can be found in the ..\..\demotools folder of this repo.
```

```

Java

**SDK for Java 2.x**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
```

```
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-
started.html
 *
 * This Java code example performs the following tasks:
 *
 * 1. Creates an Amazon S3 bucket.
 * 2. Uploads an object to the bucket.
 * 3. Downloads the object to another local file.
 * 4. Uploads an object using multipart upload.
 * 5. List all objects located in the Amazon S3 bucket.
 * 6. Copies the object to another Amazon S3 bucket.
 * 7. Deletes the object from the Amazon S3 bucket.
 * 8. Deletes the Amazon S3 bucket.

JavaScript

### SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

First, import all the necessary modules.

```
// Used to check if currently running file is this file.
import { fileURLToPath } from "url";
import { readdirSync, readFileSync, writeFileSync } from "fs";

// Local helper utils.
import { dirnameFromMetaUrl } from "@aws-doc-sdk-examples/lib/utils/util-fs.js";
import { Prompter } from "@aws-doc-sdk-examples/lib/prompter.js";
import { wrapText } from "@aws-doc-sdk-examples/lib/utils/util-string.js";

import {
  S3Client,
  CreateBucketCommand,
  PutObjectCommand,
  ListObjectsCommand,
  CopyObjectCommand,
  GetObjectCommand,
  DeleteObjectsCommand,
  DeleteBucketCommand,
} from "@aws-sdk/client-s3";
```

The preceding imports reference some helper utilities. These utilities are local to the GitHub repository linked at the start of this section. For your reference, see the following implementations of those utilities.

```
export const dirnameFromMetaUrl = (metaUrl) =>
  fileURLToPath(new URL(".", metaUrl));

import { select, input, confirm, checkbox } from "@inquirer/prompts";
```

```
export class Prompter {
  /**
   * @param {{ message: string, choices: { name: string, value: string }[]}}
 options
   */
  select(options) {
    return select(options);
  }

  /**
   * @param {{ message: string }} options
   */
  input(options) {
    return input(options);
  }

  /**
   * @param {string} prompt
   */
  checkContinue = async (prompt = "") => {
    const prefix = prompt && prompt + " ";
    let ok = await this.confirm({
      message: `${prefix}Continue?`,
    });
    if (!ok) throw new Error("Exiting...");
  };

  /**
   * @param {{ message: string }} options
   */
  confirm(options) {
    return confirm(options);
  }

  /**
   * @param {{ message: string, choices: { name: string, value: string }[]}}
 options
   */
  checkbox(options) {
    return checkbox(options);
  }
}

export const wrapText = (text, char = "=") => {
```

```
  const rule = char.repeat(80);
  return `${rule}\n    ${text}\n${rule}\n`;
};
```

Objects in S3 are stored in 'buckets'. Let's define a function for creating a new bucket.

```
export const createBucket = async () => {
  const bucketName = await prompter.input({
    message: "Enter a bucket name. Bucket names must be globally unique:",
  });
  const command = new CreateBucketCommand({ Bucket: bucketName });
  await s3Client.send(command);
  console.log("Bucket created successfully.\n");
  return bucketName;
};
```

Buckets contain 'objects'. This function uploads the contents of a directory to your bucket as objects.

```
export const uploadFilesToBucket = async ({ bucketName, folderPath }) => {
  console.log(`Uploading files from ${folderPath}\n`);
  const keys = readdirSync(folderPath);
  const files = keys.map((key) => {
    const filePath = `${folderPath}/${key}`;
    const fileContent = readFileSync(filePath);
    return {
      Key: key,
      Body: fileContent,
    };
  });

  for (let file of files) {
    await s3Client.send(
      new PutObjectCommand({
        Bucket: bucketName,
        Body: file.Body,
        Key: file.Key,
      }),
    );
    console.log(`${file.Key} uploaded successfully.`);
  }
```

```
};
```

After uploading objects, check to confirm that they were uploaded correctly. You can use ListObjects for that. You'll be using the 'Key' property, but there are other useful properties in the response also.

```
export const listFilesInBucket = async ({ bucketName }) => {
  const command = new ListObjectsCommand({ Bucket: bucketName });
  const { Contents } = await s3Client.send(command);
  const contentsList = Contents.map((c) => ` • ${c.Key}`).join("\n");
  console.log("\nHere's a list of files in the bucket:");
  console.log(contentsList + "\n");
};
```

Sometimes you might want to copy an object from one bucket to another. Use the CopyObject command for that.

```
export const copyFileFromBucket = async ({ destinationBucket }) => {
  const proceed = await prompter.confirm({
    message: "Would you like to copy an object from another bucket?",
  });

  if (!proceed) {
    return;
  } else {
    const copy = async () => {
      try {
        const sourceBucket = await prompter.input({
          message: "Enter source bucket name:",
        });
        const sourceKey = await prompter.input({
          message: "Enter source key:",
        });
        const destinationKey = await prompter.input({
          message: "Enter destination key:",
        });

        const command = new CopyObjectCommand({
          Bucket: destinationBucket,
          CopySource: `${sourceBucket}/${sourceKey}`,
```

```
          Key: destinationKey,
        });
        await s3Client.send(command);
        await copyFileFromBucket({ destinationBucket });
      } catch (err) {
        console.error(`Copy error.`);
        console.error(err);
        const retryAnswer = await prompter.confirm({ message: "Try again?" });
        if (retryAnswer) {
          await copy();
        }
      }
    };
    await copy();
  }
};
```

There's no SDK method for getting multiple objects from a bucket. Instead, you'll create a list of objects to download and iterate over them.

```
export const downloadFilesFromBucket = async ({ bucketName }) => {
  const { Contents } = await s3Client.send(
    new ListObjectsCommand({ Bucket: bucketName }),
  );
  const path = await prompter.input({
    message: "Enter destination path for files:",
  });

  for (let content of Contents) {
    const obj = await s3Client.send(
      new GetObjectCommand({ Bucket: bucketName, Key: content.Key }),
    );
    writeFileSync(
      `${path}/${content.Key}`,
      await obj.Body.transformToByteArray(),
    );
  }
  console.log("Files downloaded successfully.\n");
};
```

It's time to clean up your resources. A bucket must be empty before it can be deleted. These two functions empty and delete the bucket.

```
export const emptyBucket = async ({ bucketName }) => {
  const listObjectsCommand = new ListObjectsCommand({ Bucket: bucketName });
  const { Contents } = await s3Client.send(listObjectsCommand);
  const keys = Contents.map((c) => c.Key);

  const deleteObjectsCommand = new DeleteObjectsCommand({
    Bucket: bucketName,
    Delete: { Objects: keys.map((key) => ({ Key: key })) },
  });
  await s3Client.send(deleteObjectsCommand);
  console.log(`${bucketName} emptied successfully.\n`);
};

export const deleteBucket = async ({ bucketName }) => {
  const command = new DeleteBucketCommand({ Bucket: bucketName });
  await s3Client.send(command);
  console.log(`${bucketName} deleted successfully.\n`);
};
```

The 'main' function pulls everything together. If you run this file directly the main function will be called.

```
const main = async () => {
  const OBJECT_DIRECTORY = `${dirnameFromMetaUrl(
    import.meta.url,
  )}../../../../resources/sample_files/.sample_media`;

  try {
    console.log(wrapText("Welcome to the Amazon S3 getting started example."));
    console.log("Let's create a bucket.");
    const bucketName = await createBucket();
    await prompter.confirm({ message: continueMessage });

    console.log(wrapText("File upload."));
    console.log(
      "I have some default files ready to go. You can edit the source code to
 provide your own.",
    );
    await uploadFilesToBucket({
```

```
      bucketName,
      folderPath: OBJECT_DIRECTORY,
    });

    await listFilesInBucket({ bucketName });
    await prompter.confirm({ message: continueMessage });

    console.log(wrapText("Copy files."));
    await copyFileFromBucket({ destinationBucket: bucketName });
    await listFilesInBucket({ bucketName });
    await prompter.confirm({ message: continueMessage });

    console.log(wrapText("Download files."));
    await downloadFilesFromBucket({ bucketName });

    console.log(wrapText("Clean up."));
    await emptyBucket({ bucketName });
    await deleteBucket({ bucketName });
  } catch (err) {
    console.error(err);
  }
};
```

## Get the legal hold configuration of an Amazon S3 object using an AWS SDK

The following code examples show how to get the legal hold configuration of an S3 bucket.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    /// <summary>
    /// Get the legal hold details for an S3 object.
    /// </summary>
    /// <param name="bucketName">The bucket of the object.</param>
    /// <param name="objectKey">The object key.</param>
    /// <returns>The object legal hold details.</returns>
```

```
    public async Task<ObjectLockLegalHold> GetObjectLegalHold(string bucketName,
        string objectKey)
    {
        try
        {
            var request = new GetObjectLegalHoldRequest()
            {
                BucketName = bucketName,
                Key = objectKey
            };

            var response = await _amazonS3.GetObjectLegalHoldAsync(request);
            Console.WriteLine($"\tObject legal hold for {objectKey} in
{bucketName}: " +
                              $"\n\tStatus: {response.LegalHold.Status}");
            return response.LegalHold;
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine($"\tUnable to fetch legal hold: '{ex.Message}'");
            return new ObjectLockLegalHold();
        }
    }
```

- For API details, see GetObjectLegalHold in *AWS SDK for .NET API Reference*.

Java

**SDK for Java 2.x**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    // Get the legal hold details for an S3 object.
    public ObjectLockLegalHold getObjectLegalHold(String bucketName, String
objectKey) {
        try {
```

```
            GetObjectLegalHoldRequest legalHoldRequest =
GetObjectLegalHoldRequest.builder()
                .bucket(bucketName)
                .key(objectKey)
                .build();

            GetObjectLegalHoldResponse response =
getClient().getObjectLegalHold(legalHoldRequest);
            System.out.println("Object legal hold for " + objectKey + " in " +
bucketName +
                ":\n\tStatus: " + response.legalHold().status());
            return response.legalHold();

        } catch (S3Exception ex) {
            System.out.println("\tUnable to fetch legal hold: '" +
ex.getMessage() + "'");
        }

        return null;
    }
```

## Work with Amazon S3 object lock features using an AWS SDK

The following code examples show how to work with S3 object lock features.

.NET

### AWS SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Run an interactive scenario demonstrating Amazon S3 object lock features.

```
using Amazon.S3;
using Amazon.S3.Model;
using Microsoft.Extensions.Configuration;
using Microsoft.Extensions.DependencyInjection;
using Microsoft.Extensions.Hosting;
using Microsoft.Extensions.Logging;
using Microsoft.Extensions.Logging.Console;
using Microsoft.Extensions.Logging.Debug;

namespace S3ObjectLockScenario;

public static class S3ObjectLockWorkflow
{
    /*
    Before running this .NET code example, set up your development environment,
 including your credentials.

    This .NET example performs the following tasks:
        1. Create test Amazon Simple Storage Service (S3) buckets with different
 lock policies.
        2. Upload sample objects to each bucket.
        3. Set some Legal Hold and Retention Periods on objects and buckets.
        4. Investigate lock policies by viewing settings or attempting to delete
 or overwrite objects.
        5. Clean up objects and buckets.
   */

> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Run an interactive scenario demonstrating Amazon S3 object lock features.

```
import software.amazon.awssdk.services.s3.model.ObjectLockLegalHold;
import software.amazon.awssdk.services.s3.model.ObjectLockRetention;
import java.io.BufferedWriter;
import java.io.IOException;
import java.time.LocalDateTime;
import java.time.format.DateTimeFormatter;
import java.util.ArrayList;
import java.util.List;
import java.util.Scanner;
```

```
import java.util.stream.Collectors;

/*
 Before running this Java V2 code example, set up your development
 environment, including your credentials.

 For more information, see the following documentation topic:
 https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/setup.html

 This Java example performs the following tasks:
    1. Create test Amazon Simple Storage Service (S3) buckets with different lock
 policies.
    2. Upload sample objects to each bucket.
    3. Set some Legal Hold and Retention Periods on objects and buckets.
    4. Investigate lock policies by viewing settings or attempting to delete or
 overwrite objects.
    5. Clean up objects and buckets.

# Manage access control lists (ACLs) for Amazon S3 buckets using an AWS SDK

The following code example shows how to manage access control lists (ACLs) for Amazon S3 buckets.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

            };

            // Create a new ACL.
            var newAcl = new S3AccessControlList
            {
                Grants = new List<S3Grant> { grantUsingEmail,
 grantLogDeliveryGroup },
                Owner = owner,
            };

            // Set the new ACL. We're throwing away the response here.
            _ = await client.PutACLAsync(new PutACLRequest
            {
                BucketName = bucketName,
                Key = keyName,
                AccessControlList = newAcl,
            });
        }

    }
```

## Manage versioned Amazon S3 objects in batches with a Lambda function using an AWS SDK

The following code example shows how to manage versioned S3 objects in batches with a Lambda function.

Python

**SDK for Python (Boto3)**

Shows how to manipulate Amazon Simple Storage Service (Amazon S3) versioned objects in batches by creating jobs that call AWS Lambda functions to perform processing. This example creates a version-enabled bucket, uploads the stanzas from the poem *You Are Old, Father William* by Lewis Carroll, and uses Amazon S3 batch jobs to twist the poem in various ways.

**Learn how to:**

- Create Lambda functions that operate on versioned objects.
- Create a manifest of objects to update.
- Create batch jobs that invoke Lambda functions to update objects.
- Delete Lambda functions.
- Empty and delete a versioned bucket.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon S3

## Parse Amazon S3 URIs using an AWS SDK

The following code example shows how to parse Amazon S3 URIs to extract important components like the bucket name and object key.

Java

**SDK for Java 2.x**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Parse an Amazon S3 URI by using the S3Uri class.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.S3Uri;
import software.amazon.awssdk.services.s3.S3Utilities;

import java.net.URI;
import java.util.List;
import java.util.Map;

    /**
     *
```

```
     * @param s3Client    - An S3Client through which you acquire an S3Uri
 instance.
     * @param s3ObjectUrl - A complex URL (String) that is used to demonstrate
 S3Uri
     *                     capabilities.
     */
    public static void parseS3UriExample(S3Client s3Client, String s3ObjectUrl) {
        logger.info(s3ObjectUrl);
        // Console output:
        // 'https://s3.us-west-1.amazonaws.com/myBucket/resources/doc.txt?
versionId=abc123&partNumber=77&partNumber=88'.

        // Create an S3Utilities object using the configuration of the s3Client.
        S3Utilities s3Utilities = s3Client.utilities();

        // From a String URL create a URI object to pass to the parseUri()
 method.
        URI uri = URI.create(s3ObjectUrl);
        S3Uri s3Uri = s3Utilities.parseUri(uri);

        // If the URI contains no value for the Region, bucket or key, the SDK
 returns
        // an empty Optional.
        // The SDK returns decoded URI values.

        Region region = s3Uri.region().orElse(null);
        log("region", region);
        // Console output: 'region: us-west-1'.

        String bucket = s3Uri.bucket().orElse(null);

## Perform a multipart upload of an Amazon S3 object using an AWS SDK

The following code example shows how to perform a multipart upload to an Amazon S3 object.

Java

**SDK for Java 2.x**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

The code examples use the following imports.

```
import org.slf4j.Logger;
```

```
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.core.sync.RequestBody;
import software.amazon.awssdk.services.s3.S3AsyncClient;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.CompletedMultipartUpload;
import software.amazon.awssdk.services.s3.model.CompletedPart;
import software.amazon.awssdk.services.s3.model.CreateMultipartUploadResponse;
import software.amazon.awssdk.services.s3.model.PutObjectResponse;
import software.amazon.awssdk.services.s3.model.UploadPartRequest;
import software.amazon.awssdk.services.s3.model.UploadPartResponse;
import software.amazon.awssdk.services.s3.waiters.S3Waiter;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.FileUpload;
import software.amazon.awssdk.transfer.s3.model.UploadFileRequest;

import java.io.IOException;
import java.io.RandomAccessFile;
import java.net.URISyntaxException;
import java.net.URL;
import java.nio.ByteBuffer;
import java.nio.file.Paths;
import java.util.ArrayList;
import java.util.List;
import java.util.Objects;
import java.util.UUID;
import java.util.concurrent.CompletableFuture;
```

Use the S3 Transfer Manager on top of the AWS CRT-based S3 client to transparently perform a multipart upload when the size of the content exceeds a threshold. The default threshold size is 8 MB.

```
    public void multipartUploadWithTransferManager(String filePath) {
        S3TransferManager transferManager = S3TransferManager.create();
        UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
                .putObjectRequest(b -> b
                        .bucket(bucketName)
                        .key(key))
                .source(Paths.get(filePath))
                .build();
        FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);
        fileUpload.completionFuture().join();
```

```
        transferManager.close();
    }
```

Use the S3Client API to perform a multipart upload.

```
    public void multipartUploadWithS3Client(String filePath) {

        // Initiate the multipart upload.
        CreateMultipartUploadResponse createMultipartUploadResponse =
s3Client.createMultipartUpload(b -> b
                .bucket(bucketName)
                .key(key));
        String uploadId = createMultipartUploadResponse.uploadId();

        // Upload the parts of the file.
        int partNumber = 1;
        List<CompletedPart> completedParts = new ArrayList<>();
        ByteBuffer bb = ByteBuffer.allocate(1024 * 1024 * 5); // 5 MB byte buffer

        try (RandomAccessFile file = new RandomAccessFile(filePath, "r")) {
            long fileSize = file.length();
            long position = 0;
            while (position < fileSize) {
                file.seek(position);
                long read = file.getChannel().read(bb);

                bb.flip(); // Swap position and limit before reading from the
buffer.
                UploadPartRequest uploadPartRequest = UploadPartRequest.builder()
                        .bucket(bucketName)
                        .key(key)
                        .uploadId(uploadId)
                        .partNumber(partNumber)
                        .build();

                UploadPartResponse partResponse = s3Client.uploadPart(
                        uploadPartRequest,
                        RequestBody.fromByteBuffer(bb));

                CompletedPart part = CompletedPart.builder()
                        .partNumber(partNumber)
                        .eTag(partResponse.eTag())
```

```
                        .build();
                completedParts.add(part);

                bb.clear();
                position += read;
                partNumber++;
            }
        } catch (IOException e) {
            logger.error(e.getMessage());
        }

        // Complete the multipart upload.
        s3Client.completeMultipartUpload(b -> b
                .bucket(bucketName)
                .key(key)
                .uploadId(uploadId)

.multipartUpload(CompletedMultipartUpload.builder().parts(completedParts).build()));
    }
```

Use the S3AsyncClient API with multipart support enabled to perform a multipart upload.

```
    public void multipartUploadWithS3AsyncClient(String filePath) {
        // Enable multipart support.
        S3AsyncClient s3AsyncClient = S3AsyncClient.builder()
                .multipartEnabled(true)
                .build();

        CompletableFuture<PutObjectResponse> response = s3AsyncClient.putObject(b
-> b
                        .bucket(bucketName)
                        .key(key),
                Paths.get(filePath));

        response.join();
        logger.info("File uploaded in multiple 8 MiB parts using
S3AsyncClient.");
    }
```

## Receive and process Amazon S3 event notifications by using an AWS SDK.

The following code example shows how to work with S3 event notifications in an object-oriented way.

Java

**SDK for Java 2.x**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

This example show how to process S3 notification event by using Amazon SQS.

```
    /**
     * This method receives S3 event notifications by using an SqsAsyncClient.
     * After the client receives the messages it deserializes the JSON payload
 and logs them. It uses
     * the S3EventNotification class (part of the S3 event notification API for
 Java) to deserialize
     * the JSON payload and access the messages in an object-oriented way.
     *
     * @param queueUrl The URL of the AWS SQS queue that receives the S3 event
 notifications.
     * @see <a href="https://sdk.amazonaws.com/java/api/latest/software/amazon/
awssdk/eventnotifications/s3/model/package-summary.html">S3EventNotification
 API</a>.
```

```
    * <p>
    * To use S3 event notification serialization/deserialization to objects, add
the following
    * dependency to your Maven pom.xml file.
    * <dependency>
    * <groupId>software.amazon.awssdk</groupId>
    * <artifactId>s3-event-notifications</artifactId>
    * <version><LATEST></version>
    * </dependency>
    * <p>
    * The S3 event notification API became available with version 2.25.11 of the
Java SDK.
    * <p>
    * This example shows the use of the API with AWS SQS, but it can be used to
process S3 event notifications
    * in AWS SNS or AWS Lambda as well.
    * <p>
    * Note: The S3EventNotification class does not work with messages routed
through AWS EventBridge.
    */
   static void processS3Events(String bucketName, String queueUrl, String
queueArn) {
       try {
           // Configure the bucket to send Object Created and Object Tagging
notifications to an existing SQS queue.
           s3Client.putBucketNotificationConfiguration(b -> b
                   .notificationConfiguration(ncb -> ncb
                           .queueConfigurations(qcb -> qcb
                                   .events(Event.S3_OBJECT_CREATED,
Event.S3_OBJECT_TAGGING)
                                   .queueArn(queueArn)))

## Send S3 event notifications to Amazon EventBridge using an AWS SDK

The following code example shows how to enable a bucket to send S3 event notifications to EventBridge and route notifications to an Amazon SNS topic and Amazon SQS queue.

Java

### SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
   /** This method configures a bucket to send events to AWS EventBridge and
creates a rule
    * to route the S3 object created events to a topic and a queue.
    *
    * @param bucketName Name of existing bucket
    * @param topicArn ARN of existing topic to receive S3 event notifications
    * @param queueArn ARN of existing queue to receive S3 event notifications
    *
    *  An AWS CloudFormation stack sets up the bucket, queue, topic before the
method runs.
    */
   public static String setBucketNotificationToEventBridge(String bucketName,
String topicArn, String queueArn) {
       try {
           // Enable bucket to emit S3 Event notifications to EventBridge.
           s3Client.putBucketNotificationConfiguration(b -> b
                   .bucket(bucketName)
                   .notificationConfiguration(b1 -> b1

## Track an Amazon S3 object upload or download using an AWS SDK

The following code example shows how to track an Amazon S3 object upload or download.

Java

**SDK for Java 2.x**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Track the progress of a file upload.

```
   public void trackUploadFile(S3TransferManager transferManager, String
bucketName,
                               String key, URI filePathURI) {
       UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
               .putObjectRequest(b -> b.bucket(bucketName).key(key))
               .addTransferListener(LoggingTransferListener.create())  // Add
listener.
               .source(Paths.get(filePathURI))
               .build();

       FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);

       fileUpload.completionFuture().join();
       /*
```

```
            The SDK provides a LoggingTransferListener implementation of the
TransferListener interface.
            You can also implement the interface to provide your own logic.

            Configure log4J2 with settings such as the following.
                <Configuration status="WARN">
                    <Appenders>
                        <Console name="AlignedConsoleAppender"
target="SYSTEM_OUT">
                            <PatternLayout pattern="%m%n"/>
                        </Console>
                    </Appenders>

                    <Loggers>
                        <logger
name="software.amazon.awssdk.transfer.s3.progress.LoggingTransferListener"
level="INFO" additivity="false">
                            <AppenderRef ref="AlignedConsoleAppender"/>
                        </logger>
                    </Loggers>
                </Configuration>

            Log4J2 logs the progress. The following is example output for a 21.3
MB file upload.
                Transfer initiated...
                |                    | 0.0%
                |====                | 21.1%
                |============        | 60.5%
                |====================| 100.0%
                Transfer complete!
        */
    }
```

Track the progress of a file download.

```
    public void trackDownloadFile(S3TransferManager transferManager, String
bucketName,
                              String key, String downloadedFileWithPath) {
        DownloadFileRequest downloadFileRequest = DownloadFileRequest.builder()
                .getObjectRequest(b -> b.bucket(bucketName).key(key))
                .addTransferListener(LoggingTransferListener.create())  // Add
listener.
```

```
                .destination(Paths.get(downloadedFileWithPath))
                .build();

        FileDownload downloadFile =
transferManager.downloadFile(downloadFileRequest);

        CompletedFileDownload downloadResult =
downloadFile.completionFuture().join();
        /*
            The SDK provides a LoggingTransferListener implementation of the
TransferListener interface.
            You can also implement the interface to provide your own logic.

            Configure log4J2 with settings such as the following.
                <Configuration status="WARN">
                    <Appenders>
                        <Console name="AlignedConsoleAppender"
target="SYSTEM_OUT">
                            <PatternLayout pattern="%m%n"/>
                        </Console>
                    </Appenders>

                    <Loggers>
                        <logger
name="software.amazon.awssdk.transfer.s3.progress.LoggingTransferListener"
level="INFO" additivity="false">
                            <AppenderRef ref="AlignedConsoleAppender"/>
                        </logger>
                    </Loggers>
                </Configuration>

            Log4J2 logs the progress. The following is example output for a 21.3
MB file download.
                Transfer initiated...
                |=======             | 39.4%
                |===============     | 78.8%
                |====================| 100.0%
                Transfer complete!
        */
    }
```

## Recursively upload a local directory to an Amazon Simple Storage Service (Amazon S3) bucket

The following code example shows how to upload a local directory recursively to an Amazon Simple Storage Service (Amazon S3) bucket.

Java

**SDK for Java 2.x**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Use an S3TransferManager to upload a local directory. View the complete file and test.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.services.s3.model.ObjectIdentifier;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.CompletedDirectoryUpload;
import software.amazon.awssdk.transfer.s3.model.DirectoryUpload;
import software.amazon.awssdk.transfer.s3.model.UploadDirectoryRequest;

import java.net.URI;
import java.net.URISyntaxException;
import java.net.URL;
import java.nio.file.Paths;
import java.util.UUID;

    public Integer uploadDirectory(S3TransferManager transferManager,
            URI sourceDirectory, String bucketName) {
        DirectoryUpload directoryUpload =
 transferManager.uploadDirectory(UploadDirectoryRequest.builder()
                .source(Paths.get(sourceDirectory))
```

```
                .bucket(bucketName)
                .build());

        CompletedDirectoryUpload completedDirectoryUpload =
directoryUpload.completionFuture().join();
        completedDirectoryUpload.failedTransfers()
                .forEach(fail -> logger.warn("Object [{}] failed to transfer",
fail.toString()));
        return completedDirectoryUpload.failedTransfers().size();
    }
```

- For API details, see UploadDirectory in *AWS SDK for Java 2.x API Reference*.

## Upload or download large files to and from Amazon S3 using an AWS SDK

The following code examples show how to upload or download large files to and from Amazon S3.

For more information, see Uploading an object using multipart upload.

.NET

**AWS SDK for .NET**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Call functions that transfer files to and from an S3 bucket using the Amazon S3 TransferUtility.

```
global using System.Text;
global using Amazon.S3;
global using Amazon.S3.Model;
```

```
global using Amazon.S3.Transfer;
global using TransferUtilityBasics;

// This Amazon S3 client uses the default user credentials
// defined for this computer.
using Microsoft.Extensions.Configuration;

IAmazonS3 client = new AmazonS3Client();
var transferUtil = new TransferUtility(client);
IConfiguration _configuration;

_configuration = new ConfigurationBuilder()
    .SetBasePath(Directory.GetCurrentDirectory())
    .AddJsonFile("settings.json") // Load test settings from JSON file.
    .AddJsonFile("settings.local.json",
        true) // Optionally load local settings.
    .Build();

// Edit the values in settings.json to use an S3 bucket and files that
// exist on your AWS account and on the local computer where you
// run this scenario.
var bucketName = _configuration["BucketName"];
var localPath =
 $"{Environment.GetFolderPath(Environment.SpecialFolder.ApplicationData)}\
\TransferFolder";

DisplayInstructions();

PressEnter();

Console.WriteLine();

// Upload a single file to an S3 bucket.
DisplayTitle("Upload a single file");

var fileToUpload = _configuration["FileToUpload"];
Console.WriteLine($"Uploading {fileToUpload} to the S3 bucket, {bucketName}.");

Upload a large object by using an upload manager to break the data into parts and upload them concurrently.

```
// BucketBasics encapsulates the Amazon Simple Storage Service (Amazon S3)
 actions
// used in the examples.
// It contains S3Client, an Amazon S3 service client that is used to perform
 bucket
// and object actions.
type BucketBasics struct {
 S3Client *s3.Client
}

// UploadLargeObject uses an upload manager to upload data to an object in a
 bucket.
// The upload manager breaks large data into parts and uploads the parts
 concurrently.
func (basics BucketBasics) UploadLargeObject(bucketName string, objectKey string,
 largeObject []byte) error {
 largeBuffer := bytes.NewReader(largeObject)
 var partMiBs int64 = 10
 uploader := manager.NewUploader(basics.S3Client, func(u *manager.Uploader) {
  u.PartSize = partMiBs * 1024 * 1024
 })
 _, err := uploader.Upload(context.TODO(), &s3.PutObjectInput{
  Bucket: aws.String(bucketName),
  Key:    aws.String(objectKey),
  Body:   largeBuffer,
 })
 if err != nil {
  log.Printf("Couldn't upload large object to %v:%v. Here's why: %v\n",
   bucketName, objectKey, err)
 }

 return err
}
```

Download a large object by using a download manager to get the data in parts and download them concurrently.

```
// DownloadLargeObject uses a download manager to download an object from a
 bucket.
// The download manager gets the data in parts and writes them to a buffer until
 all of
// the data has been downloaded.
func (basics BucketBasics) DownloadLargeObject(bucketName string, objectKey
 string) ([]byte, error) {
 var partMiBs int64 = 10
 downloader := manager.NewDownloader(basics.S3Client, func(d *manager.Downloader)
 {
  d.PartSize = partMiBs * 1024 * 1024
 })
 buffer := manager.NewWriteAtBuffer([]byte{})
 _, err := downloader.Download(context.TODO(), buffer, &s3.GetObjectInput{
  Bucket: aws.String(bucketName),
  Key:    aws.String(objectKey),
 })
 if err != nil {
  log.Printf("Couldn't download large object from %v:%v. Here's why: %v\n",
   bucketName, objectKey, err)
 }
 return buffer.Bytes(), err
}
```

Call functions that transfer files to and from an S3 bucket using the S3TransferManager.

```
   public Integer downloadObjectsToDirectory(S3TransferManager transferManager,
           URI destinationPathURI, String bucketName) {
       DirectoryDownload directoryDownload =
transferManager.downloadDirectory(DownloadDirectoryRequest.builder()
               .destination(Paths.get(destinationPathURI))
               .bucket(bucketName)
               .build());
       CompletedDirectoryDownload completedDirectoryDownload =
directoryDownload.completionFuture().join();

       completedDirectoryDownload.failedTransfers()
               .forEach(fail -> logger.warn("Object [{}] failed to transfer",
fail.toString()));
       return completedDirectoryDownload.failedTransfers().size();
   }
```

Upload an entire local directory.

```
   public Integer uploadDirectory(S3TransferManager transferManager,
           URI sourceDirectory, String bucketName) {
       DirectoryUpload directoryUpload =
transferManager.uploadDirectory(UploadDirectoryRequest.builder()
               .source(Paths.get(sourceDirectory))
               .bucket(bucketName)
               .build());

       CompletedDirectoryUpload completedDirectoryUpload =
directoryUpload.completionFuture().join();
       completedDirectoryUpload.failedTransfers()
               .forEach(fail -> logger.warn("Object [{}] failed to transfer",
fail.toString()));
       return completedDirectoryUpload.failedTransfers().size();
   }
```

Upload a single file.

```
   public String uploadFile(S3TransferManager transferManager, String
bucketName,
                            String key, URI filePathURI) {
       UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
```

```
            .putObjectRequest(b -> b.bucket(bucketName).key(key))
            .source(Paths.get(filePathURI))
            .build();

        FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);

        CompletedFileUpload uploadResult = fileUpload.completionFuture().join();
        return uploadResult.response().eTag();
    }
```

>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create functions that transfer files using several of the available transfer manager settings. Use a callback class to write callback progress during file transfer.

```
import sys
import threading

import boto3
from boto3.s3.transfer import TransferConfig

MB = 1024 * 1024
s3 = boto3.resource("s3")

class TransferCallback:
    """
    Handle callbacks from the transfer manager.
```

```
    The transfer manager periodically calls the __call__ method throughout
    the upload and download process so that it can take action, such as
    displaying progress to the user and collecting data about the transfer.
    """

    def __init__(self, target_size):
        self._target_size = target_size
        self._total_transferred = 0
        self._lock = threading.Lock()
        self.thread_info = {}

    def __call__(self, bytes_transferred):
        """
        The callback method that is called by the transfer manager.

        Display progress during file transfer and collect per-thread transfer
        data. This method can be called by multiple threads, so shared instance
        data is protected by a thread lock.
        """

## Upload a stream of unknown size to an Amazon S3 object using an AWS SDK

The following code example shows how to upload a stream of unknown size to an Amazon S3 object.

Java

### SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Use the AWS CRT-based S3 Client.

```
import com.example.s3.util.AsyncExampleUtils;
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.async.AsyncRequestBody;
import software.amazon.awssdk.core.async.BlockingInputStreamAsyncRequestBody;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.services.s3.S3AsyncClient;
import software.amazon.awssdk.services.s3.model.PutObjectResponse;

import java.io.ByteArrayInputStream;
import java.util.UUID;
import java.util.concurrent.CompletableFuture;

    /**
     * @param s33CrtAsyncClient - To upload content from a stream of unknown
 size, use the AWS CRT-based S3 client. For more information, see
     *                          https://docs.aws.amazon.com/sdk-for-java/latest/
developer-guide/crt-based-s3-client.html.
     * @param bucketName - The name of the bucket.
     * @param key - The name of the object.
     * @return software.amazon.awssdk.services.s3.model.PutObjectResponse -
 Returns metadata pertaining to the put object operation.
     */
    public PutObjectResponse putObjectFromStream(S3AsyncClient s33CrtAsyncClient,
 String bucketName, String key) {

        BlockingInputStreamAsyncRequestBody body =
                AsyncRequestBody.forBlockingInputStream(null); // 'null'
 indicates a stream will be provided later.

        CompletableFuture<PutObjectResponse> responseFuture =
```

```
                s33CrtAsyncClient.putObject(r -> r.bucket(bucketName).key(key),
 body);

        // AsyncExampleUtils.randomString() returns a random string up to 100
 characters.
        String randomString = AsyncExampleUtils.randomString();
        logger.info("random string to upload: {}: length={}", randomString,
 randomString.length());

        // Provide the stream of data to be uploaded.
        body.writeInputStream(new ByteArrayInputStream(randomString.getBytes()));

        PutObjectResponse response = responseFuture.join(); // Wait for the
 response.
        logger.info("Object {} uploaded to bucket {}.", key, bucketName);
        return response;
    }
}
```

Use the Amazon S3 Transfer Manager.

```
import com.example.s3.util.AsyncExampleUtils;
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.async.AsyncRequestBody;
import software.amazon.awssdk.core.async.BlockingInputStreamAsyncRequestBody;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.CompletedUpload;
import software.amazon.awssdk.transfer.s3.model.Upload;

import java.io.ByteArrayInputStream;
import java.util.UUID;

    /**
     * @param transferManager - To upload content from a stream of unknown size,
 use the S3TransferManager based on the AWS CRT-based S3 client.
     *                        For more information, see https://
docs.aws.amazon.com/sdk-for-java/latest/developer-guide/transfer-manager.html.
     * @param bucketName - The name of the bucket.
     * @param key - The name of the object.
```

```
     * @return - software.amazon.awssdk.transfer.s3.model.CompletedUpload - The
 result of the completed upload.
     */
    public CompletedUpload uploadStream(S3TransferManager transferManager, String
 bucketName, String key) {

        BlockingInputStreamAsyncRequestBody body =
                AsyncRequestBody.forBlockingInputStream(null); // 'null'
 indicates a stream will be provided later.

        Upload upload = transferManager.upload(builder -> builder
                .requestBody(body)
                .putObjectRequest(req -> req.bucket(bucketName).key(key))
                .build());

        // AsyncExampleUtils.randomString() returns a random string up to 100
 characters.
        String randomString = AsyncExampleUtils.randomString();
        logger.info("random string to upload: {}: length={}", randomString,
 randomString.length());

        // Provide the stream of data to be uploaded.
        body.writeInputStream(new ByteArrayInputStream(randomString.getBytes()));

        return upload.completionFuture().join();
    }
}
```

## Use checksums to work with an Amazon S3 object using an AWS SDK

The following code example shows how to use checksums to work with an Amazon S3 object.

Java

### SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

The code examples use a subset of the following imports.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.core.sync.RequestBody;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.ChecksumAlgorithm;
import software.amazon.awssdk.services.s3.model.ChecksumMode;
import software.amazon.awssdk.services.s3.model.CompletedMultipartUpload;
import software.amazon.awssdk.services.s3.model.CompletedPart;
import software.amazon.awssdk.services.s3.model.CreateMultipartUploadResponse;
import software.amazon.awssdk.services.s3.model.GetObjectResponse;
import software.amazon.awssdk.services.s3.model.UploadPartRequest;
import software.amazon.awssdk.services.s3.model.UploadPartResponse;
import software.amazon.awssdk.services.s3.waiters.S3Waiter;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.FileUpload;
import software.amazon.awssdk.transfer.s3.model.UploadFileRequest;

import java.io.FileInputStream;
import java.io.IOException;
import java.io.RandomAccessFile;
import java.net.URISyntaxException;
import java.net.URL;
import java.nio.ByteBuffer;
import java.nio.file.Paths;
import java.security.DigestInputStream;
import java.security.MessageDigest;
import java.security.NoSuchAlgorithmException;
import java.util.ArrayList;
import java.util.Base64;
```

```
import java.util.List;
import java.util.Objects;
import java.util.UUID;
```

Specify a checksum algorithm for the `putObject` method when you build the `PutObjectRequest`.

```
    public void putObjectWithChecksum() {
        s3Client.putObject(b -> b
                .bucket(bucketName)
                .key(key)
                .checksumAlgorithm(ChecksumAlgorithm.CRC32),
                RequestBody.fromString("This is a test"));
    }
```

Verify the checksum for the `getObject` method when you build the GetObjectRequest.

```
    public GetObjectResponse getObjectWithChecksum() {
        return s3Client.getObject(b -> b
                .bucket(bucketName)
                .key(key)
                .checksumMode(ChecksumMode.ENABLED))
                .response();
    }
```

Pre-calculate a checksum for the `putObject` method when you build the `PutObjectRequest`.

```
    public void putObjectWithPrecalculatedChecksum(String filePath) {
        String checksum = calculateChecksum(filePath, "SHA-256");

        s3Client.putObject((b -> b
                .bucket(bucketName)
                .key(key)
                .checksumSHA256(checksum)),
                RequestBody.fromFile(Paths.get(filePath)));
    }
```

Use the S3 Transfer Manager on top of the AWS CRT-based S3 client to transparently perform a multipart upload when the size of the content exceeds a threshold. The default threshold size is 8 MB.

You can specify a checksum algorithm for the SDK to use. By default, the SDK uses the CRC32 algorithm.

```
    public void multipartUploadWithChecksumTm(String filePath) {
        S3TransferManager transferManager = S3TransferManager.create();
        UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
                .putObjectRequest(b -> b
                        .bucket(bucketName)
                        .key(key)
                        .checksumAlgorithm(ChecksumAlgorithm.SHA1))
                .source(Paths.get(filePath))
                .build();
        FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);
        fileUpload.completionFuture().join();
        transferManager.close();
    }
```

Use the S3Client API or (S3AsyncClient API) to perform a multipart upload. If you specify an additional checksum, you must specify the algorithm to use on the initiation of the upload. You must also specify the algorithm for each part request and provide the checksum calculated for each part after it is uploaded.

```
    public void multipartUploadWithChecksumS3Client(String filePath) {
        ChecksumAlgorithm algorithm = ChecksumAlgorithm.CRC32;

        // Initiate the multipart upload.
        CreateMultipartUploadResponse createMultipartUploadResponse =
s3Client.createMultipartUpload(b -> b
                .bucket(bucketName)
                .key(key)
                .checksumAlgorithm(algorithm)); // Checksum specified on
initiation.
        String uploadId = createMultipartUploadResponse.uploadId();

        // Upload the parts of the file.
        int partNumber = 1;
        List<CompletedPart> completedParts = new ArrayList<>();
```

```
        ByteBuffer bb = ByteBuffer.allocate(1024 * 1024 * 5); // 5 MB byte buffer

        try (RandomAccessFile file = new RandomAccessFile(filePath, "r")) {
            long fileSize = file.length();
            long position = 0;
            while (position < fileSize) {
                file.seek(position);
                long read = file.getChannel().read(bb);

                bb.flip(); // Swap position and limit before reading from the
buffer.
                UploadPartRequest uploadPartRequest = UploadPartRequest.builder()
                        .bucket(bucketName)
                        .key(key)
                        .uploadId(uploadId)
                        .checksumAlgorithm(algorithm) // Checksum specified on
each part.
                        .partNumber(partNumber)
                        .build();

                UploadPartResponse partResponse = s3Client.uploadPart(
                        uploadPartRequest,
                        RequestBody.fromByteBuffer(bb));

                CompletedPart part = CompletedPart.builder()
                        .partNumber(partNumber)
                        .checksumCRC32(partResponse.checksumCRC32()) // Provide
the calculated checksum.
                        .eTag(partResponse.eTag())
                        .build();
                completedParts.add(part);

                bb.clear();
                position += read;
                partNumber++;
            }
        } catch (IOException e) {
            System.err.println(e.getMessage());
        }

        // Complete the multipart upload.
        s3Client.completeMultipartUpload(b -> b
                .bucket(bucketName)
                .key(key)
```

```
                .uploadId(uploadId)

.multipartUpload(CompletedMultipartUpload.builder().parts(completedParts).build()));
   }
```

## Work with Amazon S3 object integrity features using an AWS SDK

The following code example shows how to work with S3 object integrity features.

C++

**SDK for C++**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Run an interactive scenario demonstrating Amazon S3 object integrity features.

```
//! Routine which runs the S3 object integrity workflow.
/*!
   \param clientConfig: Aws client configuration.
   \return bool: Function succeeded.
*/
bool AwsDoc::S3::s3ObjectIntegrityWorkflow(
        const Aws::S3::S3ClientConfiguration &clientConfiguration) {

    /*
```

```
     * Create a large file to be used for multipart uploads.
     */
    if (!createLargeFileIfNotExists()) {
        std::cerr << "Workflow exiting because large file creation failed." <<
std::endl;
        return false;
    }

    Aws::String bucketName = TEST_BUCKET_PREFIX;
    bucketName += Aws::Utils::UUID::RandomUUID();
    bucketName = Aws::Utils::StringUtils::ToLower(bucketName.c_str());

    bucketName.resize(std::min(bucketName.size(), MAX_BUCKET_NAME_LENGTH));

    introductoryExplanations(bucketName);

    if (!AwsDoc::S3::createBucket(bucketName, clientConfiguration)) {
        std::cerr << "Workflow exiting because bucket creation failed." <<
std::endl;
        return false;
    }

    Aws::S3::S3ClientConfiguration s3ClientConfiguration(clientConfiguration);
    std::shared_ptr<Aws::S3::S3Client> client =
Aws::MakeShared<Aws::S3::S3Client>("S3Client", s3ClientConfiguration);

    printAsterisksLine();
    std::cout << "Choose from one of the following checksum algorithms."
              << std::endl;

    for (HASH_METHOD hashMethod = DEFAULT; hashMethod <= SHA256; ++hashMethod) {

## Work with Amazon S3 versioned objects using an AWS SDK

The following code example shows how to:

- Create a versioned S3 bucket.
- Get all versions of an object.
- Roll an object back to a previous version.
- Delete and restore a versioned object.
- Permanently delete all versions of an object.

Python

### SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Create functions that wrap S3 actions.

```
def create_versioned_bucket(bucket_name, prefix):
    """
    Creates an Amazon S3 bucket, enables it for versioning, and configures a
 lifecycle
    that expires noncurrent object versions after 7 days.

    Adding a lifecycle configuration to a versioned bucket is a best practice.
    It helps prevent objects in the bucket from accumulating a large number of
    noncurrent versions, which can slow down request performance.

    Usage is shown in the usage_demo_single_object function at the end of this
 module.

    :param bucket_name: The name of the bucket to create.
    :param prefix: Identifies which objects are automatically expired under the
                   configured lifecycle rules.
    :return: The newly created bucket.
    """

# Serverless examples for Amazon S3 using AWS SDKs

The following code examples show how to use Amazon S3 with AWS SDKs.

**Examples**

- Invoke a Lambda function from an Amazon S3 trigger

## Invoke a Lambda function from an Amazon S3 trigger

The following code examples show how to implement a Lambda function that receives an event triggered by uploading an object to an S3 bucket. The function retrieves the S3 bucket name and object key from the event parameter and calls the Amazon S3 API to retrieve and log the content type of the object.

.NET

**AWS SDK for .NET**

> **Note**

# Cross-service examples for Amazon S3 using AWS SDKs

The following sample applications use AWS SDKs to combine Amazon S3 with other AWS services. Each example includes a link to GitHub, where you can find instructions on how to set up and run the application.

**Examples**

- Build an Amazon Transcribe app
- Convert text to speech and back to text using an AWS SDK
- Create a photo asset management application that lets users manage photos using labels
- Create an Amazon Textract explorer application
- Detect PPE in images with Amazon Rekognition using an AWS SDK
- Detect entities in text extracted from an image using an AWS SDK
- Detect faces in an image using an AWS SDK
- Detect objects in images with Amazon Rekognition using an AWS SDK
- Detect people and objects in a video with Amazon Rekognition using an AWS SDK
- Save EXIF and other image information using an AWS SDK
- Transform data for your application with S3 Object Lambda

## Build an Amazon Transcribe app

The following code example shows how to use Amazon Transcribe to transcribe and display voice recordings in the browser.

JavaScript

**SDK for JavaScript (v3)**

Create an app that uses Amazon Transcribe to transcribe and display voice recordings in the browser. The app uses two Amazon Simple Storage Service (Amazon S3) buckets, one to host the application code, and another to store transcriptions. The app uses an Amazon Cognito user pool to authenticate your users. Authenticated users have AWS Identity and Access Management (IAM) permissions to access the required AWS services.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

This example is also available in the AWS SDK for JavaScript v3 developer guide.

**Services used in this example**

- Amazon Cognito Identity
- Amazon S3
- Amazon Transcribe

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Convert text to speech and back to text using an AWS SDK

The following code example shows how to:

- Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file.
- Upload the audio file to an Amazon S3 bucket.
- Use Amazon Transcribe to convert the audio file to text.
- Display the text.

Rust

**SDK for Rust**

Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file, upload the audio file to an Amazon S3 bucket, use Amazon Transcribe to convert that audio file to text, and display the text.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon Polly
- Amazon S3
- Amazon Transcribe

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Create a photo asset management application that lets users manage photos using labels

The following code examples show how to create a serverless application that lets users manage photos using labels.

.NET

**AWS SDK for .NET**

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on AWS Community.

**Services used in this example**

- API Gateway

- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

C++

**SDK for C++**

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on AWS Community.

**Services used in this example**

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

Java

**SDK for Java 2.x**

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on AWS Community.

**Services used in this example**

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

JavaScript

**SDK for JavaScript (v3)**

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on AWS Community.

**Services used in this example**

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

Kotlin

**SDK for Kotlin**

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on AWS Community.

**Services used in this example**

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

PHP

**SDK for PHP**

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on AWS Community.

**Services used in this example**

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

Rust

**SDK for Rust**

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on AWS Community.

**Services used in this example**

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Create an Amazon Textract explorer application

The following code examples show how to explore Amazon Textract output through an interactive application.

JavaScript

**SDK for JavaScript (v3)**

Shows how to use the AWS SDK for JavaScript to build a React application that uses Amazon Textract to extract data from a document image and display it in an interactive web page. This example runs in a web browser and requires an authenticated Amazon Cognito identity for credentials. It uses Amazon Simple Storage Service (Amazon S3) for storage, and for notifications it polls an Amazon Simple Queue Service (Amazon SQS) queue that is subscribed to an Amazon Simple Notification Service (Amazon SNS) topic.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon Cognito Identity

- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon Textract

Python

**SDK for Python (Boto3)**

Shows how to use the AWS SDK for Python (Boto3) with Amazon Textract to detect text, form, and table elements in a document image. The input image and Amazon Textract output are shown in a Tkinter application that lets you explore the detected elements.

- Submit a document image to Amazon Textract and explore the output of detected elements.
- Submit images directly to Amazon Textract or through an Amazon Simple Storage Service (Amazon S3) bucket.
- Use asynchronous APIs to start a job that publishes a notification to an Amazon Simple Notification Service (Amazon SNS) topic when the job completes.
- Poll an Amazon Simple Queue Service (Amazon SQS) queue for a job completion message and display the results.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon Textract

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

# Detect PPE in images with Amazon Rekognition using an AWS SDK

The following code examples show how to build an app that uses Amazon Rekognition to detect Personal Protective Equipment (PPE) in images.

Java

**SDK for Java 2.x**

Shows how to create an AWS Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

**SDK for JavaScript (v3)**

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an application to detect personal protective equipment (PPE) in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app saves the results to an Amazon DynamoDB table, and sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for PPE using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Update a DynamoDB table with results.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Detect entities in text extracted from an image using an AWS SDK

The following code example shows how to use Amazon Comprehend to detect entities in text extracted by Amazon Textract from an image that is stored in Amazon S3.

Python

**SDK for Python (Boto3)**

Shows how to use the AWS SDK for Python (Boto3) in a Jupyter notebook to detect entities in text that is extracted from an image. This example uses Amazon Textract to extract text from an image stored in Amazon Simple Storage Service (Amazon S3) and Amazon Comprehend to detect entities in the extracted text.

This example is a Jupyter notebook and must be run in an environment that can host notebooks. For instructions on how to run the example using Amazon SageMaker, see the directions in TextractAndComprehendNotebook.ipynb.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon Comprehend
- Amazon S3
- Amazon Textract

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Detect faces in an image using an AWS SDK

The following code example shows how to:

- Save an image in an Amazon S3 bucket.
- Use Amazon Rekognition to detect facial details, such as age range, gender, and emotion (such as smiling).
- Display those details.

Rust

**SDK for Rust**

Save the image in an Amazon S3 bucket with an **uploads** prefix, use Amazon Rekognition to detect facial details, such as age range, gender, and emotion (smiling, etc.), and display those details.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon Rekognition
- Amazon S3

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Detect objects in images with Amazon Rekognition using an AWS SDK

The following code examples show how to build an app that uses Amazon Rekognition to detect objects by category in images.

.NET

**AWS SDK for .NET**

Shows how to use Amazon Rekognition .NET API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

Java

**SDK for Java 2.x**

Shows how to use Amazon Rekognition Java API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

**SDK for JavaScript (v3)**

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for objects using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

Kotlin

**SDK for Kotlin**

Shows how to use Amazon Rekognition Kotlin API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon Rekognition
- Amazon S3

- Amazon SES

Python

**SDK for Python (Boto3)**

Shows you how to use the AWS SDK for Python (Boto3) to create a web application that lets you do the following:

- Upload photos to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Rekognition to analyze and label the photos.
- Use Amazon Simple Email Service (Amazon SES) to send email reports of image analysis.

This example contains two main components: a webpage written in JavaScript that is built with React, and a REST service written in Python that is built with Flask-RESTful.

You can use the React webpage to:

- Display a list of images that are stored in your S3 bucket.
- Upload images from your computer to your S3 bucket.
- Display images and labels that identify items that are detected in the image.
- Get a report of all images in your S3 bucket and send an email of the report.

The webpage calls the REST service. The service sends requests to AWS to perform the following actions:

- Get and filter the list of images in your S3 bucket.
- Upload photos to your S3 bucket.
- Use Amazon Rekognition to analyze individual photos and get a list of labels that identify items that are detected in the photo.
- Analyze all photos in your S3 bucket and use Amazon SES to email a report.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Detect people and objects in a video with Amazon Rekognition using an AWS SDK

The following code examples show how to detect people and objects in a video with Amazon Rekognition.

Java

**SDK for Java 2.x**

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

**SDK for JavaScript (v3)**

Shows how to use Amazon Rekognition with the AWS SDK for JavaScript to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.

- Analyze images for PPE using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Amazon Rekognition
- Amazon S3
- Amazon SES

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Save EXIF and other image information using an AWS SDK

The following code example shows how to:

- Get EXIF information from a a JPG, JPEG, or PNG file.
- Upload the image file to an Amazon S3 bucket.
- Use Amazon Rekognition to identify the three top attributes (labels) in the file.
- Add the EXIF and label information to an Amazon DynamoDB table in the Region.

Rust

**SDK for Rust**

Get EXIF information from a JPG, JPEG, or PNG file, upload the image file to an Amazon S3 bucket, use Amazon Rekognition to identify the three top attributes (*labels* in Amazon Rekognition) in the file, and add the EXIF and label information to a Amazon DynamoDB table in the Region.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- DynamoDB
- Amazon Rekognition
- Amazon S3

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

## Transform data for your application with S3 Object Lambda

The following code example shows how to transform data for your application with S3 Object Lambda.

.NET

**AWS SDK for .NET**

Shows how to add custom code to standard S3 GET requests to modify the requested object retrieved from S3 so that the object suit the needs of the requesting client or application.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

**Services used in this example**

- Lambda
- Amazon S3

For a complete list of AWS SDK developer guides and code examples, see Using this service with an AWS SDK. This topic also includes information about getting started and details about previous SDK versions.

# Troubleshooting

This section describes how to troubleshoot Amazon S3 features and explains how to get request IDs that you'll need when you contact AWS Support.

**Topics**

## Troubleshoot Access Denied (403 Forbidden) errors in Amazon S3

**Important**

On May 13, 2024, we started deploying a change to eliminate charges for unauthorized requests that aren't initiated by the bucket owner. After the deployment of this change is completed, bucket owners will never incur request or bandwidth charges for requests that return `AccessDenied` (HTTP `403 Forbidden`) errors when these requests are initiated from outside of their individual AWS account or AWS organization. For more information on a full list of HTTP 3XX and 4XX status codes that won't be billed, see Billing for Amazon S3 error responses. This billing change requires no updates to your applications and applies to all S3 buckets. When deployment of this change is completed in all AWS Regions, we'll update our documentation.

The following topics cover the most common causes of Access Denied (403 Forbidden) errors in Amazon S3.

> **Note**
>
> For `Access Denied` (HTTP `403 Forbidden`), S3 doesn't charge the bucket owner when the request is initiated outside of the bucket owner's individual AWS account or the bucket owner's AWS organization.

**Topics**

> **Note**
>
> If you're trying to troubleshoot a permissions issue, start with the Bucket policies and IAM policies section, and be sure to follow the guidance in Tips for checking permissions.

# Bucket policies and IAM policies

## Bucket-level operations

If there is no bucket policy in place, then the bucket implicitly allows requests from any AWS Identity and Access Management (IAM) identity in the bucket-owning account. The bucket also implicitly denies requests from any other IAM identities from any other accounts, and anonymous (unsigned) requests. However, if there is no IAM user policy in place, the requester (unless they are the root user) is implicitly denied from making any requests. For more information about this evaluation logic, see Determining whether a request is denied or allowed within an account in the *IAM User Guide*.

## Object-level operations

If the object is owned by the bucket-owning account, the bucket policy and IAM user policy will function in the same way for object-level operations as they do for bucket-level operations. For example, if there is no bucket policy in place, then the bucket implicitly allows object requests from any IAM identity in the bucket-owning account. The bucket also implicitly denies object requests from any other IAM identities from any other accounts, and anonymous (unsigned) requests. However, if there is no IAM user policy in place, the requester (unless they are the root user) is implicitly denied from making any object requests.

If the object is owned by an external account, then access to the object can be granted only through object access control lists (ACLs). The bucket policy and IAM user policy can still be used to deny object requests.

Therefore, to ensure that your bucket policy or IAM user policy is not causing an Access Denied (403 Forbidden) error, make sure that the following requirements are met:

- For same-account access, there must not be an explicit `Deny` statement against the requester you are trying to grant permissions to, in either the bucket policy or the IAM user policy. If you want to grant permissions by using only the bucket policy and the IAM user policy, there must be at least one explicit `Allow` statement in one of these policies.
- For cross-account access, there must not be an explicit `Deny` statement against the requester you are trying to grant permissions to, in either the bucket policy or the IAM user policy. If you want to grant cross-account permissions by using only the bucket policy and IAM user policy, then both the bucket policy and the IAM user policy of the requester must include an explicit `Allow` statement.

> **Note**
>
> `Allow` statements in a bucket policy apply only to objects that are owned by the same bucket-owning account. However, `Deny` statements in a bucket policy apply to all objects regardless of object ownership.

**To review or edit your bucket policy**

> **Note**
>
> To view or edit a bucket policy, you must have the `s3:GetBucketPolicy` permission.

1. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Buckets**.
3. From the **Buckets** list, choose the name of the bucket that you want to view or edit a bucket policy for.
4. Choose the **Permissions** tab.
5. Under **Bucket policy**, choose **Edit**. The **Edit bucket policy** page appears.

To review or edit your bucket policy by using the AWS Command Line Interface (AWS CLI), use the get-bucket-policy command.

> **Note**
>
> If you get locked out of a bucket because of an incorrect bucket policy, sign in to the AWS Management Console by using your root user credentials. To regain access to your bucket, make sure to delete the bucket policy by using your root user credentials.

## Tips for checking permissions

To check whether the requester has proper permissions to perform an Amazon S3 operation, try the following:

- Identify the requester. If it's an unsigned request, then it's an anonymous request without an IAM user policy. If it's a request using a presigned URL, then the user policy will be the same as the one for the IAM user or role that signed the request.
- Verify that you're using the correct IAM user or role. You can verify your IAM user or role by checking the upper-right corner of the AWS Management Console or by using the aws sts get-caller-identity command.

- Check the IAM policies that are related to the IAM user or role. You can use one of the following methods:
  - Test IAM policies with the IAM policy simulator.
  - Review the different IAM policy types.
- If needed, edit your IAM user policy.
- Review the following examples of policies that explicitly deny or allow access:
  - Explicit allow IAM user policy: IAM: Allows and denies access to multiple services programmatically and in the console
  - Explicit allow bucket policy: Granting permissions to multiple accounts to upload objects or set object ACLs for public access
  - Explicit deny IAM user policy: AWS: Denies access to AWS based on the requested AWS Region
  - Explicit deny bucket policy: Require SSE-KMS for all objects written to a bucket

## Amazon S3 ACL settings

When checking your ACL settings, first review your Object Ownership setting to check whether ACLs are enabled on the bucket. Be aware that ACL permissions can be used only to grant permissions and cannot be used to reject requests. ACLs also cannot be used to grant access to requesters that are rejected by explicit denials in bucket policies or IAM user policies.

### The Object Ownership setting is set to bucket owner enforced

If the bucket owner enforced setting is enabled, then ACL settings are unlikely to cause an Access Denied (403 Forbidden) error because this setting disables all ACLs that apply to bucket and objects. Bucket owner enforced is the default (and recommended) setting for Amazon S3 buckets.

### The Object Ownership setting is set to bucket owner preferred or object writer

ACL permissions are still valid with the bucket owner preferred setting or the object writer setting. There are two kinds of ACLs: bucket ACLs and object ACLs. For the differences between these two types of ACLs, see Mapping of ACL permissions and access policy permissions.

Depending on the action of the rejected request, check the ACL permissions for your bucket or the object:

- If Amazon S3 rejected a `LIST`, PUT object, `GetBucketAcl`, or `PutBucketAcl` request, then review the ACL permissions for your bucket.

> **Note**
>
> You cannot grant GET object permissions with bucket ACL settings.

- If Amazon S3 rejected a GET request on an S3 object, or a PutObjectAcl request, then review the ACL permissions for the object.

> **Important**
>
> If the account that owns the object is different from the account that owns the bucket, then access to the object isn't controlled by the bucket policy.

### Troubleshooting an Access Denied (403 Forbidden) error from a GET object request during cross-account object ownership

Review the bucket's Object Ownership settings to determine the object owner. If you have access to the object ACLs, then you can also check the object owner's account. (To view the object owner's account, review the object ACL setting in the Amazon S3 console.) Alternatively, you can also make a `GetObjectAcl` request to find the object owner's canonical ID to verify the object owner account. By default, ACLs grant explicit allow permissions for GET requests to the object owner's account.

After you've confirmed that the object owner is different from the bucket owner, then depending on your use case and access level, choose one of the following methods to help address the Access Denied (403 Forbidden) error:

- **Disable ACLs (recommended)** – This method will apply to all objects and can be performed by the bucket owner. This method automatically gives the bucket owner ownership and full control over every object in the bucket. Before you implement this method, check the prerequisites for disabling ACLs. For information about how to set your bucket to bucket owner enforced (recommended) mode, see Setting Object Ownership on an existing bucket.

> **Important**
>
> To prevent an Access Denied (403 Forbidden) error, be sure to migrate the ACL permissions to a bucket policy before you disable ACLs. For more information, see Bucket policy examples for migrating from ACL permissions.

- **Change the object owner to the bucket owner** – This method can be applied to individual objects, but only the object owner (or a user with the appropriate permissions) can change an object's ownership. Additional PUT costs might apply. (For more information, see Amazon S3 pricing.) This method grants the bucket owner full ownership of the object, allowing the bucket owner to control access to the object through a bucket policy.

  To change the object's ownership, do one of the following:

  - You (the bucket owner) can copy the object back to the bucket.
  - You can change the Object Ownership setting of the bucket to bucket owner preferred. If versioning is disabled, the objects in the bucket are overwritten. If versioning is enabled, duplicate versions of the same object will appear in the bucket, which the bucket owner can set a lifecycle rule to expire. For instructions on how to change your Object Ownership setting, see Setting Object Ownership on an existing bucket.

    > **Note**
    >
    > When you update your Object Ownership setting to bucket owner preferred, the setting is only applied to new objects that are uploaded to the bucket.

  - You can have the object owner upload the object again with the `bucket-owner-full-control` canned object ACL.

  > **Note**
  >
  > For cross-account uploads, you can also require the `bucket-owner-full-control` canned object ACL in your bucket policy. For an example bucket policy, see Grant cross-account permissions to upload objects while ensuring that the bucket owner has full control.

- **Keep the object writer as the object owner** – This method doesn't change the object owner, but it does allow you to grant access to objects individually. To grant access to an object, you

must have the `PutObjectAcl` permission for the object. Then, to fix the Access Denied (403 Forbidden) error, add the requester as a grantee to access the object in the object's ACLs. For more information, see Configuring ACLs.

## S3 Block Public Access settings

If the failed request involves public access or public policies, then check the S3 Block Public Access settings on your account, bucket, or S3 access point. Starting in April 2023, all Block Public Access settings are enabled by default for new buckets. For more information about how Amazon S3 defines "public," see The meaning of "public".

When set to `TRUE`, Block Public Access settings act as explicit deny policies that override permissions allowed by ACLs, bucket policies, and IAM user policies. To determine whether your Block Public Access settings are rejecting your request, review the following scenarios:

- If the specified access control list (ACL) is public, then the `BlockPublicAcls` setting rejects your `PutBucketAcl` and `PutObjectACL` calls.
- If the request includes a public ACL, then the `BlockPublicAcls` setting rejects your `PutObject` calls.
- If the `BlockPublicAcls` setting is applied to an account and the request includes a public ACL, then any `CreateBucket` calls that include public ACLs will fail.
- If your request's permission is granted only by a public ACL, then the `IgnorePublicAcls` setting rejects the request.
- If the specified bucket policy allows public access, then the `BlockPublicPolicy` setting rejects your `PutBucketPolicy` calls.
- If the `BlockPublicPolicy` setting is applied to an access point, then all `PutAccessPointPolicy` and `PutBucketPolicy` calls that specify a public policy and are made through the access point will fail.
- If the access point or bucket has a public policy, then the `RestrictPublicBuckets` setting rejects all cross-account calls except for AWS service principals. This setting also rejects all anonymous (or unsigned) calls.

To review and update your Block Public Access setting configurations, see Configuring block public access settings for your S3 buckets.

# Amazon S3 encryption settings

Amazon S3 supports server-side encryption on your bucket. Server-side encryption is the encryption of data at its destination by the application or service that receives it. Amazon S3 encrypts your data at the object level as it writes it to disks in AWS data centers and decrypts it for you when you access it.

By default, Amazon S3 now applies server-side encryption with Amazon S3 managed keys (SSE-S3) as the base level of encryption for every bucket in Amazon S3. Amazon S3 also allows you to specify the server-side encryption method when uploading objects.

**To review your bucket's server-side encryption status and encryption settings**

1. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Buckets**.
3. From the **Buckets** list, choose the bucket that you want to check the encryption settings for.
4. Choose the **Properties** tab.
5. Scroll down to the **Default encryption** section and view the **Encryption type** settings.

To check your encryption settings by using the AWS CLI, use the get-bucket-encryption command.

**To check the encryption status of an object**

1. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Buckets**.
3. From the **Buckets** list, choose the name of the bucket that contains the object.
4. From the **Objects** list, choose the name of the object that you want to add or change encryption for.

   The object's details page appears.
5. Scroll down to the **Server-side encryption settings** section to view the object's server-side encryption settings.

To check your object encryption status by using the AWS CLI, use the head-object command.

### Encryption and permissions requirements

Amazon S3 supports three types of server-side encryption:

- Server-side encryption with Amazon S3 managed keys (SSE-S3)
- Server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS)
- Server-side encryption with customer-provided keys (SSE-C)

Based on your encryption settings, make sure that the following permissions requirements are met:

- **SSE-S3** – No extra permissions are required.
- **SSE-KMS (with a customer managed key)** – To upload objects, the `kms:GenerateDataKey` permission on the AWS KMS key is required. To download objects and perform multipart uploads of objects, the `kms:Decrypt` permission on the KMS key is required.
- **SSE-KMS (with an AWS managed key)** – The requester must be from the same account that owns the `aws/s3` KMS key. The requester must also have the correct Amazon S3 permissions to access the object.
- **SSE-C (with a customer provided key)** – No additional permissions are required. You can configure the bucket policy to require and restrict server-side encryption with customer-provided encryption keys for objects in your bucket.

If the object is encrypted with a customer managed key, make sure that the KMS key policy allows you to perform the `kms:GenerateDataKey` or `kms:Decrypt` actions. For instructions on checking your KMS key policy, see Viewing a key policy in the *AWS Key Management Service Developer Guide*.

## S3 Object Lock settings

If your bucket has S3 Object Lock enabled and the object is protected by a retention period or legal hold, Amazon S3 returns an Access Denied (403 Forbidden) error when you try to delete the object.

**To check whether the bucket has Object Lock enabled**

1. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Buckets**.

3. From the **Buckets** list, choose the name of the bucket that you want to review.
4. Choose the **Properties** tab.
5. Scroll down to the **Object Lock** section. Verify whether the **Object Lock** setting is **Enabled** or **Disabled**.

To determine whether the object is protected by a retention period or legal hold, view the lock information for your object.

If the object is protected by a retention period or legal hold, check the following:

- If the object version is protected by the compliance retention mode, there is no way to permanently delete it. A permanent `DELETE` request from any requester, including the root user, will result in an Access Denied (403 Forbidden) error. Also, be aware that when you submit a `DELETE` request for an object that's protected by the compliance retention mode, Amazon S3 creates a delete marker for the object.
- If the object version is protected with governance retention mode and you have the `s3:BypassGovernanceRetention` permission, you can bypass the protection and permanently delete the version. For more information, see Bypassing governance mode.
- If the object version is protected by a legal hold, then a permanent `DELETE` request can result in an Access Denied (403 Forbidden) error. To permanently delete the object version, you must remove the legal hold on the object version. To remove a legal hold, you must have the `s3:PutObjectLegalHold` permission. For more information about removing a legal hold, see Configuring S3 Object Lock.

## VPC endpoint policy

If you're accessing Amazon S3 by using a virtual private cloud (VPC) endpoint, make sure that the VPC endpoint policy is not blocking you from accessing your Amazon S3 resources. By default, the VPC endpoint policy allows all requests to Amazon S3. You can also configure the VPC endpoint policy to restrict certain requests. For information about how to check your VPC endpoint policy, see Control access to VPC endpoints by using endpoint policies in the *AWS PrivateLink Guide*.

## AWS Organizations policies

If your AWS account belongs to an organization, AWS Organizations policies can block you from accessing Amazon S3 resources. By default, AWS Organizations policies do not block any requests

to Amazon S3. However, make sure that your AWS Organizations policies haven't been configured to block access to S3 buckets. For instructions on how to check your AWS Organizations policies, see Listing all policies in the *AWS Organizations User Guide*.

## Access point settings

If you receive an Access Denied (403 Forbidden) error while making requests through Amazon S3 access points, you might need to check the following:

- The configurations for your access points
- The IAM user policy that's used for your access points
- The bucket policy that's used to manage or configure your cross-account access points

#### Access point configurations and policies

- When you create an access point, you can choose to designate **Internet** or **VPC** as the network origin. If the network origin is set to VPC only, Amazon S3 will reject any requests made to the access point that don't originate from the specified VPC. To check the network origin of your access point, see Creating access points restricted to a virtual private cloud.
- With access points, you can also configure custom Block Public Access settings, which work similarly to the Block Public Access settings at the bucket or account level. To check your custom Block Public Access settings, see Managing public access to access points.
- To make successful requests to Amazon S3 by using access points, make sure that the requester has the necessary IAM permissions. For more information, see Configuring IAM policies for using access points.
- If the request involves cross-account access points, make sure that the bucket owner has updated the bucket policy to authorize requests from the access point. For more information, see Granting permissions for cross-account access points.

If the Access Denied (403 Forbidden) error still persists after checking all the items in this topic, retrieve your Amazon S3 request ID and contact AWS Support for additional guidance.

# Troubleshoot Batch Operations

The following topics list common errors to help you troubleshoot issues that you might encounter during Batch Operations.

**Common Errors**

- Job report isn't delivered when there is a permissions issue or an S3 Object Lock retention mode is enabled
- S3 Batch Replication failure with error: Manifest generation found no keys matching the filter criteria
- Batch Operations failures occur after adding a new replication rule to an existing replication configuration
- Batch Operations failing objects with the error 400 InvalidRequest: Task failed due to missing VersionId
- Create job failure with job tag option enabled
- Access Denied to read the manifest

## Job report isn't delivered when there is a permissions issue or an S3 Object Lock retention mode is enabled

The following error occurs if required permissions are missing or Object Lock retention mode (either governance mode or compliance mode) is enabled on the destination bucket.

Error: Reasons for failure. The job report could not be written to your report bucket. Please check your permissions.

The IAM role and trust policy must be configured to allow S3 Batch Operations access to PUT objects in the bucket where the report will be delivered. If these required permissions are missing a job report delivery failure occurs.

When a retention mode is enabled, the bucket is write-once-read-many (WORM) protected. Object Lock with retention mode enabled on the destination bucket is not supported so job completion report delivery attempts fail. To fix this problem, choose a destination bucket for your job completion reports that doesn't have an Object Lock retention mode enabled.

## S3 Batch Replication failure with error: Manifest generation found no keys matching the filter criteria

Error: Manifest generation found no keys matching the filter criteria.

This error occurs for one of the following reasions:

- When objects in the source bucket are stored in the S3 Glacier Flexible Retrieval or S3 Glacier Deep Archive storage classes.

  To use Batch Replication on these objects, first restore them to the S3 Standard storage class by using an S3 Initiate Restore Object operation in a Batch Operations job. For more information, see Restoring an archived object and Restore objects (Batch Operations). After you've restored the objects, you can replicate them by using a Batch Replication job.

- When the provided filter criteria doesn't match any valid objects in the source bucket.

  Verify and correct the filter criteria. For example, in the Batch Replication rule, the filter criteria is looking for all objects in the *amzn-s3-demo-bucket* with the prefix `Tax/`. If the prefix name was entered inaccurately, with a slash in the beginning and the end `/Tax/` instead of only at the end, then no S3 objects were found. To resolve the error, correct the prefix, in this case, from `/Tax/` to `Tax/` in the replication rule.

## Batch Operations failures occur after adding a new replication rule to an existing replication configuration

Batch Operations attempts to perform existing object replication for every rule in the source bucket's replication configuration. If there are problems with any of the existing replication rules, failures might occur.

The Batch Operations job's completion report explains the job failure reasons. For a list of common errors, see Amazon S3 replication failure reasons.

## Batch Operations failing objects with the error 400 InvalidRequest: Task failed due to missing VersionId

The following example error occurs if a Batch Operations job is performing actions on objects in a versioned bucket and encounters an object in the manifest with an empty version ID field.

Error: *BUCKET_NAME,prefix/file_name*,failed,400,InvalidRequest,Task failed due to missing VersionId

This error occurs because the version ID field in the manifest is an empty string, instead of the literal `null` string.

Batch Operations will fail for that particular object or objects, but not the entire job. This problem occurs if the manifest format is configured to use version IDs during the operation. Non-versioned jobs don't encounter this issue because they operate only on the most recent version of each object and ignore the version IDs in the manifest.

To fix this problem, convert the empty version IDs to `null` strings. For more information, see the section called “Converting empty version ID strings to null strings”.

## Create job failure with job tag option enabled

Without the `s3:PutJobTagging` permission, creating Batch Operations jobs with the job tag option enabled causes `403 access denied` errors.

To create Batch Operations jobs with the job tag option enabled, the AWS Identity and Access Management (IAM) user that's creating the Batch Operations job must have the `s3:PutJobTagging` permission in addition to the `s3:CreateJob` permission.

For more information about the permissions required for Batch Operations, see the section called “Granting permissions”.

## Access Denied to read the manifest

If Batch Operations can't read the manifest file when you attempt to create a Batch Operations job, the following errors can occur.

**AWS CLI**

Reason for failure Reading the manifest is forbidden: AccessDenied

**Amazon S3 console**

Warning: Unable to get the manifest object's ETag. Specify a different object to continue.

To solve this problem, do the following:

- Verify that the IAM role for the AWS account that you used to create the Batch Operations job has `s3:GetObject` permissions. The account's IAM role must have `s3:GetObject` permissions to allow Batch Operations to read the manifest file.

  For more information about the permissions required for Batch Operations, see the section called “Granting permissions”.

- Check the manifest objects' metadata for any access mismatches with S3 Object Ownership. For more information about S3 Object Ownership, see the section called "Controlling object ownership".
- Check whether AWS Key Management Service (AWS KMS) keys are used to encrypt the manifest file.

  Batch Operations support *CSV inventory reports* that are AWS KMS-encrypted. However, Batch Operations don't support *CSV manifest files* that are AWS KMS-encrypted. For more information, see Configuring Amazon S3 Inventory and Specifying a manifest.

# Troubleshoot Amazon S3 Lifecycle issues

The following information can help you troubleshoot common issues with Amazon S3 Lifecycle rules.

**Topics**

## I ran a list operation on my bucket and saw objects that I thought were expired or transitioned by a lifecycle rule.

S3 Lifecycle object transitions and object expirations are asynchronous operations. Therefore, there might be a delay between the time that the objects are eligible for expiration or transition and

the time that they are actually transitioned or expired. Changes in billing are applied as soon as the lifecycle rule is satisfied, even if the action isn't complete. The exception to this behavior is if you have a lifecycle rule set to transition to the S3 Intelligent-Tiering storage class. In that case, billing changes don't occur until the object has transitioned to S3 Intelligent-Tiering. For more information about changes in billing, see Setting lifecycle configuration on a bucket.

> **Note**
>
> Amazon S3 doesn't transition objects that are smaller than 128 KB from the S3 Standard or S3 Standard-IA storage class to the S3 Intelligent-Tiering, S3 Standard-IA, or S3 One Zone-IA storage class.

## How do I monitor the actions taken by my lifecycle rules?

To monitor actions taken by lifecycle rules, you can use the following features:

- **S3 Event Notifications** – You can set up S3 Event Notifications so that you're notified of any S3 Lifecycle expiration or transition events.
- **S3 server access logs** – You can enable server access logs for your S3 buckets to capture S3 Lifecycle actions, such as object transitions to another storage class or object expirations. For more information, see Lifecycle and logging.

To view the changes in your storage caused by lifecycle actions on a daily basis, we recommend using S3 Storage Lens dashboards instead of using Amazon CloudWatch metrics. In your Storage Lens dashboard, you can view the following metrics, which monitor the object count or size:

- **Current version bytes**
- **Current version object count**
- **Noncurrent version bytes**
- **Noncurrent version object count**
- **Delete marker object count**
- **Delete marker storage bytes**
- **Incomplete multipart upload bytes**
- **Incomplete multipart upload object count**

# My S3 object count still increases, even after setting up lifecycle rules on a versioning-enabled bucket.

In a versioning-enabled bucket, when an object is expired, the object isn't completely deleted from the bucket. Instead, a delete marker is created as the newest version of the object. Delete markers are still counted as objects. Therefore, if a lifecycle rule is created to expire only the current versions, then the object count in the S3 bucket actually increases instead of going down.

For example, let's say an S3 bucket is versioning-enabled with 100 objects, and a lifecycle rule is set to expire current versions of the object after 7 days. After the seventh day, the object count increases to 200 because 100 delete markers are created in addition to the 100 original objects, which are now the noncurrent versions. For more information about S3 Lifecycle configuration rule actions for versioning-enabled buckets, see Setting lifecycle configuration on a bucket.

To permanently remove objects, add an additional lifecycle configuration to delete the previous versions of the objects, expired delete markers, and incomplete multipart uploads. For instructions on how to create new lifecycle rules, see Setting lifecycle configuration on a bucket.

**Note**

- Amazon S3 rounds the transition or expiration date of an object to midnight UTC the next day.

  When evaluating objects for lifecycle actions, Amazon S3 uses the object creation time in UTC. For example, consider a nonversioned bucket with a lifecycle rule that's configured to expire objects after one day. Suppose that an object was created on January 1 at 17:05 Pacific Daylight Time (PDT), which corresponds to January 2 at 00:05 UTC. The object becomes one day old at 00:05 UTC on January 3, which makes it eligible for expiration when S3 Lifecycle evaluates objects at 00:00 UTC on January 4.

  Because Amazon S3 lifecycle actions occur asynchronously, there might be some delay between the date specified in the lifecycle rule and the actual physical transition of the object. For more information, see Transition or expiration delay.

  For more information, see Lifecycle rules: Based on an object's age.

- For S3 objects that are protected by Object Lock, current versions are not permanently deleted. Instead, a delete marker is added to the objects, making them noncurrent. Noncurrent versions are then preserved and are not permanently expired.

## How do I empty my S3 bucket by using lifecycle rules?

S3 Lifecycle rules are an effective tool to empty an S3 bucket with millions of objects. To delete a large number of objects from your S3 bucket, make sure to use these two pairs of lifecycle rules:

- **Expire current versions of objects** and **Permanently delete previous versions of objects**
- **Delete expired delete markers** and **Delete incomplete multipart uploads**

For steps on how to create a lifecycle configuration rule, see Setting lifecycle configuration on a bucket.

**Note**

For S3 objects that are protected by Object Lock, current versions are not permanently deleted. Instead, a delete marker is added to the objects, making them noncurrent. Noncurrent versions are then preserved and are not permanently expired.

## My Amazon S3 bill increased after transitioning objects to a lower-cost storage class.

There are several reasons that your bill might increase after transitioning objects to a lower-cost storage class:

- S3 Glacier overhead charges for small objects

  For each object that is transitioned to S3 Glacier Flexible Retrieval or S3 Glacier Deep Archive, a total overhead of 40 KB is associated with this storage update. As part of the 40 KB overhead, 8 KB is used to store metadata and the name of the object. This 8 KB is charged according to S3 Standard rates. The remaining 32 KB is used for indexing and related metadata. This 32 KB is charged according to S3 Glacier Flexible Retrieval or S3 Glacier Deep Archive pricing.

Therefore, if you're storing many smaller sized objects, we don't recommend using lifecycle transitions. Instead, to reduce any overhead charges, consider aggregating many smaller objects into a smaller number of large objects before storing them in Amazon S3. For more information about cost considerations, see Transitioning to the S3 Glacier Flexible Retrieval and S3 Glacier Deep Archive storage classes (object archival).

- Minimum storage charges

  Some S3 storage classes have minimum storage-duration requirements. Objects that are deleted, overwritten, or transitioned from those classes before the minimum duration is satisfied are charged a prorated early transition or deletion fee. These minimum storage-duration requirements are as follows:

  - S3 Standard-IA and S3 One Zone-IA – 30 days
  - S3 Glacier Flexible Retrieval and S3 Glacier Instant Retrieval – 90 days
  - S3 Glacier Deep Archive – 180 days

  For more information about these requirements, see the *Constraints* section of Transitioning objects using S3 Lifecycle. For general S3 pricing information, see Amazon S3 pricing and the AWS Pricing Calculator.

- Lifecycle transition costs

  Each time an object is transitioned to a different storage class by a lifecycle rule, Amazon S3 counts that transition as one transition request. The costs for these transition requests are in addition to the costs of these storage classes. If you plan to transition a large number of objects, consider the request costs when transitioning to a lower tier. For more information, see Amazon S3 pricing.

## I've updated my bucket policy, but my S3 objects are still being deleted by expired lifecycle rules.

`Deny` statements in a bucket policy don't prevent the expiration of the objects defined in a lifecycle rule. Lifecycle actions (such as transitions or expirations) don't use the S3 `DeleteObject` operation. Instead, S3 Lifecycle actions are performed by using internal S3 endpoints. (For more information, see Lifecycle and logging.)

To prevent your lifecycle rule from taking any action, you must edit, delete, or disable the rule.

## Can I recover S3 objects that are expired by S3 Lifecycle rules?

The only way to recover objects that are expired by S3 Lifecycle is through versioning, which must be in place before the objects become eligible for expiration. You cannot undo the expiration operations that are performed by lifecycle rules. If objects are permanently deleted by the S3 Lifecycle rules that are in place, you cannot recover these objects. To enable versioning on a bucket, see the section called "Using S3 Versioning".

If you have applied versioning to the bucket and the noncurrent versions of the objects are still intact, you can restore previous versions of the expired objects. For more information about the behavior of S3 Lifecycle rule actions and versioning states, see the *Lifecycle actions and bucket versioning state* table in Elements to describe lifecycle actions.

> **Note**
>
> If the S3 bucket is protected by AWS Backup or S3 Replication, you might also be able to use these features to recover your expired objects.

## How can I exclude a prefix from my lifecycle rule?

S3 Lifecycle doesn't support excluding prefixes in your rules. Instead, use tags to tag all of the objects that you want to include in the rule. For more information about using tags in your lifecycle rules, see the section called "Example 1: Specifying a filter".

## How can I include multiple prefixes in my lifecycle rule?

S3 Lifecycle doesn't support including multiple prefixes in your rules. Instead, use tags to tag all of the objects that you want to include in the rule. For more information about using tags in your lifecycle rules, see the section called "Example 1: Specifying a filter".

However, if you have one or more prefixes that start with the same characters, you can include all of those prefixes in your rule by specifying a partial prefix with no trailing slash (/) in the filter. For example, suppose that you have these prefixes:

```
sales1999/
sales2000/
sales2001/
```

To include all three prefixes in your rule, specify `<Prefix>sales</Prefix>` in your lifecycle rule.

# Troubleshooting replication

This section lists troubleshooting tips for Amazon S3 Replication and information about S3 Batch Replication errors.

**Topics**

## Troubleshooting tips for S3 Replication

If object replicas don't appear in the destination bucket after you configure replication, use these troubleshooting tips to identify and fix issues.

- The majority of objects replicate within 15 minutes. The time that it takes Amazon S3 to replicate an object depends on several factors, including the source and destination Region pair, and the size of the object. For large objects, replication can take up to several hours. For visibility into replication times, you can use S3 Replication Time Control (S3 RTC).

  If the object that is being replicated is large, wait a while before checking to see whether it appears in the destination. You can also check the replication status of the source object. If the object replication status is `PENDING`, Amazon S3 has not completed the replication. If the object replication status is `FAILED`, check the replication configuration that's set on the source bucket. Additionally, to receive information about failures during replication, you can set up Amazon S3 Event Notifications replication to receive failure events. For more information, see Receiving replication failure events with Amazon S3 Event Notifications.
- You can call the `HeadObject` API operation to check the replication status of an object. The `HeadObject` API operation returns the `PENDING`,`COMPLETED`, or `FAILED` replication status of an object. In a response to a `HeadObject` API call, the replication status is returned in the `x-amz-replication-status` element.

  **Note**

  To run `HeadObject`, you must have read access to the object that you're requesting. A `HEAD` request has the same options as a `GET` request, without performing a `GET`

operation. For example, to run a `HeadObject` request by using the AWS Command Line Interface (AWS CLI), you can run the following command. Replace the *`user input placeholders`* with your own information.

```
aws s3api head-object --bucket my-bucket --key index.html
```

- After `HeadObject` returns the objects with a `FAILED` replication status, you can use S3 Batch Replication to replicate those failed objects. Alternatively, you can re-upload the failed objects to the source bucket, which will initiate replication for the new objects.
- In the replication configuration on the source bucket, verify the following:
  - The Amazon Resource Name (ARN) of the destination bucket is correct.
  - The key name prefix is correct. For example, if you set the configuration to replicate objects with the prefix `Tax`, then only objects with key names such as `Tax/document1` or `Tax/document2` are replicated. An object with the key name `document3` is not replicated.
  - The status of the replication rule is `Enabled`.
- Verify that versioning has not been suspended on any bucket in the replication configuration. Both the source and destination buckets must have versioning enabled.
- If a replication rule is set to **Change object ownership to the destination bucket owner**, then the AWS Identity and Access Management (IAM) role that's used for replication must have the `s3:ObjectOwnerOverrideToBucketOwner` permission. This permission is granted on the resource (in this case, the destination bucket). For example, the following `Resource` statement shows how to grant this permission on the destination bucket:

```
{
  "Effect":"Allow",
  "Action":[
    "s3:ObjectOwnerOverrideToBucketOwner"
  ],
  "Resource":"arn:aws:s3:::DestinationBucket/*"
}
```

- If the destination bucket is owned by another account, the owner of the destination bucket must also grant the `s3:ObjectOwnerOverrideToBucketOwner` permission to the source bucket owner through the destination bucket policy. To use the following example bucket policy, replace the *`user input placeholders`* with your own information:

```
{
```

```
  "Version": "2012-10-17",
  "Id": "Policy1644945280205",
  "Statement": [
    {
      "Sid": "Stmt1644945277847",
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::123456789101:role/s3-replication-role"
      },
      "Action": [
        "s3:ReplicateObject",
        "s3:ReplicateTags",
        "s3:ObjectOwnerOverrideToBucketOwner"
      ],
      "Resource": "arn:aws:s3:::DestinationBucket/*"
    }
  ]
}
```

> **Note**
>
> If the destination bucket's object ownership settings include **Bucket owner enforced**, then you don't need to update the setting to **Change object ownership to the destination bucket owner** in the replication rule. The object ownership change will occur by default. For more information about changing replica ownership, see Changing the replica owner.

- If you're setting the replication configuration in a cross-account scenario, where the source and destination buckets are owned by different AWS accounts,the destination buckets can't be configured as Requester Pays buckets. For more information, see Using Requester Pays buckets for storage transfers and usage.
- If a bucket's source objects are encrypted with an AWS Key Management Service (AWS KMS) key, then the replication rule must be configured to include AWS KMS-encrypted objects. Make sure to select **Replicate objects encrypted with AWS KMS** under your **Encryption** settings in the Amazon S3 console. Then, select an AWS KMS key for encrypting destination objects.

> **Note**
>
> If the destination bucket is in a different account, specify an AWS KMS customer managed key that is owned by the destination account. Don't use the default Amazon

S3 managed key (`aws/s3`). Using the default key encrypts the objects with the Amazon S3 managed key that is owned by the source account, preventing the object from being shared with another account. As a result, the destination account won't be able to access the objects in the destination bucket.

To use an AWS KMS key that belongs to the destination account to encrypt the destination objects, the destination account must grant the `kms:GenerateDataKey` and `kms:Encrypt` permissions to the replication role in the KMS key policy. To use the following example statement in your KMS key policy, replace the *`user input placeholders`* with your own information:

```
{
    "Sid": "AllowS3ReplicationSourceRoleToUseTheKey",
    "Effect": "Allow",
    "Principal": {
        "AWS": "arn:aws:iam::123456789101:role/s3-replication-role"
    },
    "Action": ["kms:GenerateDataKey", "kms:Encrypt"],
    "Resource": "*"
}
```

If you use an asterisk (*) for the `Resource` statement in the AWS KMS key policy, the policy grants permission to use the KMS key to only the replication role. The policy doesn't allow the replication role to elevate its permissions.

By default, the KMS key policy grants the root user full permissions to the key. These permissions can be delegated to other users in the same account. Unless there are `Deny` statements in the source KMS key policy, using an IAM policy to grant the replication role permissions to the source KMS key is sufficient.

**Note**

KMS key policies that restrict access to specific CIDR ranges, VPC endpoints, or S3 access points can cause replication to fail.

If either the source or destination KMS keys grant permissions based on the encryption context, confirm that Amazon S3 Bucket Keys are turned on for the buckets. If the buckets have S3 Bucket Keys turned on, the encryption context must be the bucket-level resource, like this:

```
"kms:EncryptionContext:arn:aws:arn": [
     "arn:aws:s3:::SOURCE_BUCKET_NAME"
     ]
"kms:EncryptionContext:arn:aws:arn": [
     "arn:aws:s3:::DESTINATION_BUCKET_NAME"
     ]
```

In addition to the permissions granted by the KMS key policy, the source account must add the following minimum permissions to the replication role's IAM policy:

```
{
    "Effect": "Allow",
    "Action": [
        "kms:Decrypt",
        "kms:GenerateDataKey"
    ],
    "Resource": [
        "SourceKmsKeyArn"
    ]
},
{
    "Effect": "Allow",
    "Action": [
        "kms:GenerateDataKey",
        "kms:Encrypt"
    ],
    "Resource": [
        "DestinationKmsKeyArn"
    ]
}
```

For more information about how to replicate objects that are encrypted with AWS KMS, see Replicating encrypted objects.

- If the destination bucket is owned by another AWS account, verify that the bucket owner has a bucket policy on the destination bucket that allows the source bucket owner to replicate objects.

For an example, see Configuring replication when source and destination buckets are owned by different accounts.

- If your objects still aren't replicating after you've validated the permissions, check for any explicit Deny statements in the following locations:
  - Deny statements in the source or destination bucket policies. Replication fails if the bucket policy denies access to the replication role for any of the following actions:

    Source bucket:

    ```
    "s3:GetReplicationConfiguration",
    "s3:ListBucket",
    "s3:GetObjectVersionForReplication",
    "s3:GetObjectVersionAcl",
    "s3:GetObjectVersionTagging"
    ```

    Destination buckets:

    ```
    "s3:ReplicateObject",
    "s3:ReplicateDelete",
    "s3:ReplicateTags"
    ```

  - Deny statements or permissions boundaries attached to the IAM role can cause replication to fail.
  - Deny statements in AWS Organizations service control policies attached to either the source or destination accounts can cause replication to fail.
- If an object replica doesn't appear in the destination bucket, the following issues might have prevented replication:
  - Amazon S3 doesn't replicate an object in a source bucket that is a replica created by another replication configuration. For example, if you set a replication configuration from bucket A to bucket B to bucket C, Amazon S3 doesn't replicate object replicas in bucket B to bucket C.
  - A source bucket owner can grant other AWS accounts permission to upload objects. By default, the source bucket owner doesn't have permissions for the objects created by other accounts. The replication configuration replicates only the objects for which the source bucket owner has access permissions. The source bucket owner can grant other AWS accounts permissions

to create objects conditionally, requiring explicit access permissions on those objects. For an example policy, see Grant cross-account permissions to upload objects while ensuring that the bucket owner has full control.

- Suppose that in the replication configuration, you add a rule to replicate a subset of objects that have a specific tag. In this case, you must assign the specific tag key and value at the time the object is created in order for Amazon S3 to replicate the object. If you first create an object and then add the tag to the existing object, Amazon S3 doesn't replicate the object.
- Use Amazon S3 Event Notifications to notify you of instances when objects do not replicate to their destination AWS Region. Amazon S3 event notifications are available through Amazon Simple Queue Service (Amazon SQS), Amazon Simple Notification Service (Amazon SNS), or AWS Lambda. For more information, see Receiving replication failure events with Amazon S3 Event Notifications.

  You can also view replication failure reasons by using Amazon S3 Event Notifications. To review the list of failure reasons, see Amazon S3 replication failure reasons.

## Batch Replication errors

To troubleshoot objects that aren't replicating to the destination bucket, check the different types of permissions for the your bucket, replication role, and IAM role that's used to create the Batch Replication job. Also, make sure to check the public access settings and bucket ownership settings.

While using Batch Replication, you might encounter one of these errors:

- Batch operation status is failed with reason: The job report could not be written to your report bucket.

  This error occurs if the IAM role that's used for the Batch Operations job is unable to put the completion report into the location that was specified when you created the job. To resolve this error, check that the IAM role has `PutObject` permissions for the bucket where you want to save the Batch Operations completion report. It's a best practice to deliver the report to a bucket different from the source bucket.
- Batch operation is completed with failures and Total failed is not 0.

  This error occurs if there are insufficient object permissions issues with the Batch Replication job that is running. If you're using a replication rule for your Batch Replication job, make sure that the IAM role used for replication has the proper permissions to access objects from either

the source or destination bucket. You can also check the Batch Replication completion report to review the specific Amazon S3 replication failure reason.

- Batch job ran successfully but the number of objects expected in destination bucket is not the same.

  This error occurs when there's a mismatch between the objects listed in the manifest that's supplied in the Batch Replication job and the filters that you selected when you created the job. You might also receive this message when the objects in your source bucket don't match any replication rules and aren't included in the generated manifest.

# Troubleshoot server access logging

The following topics can help you troubleshoot issues that you might encounter when setting up logging with Amazon S3.

**Topics**

- Common error messages when setting up logging
- Troubleshooting delivery failures

## Common error messages when setting up logging

The following common error messages can appear when you're enabling logging through the AWS Command Line Interface (AWS CLI) and AWS SDKs:

Error: Cross S3 location logging not allowed

If the destination bucket (also known as a *target bucket*) is in a different Region than the source bucket, a Cross S3 location logging not allowed error occurs. To resolve this error, make sure that the destination bucket configured to receive the access logs is in the same AWS Region and AWS account as the source bucket.

Error: The owner for the bucket to be logged and the target bucket must be the same

When you're enabling server access logging, this error occurs if the specified destination bucket belongs to a different account. To resolve this error, make sure that the destination bucket is in the same AWS account as the source bucket.

> **Note**
>
> We recommend that you choose a destination bucket that's different from the source bucket. When the source bucket and destination bucket are the same, additional logs are created for the logs that are written to the bucket, which can increase your storage bill. These extra logs about logs can also make it difficult to find the particular logs that you're looking for. For simpler log management, we recommend saving access logs in a different bucket. For more information, see the section called “How do I enable log delivery?”.

Error: The target bucket for logging does not exist

The destination bucket must exist prior to setting the configuration. This error indicates that the destination bucket doesn't exist or can't be found. Make sure that the bucket name is spelled correctly, and then try again.

Error: Target grants not allowed for bucket owner enforced buckets

This error indicates that the destination bucket uses the Bucket owner enforced setting for S3 Object Ownership. The Bucket owner enforced setting doesn't support destination (target) grants. For more information, see Permissions for log delivery.

## Troubleshooting delivery failures

To avoid server access logging issues, make sure that you're following these best practices:

- **The S3 log delivery group has write access to the destination bucket** – The S3 log delivery group delivers server access logs to the destination bucket. A bucket policy or bucket access control list (ACL) can be used to grant write access to the destination bucket. However, we recommend that you use a bucket policy instead of an ACL. For more information about how to grant write access to your destination bucket, see Permissions for log delivery.

  > **Note**
  >
  > If the destination bucket uses the Bucket owner enforced setting for Object Ownership, be aware of the following:
  >
  > - ACLs are disabled and no longer affect permissions. This means that you can't update your bucket ACL to grant access to the S3 log delivery group. Instead, to grant access

to the logging service principal, you must update the bucket policy for the destination bucket.

- You can't include destination grants in your `PutBucketLogging` configuration.

- **The bucket policy for the destination bucket allows access to the logs** – Check the bucket policy of the destination bucket. Search the bucket policy for any statements that contain `"Effect": "Deny"`. Then, verify that the `Deny` statement isn't preventing access logs from being written to the bucket.
- **S3 Object Lock isn't enabled on the destination bucket** – Check if the destination bucket has Object Lock enabled. Object Lock blocks server access log delivery. You must choose a destination bucket that doesn't have Object Lock enabled.
- **Amazon S3 managed keys (SSE-S3) is selected if default encryption is enabled on the destination bucket** – You can use default bucket encryption on the destination bucket only if you use server-side encryption with Amazon S3 managed keys (SSE-S3). Default server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS) is not supported for server access logging destination buckets. For more information about how to enable default encryption, see Configuring default encryption.
- **The destination bucket does not have Requester Pays enabled** – Using a Requester Pays bucket as the destination bucket for server access logging is not supported. To allow delivery of server access logs, disable the Requester Pays option on the destination bucket.
- **Review your AWS Organizations service control policy** – When you're using AWS Organizations, check the service control policies to make sure that Amazon S3 access is allowed. Service control policies specify the maximum permissions for the affected accounts. Search the service control policy for any statements that contain `"Effect": "Deny"` and verify that `Deny` statements aren't preventing any access logs from being written to the bucket. For more information, see Service control policies (SCPs) in the *AWS Organizations User Guide*.
- **Allow some time for recent logging configuration changes to take effect** – Enabling server access logging for the first time, or changing the destination bucket for logs, requires time to fully take effect. It might take longer than an hour for all requests to be properly logged and delivered.

  To check for log delivery failures, enable request metrics in Amazon CloudWatch. If the logs are not delivered within a few hours, look for the `4xxErrors` metric, which can indicate log delivery failures. For more information about enabling request metrics, see the section called “Creating a metrics configuration for all objects”.

# Troubleshoot versioning

The following topics can help you troubleshoot some common Amazon S3 versioning issues.

**Topics**

## I want to recover objects that were accidentally deleted in a versioning-enabled bucket

In general, when object versions are deleted from S3 buckets, there is no way for Amazon S3 to recover them. However, if you have enabled S3 Versioning on your S3 bucket, a DELETE request that doesn't specify a version ID cannot permanently delete an object. Instead, a delete marker is added as a placeholder. This delete marker becomes the current version of the object.

To verify whether your deleted objects are permanently deleted or temporarily deleted (with a delete marker in their place), do the following:

1. Sign in to the AWS Management Console and open the Amazon S3 console at https://console.aws.amazon.com/s3/.
2. In the left navigation pane, choose **Buckets**.
3. In the **Buckets** list, choose the name of the bucket that contains the object.
4. In the **Objects** list, Turn on the **Show versions** toggle to the right of the search bar, and then search for the deleted object in the search bar. This toggle is available only if versioning was previously enabled on the bucket.

   You can also use S3 Inventory to search for deleted objects.
5. If you can't find the object after toggling **Show versions** or creating an inventory report, and you also cannot find a delete marker of the object, the deletion is permanent and the object cannot be recovered.

You can also verify a deleted object's status by using the `HeadObject` API operation from the AWS Command Line Interface (AWS CLI). To do so, use the following `head-object` command and replace the *`user input placeholders`* with your own information:

```
aws s3api head-object --bucket amzn-s3-demo-bucket --key index.html
```

If you run the `head-object` command on a versioned object whose current version is a delete marker, you will receive a 404 Not Found error. For example:

An error occurred (404) when calling the HeadObject operation: Not Found

If you run the `head-object` command on a versioned object and provide the object's version ID, Amazon S3 retrieves the object's metadata, confirming that the object still exists and is not permanently deleted.

```
aws s3api head-object --bucket amzn-s3-demo-bucket --key index.html --
version-id versionID
```

```
{
"AcceptRanges": "bytes",
"ContentType": "text/html",
"LastModified": "Thu, 16 Apr 2015 18:19:14 GMT",
"ContentLength": 77,
"VersionId": "Zg5HyL7m.eZU9iM7AVlJkrqAiE.0UG4q",
"ETag": "\"30a6ec7e1a9ad79c203d05a589c8b400\"",
"Metadata": {}
}
```

If the object is found and the newest version is a delete marker, the previous version of the object still exists. Because the delete marker is the current version of the object, you can recover the object by deleting the delete marker.

After you permanently remove the delete marker, the second newest version of the object becomes the current version of the object, making your object available once again. For a visual depiction of how objects are recovered, see Removing delete markers.

To remove a specific version of an object, you must be the bucket owner. To delete a delete marker permanently, you must include its version ID in a `DeleteObject` request. To delete the delete marker, use the following command, and replace the *`user input placeholders`* with your own information:

```
aws s3api delete-object --bucket amzn-s3-demo-bucket --key index.html --
version-id versionID
```

For more information about the `delete-object` command, see delete-object in the *AWS CLI Command Reference*. For more information about permanently deleting delete markers, see Managing delete markers.

## I want to permanently delete versioned objects

In a versioning-enabled bucket, a `DELETE` request without a version ID cannot permanently delete an object. Instead, such a request inserts a delete marker.

To permanently delete versioned objects, you can choose from the following methods:

- Create an S3 Lifecycle rule to permanently delete noncurrent versions. To permanently delete noncurrent versions, select **Permanently delete noncurrent versions of objects**, and then enter a number under **Days after objects become noncurrent**. You can optionally specify the number of newer versions to retain by entering a value under **Number of newer versions to retain**. For more information about creating this rule, see Setting an S3 Lifecycle configuration.
- Delete a specified version by including the version ID in the `DELETE` request. For more information, see How to delete versioned objects permanently.
- Create a lifecycle rule to expire current versions. To expire current versions of objects, select **Expire current versions of objects**, and then add a number under **Days after object creation**. For more information about creating this lifecycle rule, see Setting an S3 Lifecycle configuration.
- To permanently delete all versioned objects and delete markers, create two lifecycle rules: one to expire current versions and permanently delete noncurrent versions of objects, and the other to delete expired object delete markers.

In a versioning-enabled bucket, a `DELETE` request that doesn't specify a version ID can remove only objects with a `NULL` version ID. If the object was uploaded when versioning was enabled, a `DELETE` request that doesn't specify a version ID creates a delete marker of that object.

> **Note**
>
> For S3 Object Lock-enabled buckets, a `DELETE` object request with a protected object version ID causes a 403 Access Denied error. A `DELETE` object request without a version ID adds a delete marker as the newest version of the object with a 200 OK response. Objects protected by Object Lock cannot be permanently deleted until their retention periods and

legal holds are removed. For more information, see the section called "How S3 Object Lock works".

## I'm experiencing performance degradation after enabling bucket versioning

Performance degradation can occur on versioning-enabled buckets if there are too many delete markers or versioned objects, and if best practices aren't followed.

**Too many delete markers**

After you enable versioning on a bucket, a `DELETE` request without a version ID made to an object creates a delete marker with a unique version ID. Lifecycle configurations with an **Expire current versions of objects** rule add a delete marker with a unique version ID to every object. Excessive delete markers can reduce performance in the bucket.

When versioning is suspended on a bucket, Amazon S3 marks the version ID as `NULL` on newly created objects. An expiration action in a versioning-suspended bucket causes Amazon S3 to create a delete marker with `NULL` as the version ID. In a versioning-suspended bucket, a `NULL` delete marker is created for any delete request. These `NULL` delete markers are also called expired object delete markers when all object versions are deleted and only a single delete marker remains. If too many `NULL` delete markers accumulate, performance degradation in the bucket occurs.

**Too many versioned objects**

If a versioning-enabled bucket contains objects with millions of versions, an increase in 503 Service Unavailable errors can occur. If you notice a significant increase in the number of HTTP 503 Service Unavailable responses received for `PUT` or `DELETE` object requests to a versioning-enabled bucket, you might have one or more objects in the bucket with millions of versions. When you have objects with millions of versions, Amazon S3 automatically throttles requests to the bucket. Throttling requests protects your bucket from an excessive amount of request traffic, which could potentially impede other requests made to the same bucket.

To determine which objects have millions of versions, use S3 Inventory. S3 Inventory generates a report that provides a flat file list of the objects in a bucket. For more information, see Amazon S3 Inventory.

To verify if there are high number of versioned objects in the bucket, use S3 Storage Lens metrics to view the **Current version object count**, **Noncurrent version object count**, and **Delete marker**

**object count**. For more information about Storage Lens metrics, see Amazon S3 Storage Lens metrics glossary.

The Amazon S3 team encourages customers to investigate applications that repeatedly overwrite the same object, potentially creating millions of versions for that object, to determine whether the application is working as intended. For instance, an application overwriting the same object every minute for a week can create over ten thousand versions. We recommend storing less than one hundred thousand versions for each object. If you have a use case that requires millions of versions for one or more objects, contact the AWS Support team for assistance with determining a better solution.

**Best practices**

To prevent versioning-related performance degradation issues, we recommend that you employ the following best practices:

- Enable a lifecycle rule to expire the previous versions of objects. For example, you can create a lifecycle rule to expire noncurrent versions after 30 days of the object being noncurrent. You can also retain multiple noncurrent versions if you don't want to delete all of them. For more information, see Setting an S3 Lifecycle configuration.
- Enable a lifecycle rule to delete expired object delete markers that don't have associated data objects in the bucket. For more information, see Removing expired object delete markers.

For additional Amazon S3 performance-optimization best practices, see Best practices design patterns.

# Getting Amazon S3 request IDs for AWS Support

Whenever you contact AWS Support because you've encountered errors or unexpected behavior in Amazon S3, you must provide the request IDs associated with the failed action. AWS Support uses these request IDs to help resolve the problems that you're experiencing.

Request IDs come in pairs, are returned in every response that Amazon S3 processes (even the erroneous ones), and can be accessed through verbose logs. There are a number of common methods for getting your request IDs, including S3 access logs and AWS CloudTrail events or data events.

After you've recovered these logs, copy and retain those two values, because you'll need them when you contact AWS Support. For information about contacting AWS Support, see Contact AWS or the AWS Support Documentation.

## Using HTTP to obtain request IDs

You can obtain your request IDs, `x-amz-request-id` and `x-amz-id-2` by logging the bits of an HTTP request before it reaches the target application. There are a variety of third-party tools that can be used to recover verbose logs for HTTP requests. Choose one that you trust, and then run the tool to listen on the port that your Amazon S3 traffic travels on, as you send out another Amazon S3 HTTP request.

For HTTP requests, the pair of request IDs will look like the following:

```
x-amz-request-id: 79104EXAMPLEB723
x-amz-id-2: IOWQ4fDEXAMPLEQM+ey7N9WgVhSnQ6JEXAMPLEZb7hSQDASK+Jd1vEXAMPLEa3Km
```

**Note**

HTTPS requests are encrypted and hidden in most packet captures.

## Using a web browser to obtain request IDs

Most web browsers have developer tools that you can use to view request headers.

For web browser-based requests that return an error, the pair of requests IDs will look like the following examples.

```
<Error><Code>AccessDenied</Code><Message>Access Denied</Message>
<RequestId>79104EXAMPLEB723</RequestId><HostId>IOWQ4fDEXAMPLEQM
+ey7N9WgVhSnQ6JEXAMPLEZb7hSQDASK+Jd1vEXAMPLEa3Km</HostId></Error>
```

To obtain the request ID pair from successful requests, use your browser's developer tools to look at the HTTP response headers. For information about developer tools for specific browsers, see *Amazon S3 Troubleshooting - How to recover your S3 request IDs* in AWS re:Post.

# Using the AWS SDKs to obtain request IDs

The following sections include information for configuring logging by using an AWS SDK. Although you can enable verbose logging on every request and response, we don't recommend enabling logging in production systems, because large requests or responses can significantly slow down an application.

For AWS SDK requests, the pair of request IDs will look like the following examples.

```
Status Code: 403, AWS Service: Amazon S3, AWS Request ID: 79104EXAMPLEB723
AWS Error Code: AccessDenied  AWS Error Message: Access Denied
S3 Extended Request ID: IOWQ4fDEXAMPLEQM+ey7N9WgVhSnQ6JEXAMPLEZb7hSQDASK
+Jd1vEXAMPLEa3Km
```

## Using the SDK for Go to obtain request IDs

You can configure logging by using SDK for Go. For more information, see Response metadata in the *SDK for Go V2 Developer Guide*.

## Using the SDK for PHP to obtain request IDs

You can configure logging by using PHP. For more information, see How can I see what data is sent over the wire? in the *AWS SDK for PHP Developer Guide*.

## Using the SDK for Java to obtain request IDs

You can enable logging for specific requests or responses to catch and return only the relevant headers. To do this, import the `com.amazonaws.services.s3.S3ResponseMetadata` class. Afterward, you can store the request in a variable before performing the actual request. To get the logged request or response, call `getCachedResponseMetadata(AmazonWebServiceRequest request).getRequestID()`.

### Example

```
PutObjectRequest req = new PutObjectRequest(bucketName, key, createSampleFile());
s3.putObject(req);
S3ResponseMetadata md = s3.getCachedResponseMetadata(req);
System.out.println("Host ID: " + md.getHostId() + " RequestID: " + md.getRequestId());
```

Alternatively, you can use verbose logging of every Java request and response. For more information, see Verbose Wire Logging in the *AWS SDK for Java Developer Guide*.

## Using the AWS SDK for .NET to obtain request IDs

You can configure logging with the AWS SDK for .NET by using the built-in `System.Diagnostics` logging tool. For more information, see the Logging with the AWS SDK for .NET *AWS Developer Blog* post.

> **Note**
>
> By default, the returned log contains only error information. To get the request IDs, the config file must have `AWSLogMetrics` (and optionally, `AWSResponseLogging`) added.

## Using the SDK for Python (Boto3) to obtain request IDs

With the AWS SDK for Python (Boto3), you can log specific responses. You can use this feature to capture only the relevant headers. The following code shows how to log parts of the response to a file:

```
import logging
import boto3
logging.basicConfig(filename='logfile.txt', level=logging.INFO)
logger = logging.getLogger(__name__)
s3 = boto3.resource('s3')
response = s3.Bucket(bucket_name).Object(object_key).put()
logger.info("HTTPStatusCode: %s", response['ResponseMetadata']['HTTPStatusCode'])
logger.info("RequestId: %s", response['ResponseMetadata']['RequestId'])
logger.info("HostId: %s", response['ResponseMetadata']['HostId'])
logger.info("Date: %s", response['ResponseMetadata']['HTTPHeaders']['date'])
```

You can also catch exceptions and log relevant information when an exception is raised. For more information, see Discerning useful information from error responses in the *AWS SDK for Python (Boto) API Reference*.

Additionally, you can configure Boto3 to output verbose debugging logs by using the following code:

```
import boto3
boto3.set_stream_logger('', logging.DEBUG)
```

For more information, see set_stream_logger in the *AWS SDK for Python (Boto) API Reference*.

### Using the SDK for Ruby to obtain request IDs

You can get your request IDs using the SDK for Ruby Versions 1, 2, or 3.

- **Using the SDK for Ruby - Version 1**– You can enable HTTP wire logging globally with the following line of code.

```
s3 = AWS::S3.new(:logger => Logger.new($stdout), :http_wire_trace => true)
```

- **Using the SDK for Ruby - Version 2 or Version 3**– You can enable HTTP wire logging globally with the following line of code.

```
s3 = Aws::S3::Client.new(:logger => Logger.new($stdout), :http_wire_trace => true)
```

For tips on getting wire information from an AWS client, see Debugging tip: Getting wire trace information from a client.

## Using the AWS CLI to obtain request IDs

To get your request IDs when using the AWS Command Line Interface (AWS CLI), add `--debug` to your command.

## Using Windows PowerShell to obtain request IDs

For information on recovering logs with Windows PowerShell, see the Response Logging in AWS Tools for Windows PowerShell .NET Development blog post.

## Using AWS CloudTrail data events to obtain request IDs

An Amazon S3 bucket that is configured with CloudTrail data events to log S3 object-level API operations provides detailed information about actions that are taken by a user, role, or an AWS service in Amazon S3. You can identify S3 request IDs by querying CloudTrail events with Athena.

## Using S3 server access logging to obtain request IDs

An Amazon S3 bucket configured for S3 server access logging provides detailed records for each request that is made to the bucket. You can identify S3 request IDs by querying the server access logs using Athena.

# Document history

- **Current API version:** 2006-03-01

The following table describes the important changes in each release of the *Amazon Simple Storage Service API Reference* and the *Amazon S3 User Guide*. For notification about updates to this documentation, you can subscribe to an RSS feed.

| Change | Description | Date |
| --- | --- | --- |
| Amazon S3 Select is no longer available to new customers. | Amazon S3 Select is no longer available to new customers. Existing customers of Amazon S3 Select can continue to use the feature as usual. Learn more | July 25, 2024 |
| Amazon S3 Inventory supports the s3:InventoryAccessibleOptionalFields condition key | Amazon S3 Inventory supports the s3:InventoryAccessibleOptionalFields condition key to control whether users can include optional metadata fields in their reports. For more information, see Control S3 Inventory report configuration creation. | February 20, 2024 |
| IPv6 support for S3 on Outposts | You can now access S3 on Outposts buckets using IPv6 via S3 on Outposts dual-stack endpoints. IPv6 support for S3 on Outposts allows you to manage your S3 on Outposts buckets and control plane resources over IPv6 networks. | January 16, 2024 |

| | | |
|---|---|---|
| New high-performance, single-zone Amazon S3 storage class – S3 Express One Zone | Amazon S3 Express One Zone is a high-performance, single-zone Amazon S3 storage class that is purpose-built to deliver consistent, single-digit millisecond data access for your most latency-sensitive applications. For more information, see S3 Express One Zone. | November 28, 2023 |
| Mountpoint for Amazon S3 adds support for S3 Express One Zone | You can now mount S3 Express One Zone directory buckets with Mountpoint. | November 28, 2023 |
| Lambda invocation schema version | Amazon S3 Batch Operations introduces a new Lambda invocation schema version for use with Batch Operations jobs that act on directory buckets. For more information, see Using Lambda and Amazon S3 batch operations with directory buckets. | November 28, 2023 |
| Import action for directory buckets | Amazon S3 introduces the import action. Import is a streamlined method for creating Amazon S3 Batch Operations jobs to copy objects from general purpose buckets to directory buckets. For more information, see Importing objects into a directory bucket. | November 28, 2023 |

| | | |
|---|---|---|
| Manage S3 access with S3 Access Grants | Amazon S3 Access Grants enables you to manage data permissions at scale for AWS Identity and Access Management (IAM) principals in addition to directory identities from corporate directories such as Azure AD. You can now enforce least-privilege S3 permissions and easily scale those permissions based on your business needs. For more information, see Managing access with S3 Access Grants. | November 26, 2023 |
| Mountpoint for Amazon S3 adds caching feature | With Mountpoint, you can now configure caching for repeatedly accessed data. | November 22, 2023 |
| Enhanced Amazon S3 Batch Operations manifest generation | You can now direct Amazon S3 Batch Operations to generate a manifest automatically based on object filter criteria that you specify when you create your job. This option is available for batch replication jobs that you create in the Amazon S3 console, or for any job type that you create by using the AWS CLI, AWS SDKs, or Amazon S3 REST API. For more information, see Creating an Amazon S3 Batch Operations job. | November 22, 2023 |

| | | |
|---|---|---|
| Existing Amazon S3 buckets can now add Object Lock configurations | You can now enable Object Lock on existing Amazon S3 bucket. You may set legal holds and retention periods for new or existing buckets. For more information, see Using Object Lock. | November 20, 2023 |
| S3 Storage Lens request metrics for prefixes | S3 Storage Lens introduces request metrics for prefixes within an Amazon S3 bucket. For more information, see Metrics categories. | November 17, 2023 |
| Amazon S3 Storage Lens groups | S3 Storage Lens introduces Storage Lens groups, a custom defined filter for objects based on object metadata. For more information, see Working with Amazon S3 Storage Lens groups. | November 15, 2023 |
| New IAM policy | S3 on Outposts introduces `AWSServiceRoleForS3OnOutposts`, a service-linked role to help manage network resources for you. For more information, see Using service-linked roles for S3 on Outposts. | October 3, 2023 |

| | | |
|---|---|---|
| Amazon S3 provides the `Last-Modified` time for delete markers | Amazon S3 provides the `Last-Modified` time of delete markers in the response headers of S3 `Head` and `Get` API operations. For more information, see Working with delete markers. | September 27, 2023 |
| Amazon S3 update to AWS managed policy | Amazon S3 added `s3:Describe*` permissions to `AmazonS3ReadOnlyAccess`. For more information, see AWS managed policies for Amazon S3. | August 11, 2023 |
| Improved start times for Standard restore requests made through S3 Batch Operations | Standard retrievals for restore requests that are made through S3 Batch Operations now can start within minutes. For more information, see Archive Retrieval Options. | August 9, 2023 |
| Added Mountpoint, a high-throughput client for mounting an Amazon S3 bucket as a local file system. | With Mountpoint, your applications can access objects stored in Amazon S3 through file operations, giving your applications access to the elastic storage and throughput of Amazon S3 through a file interface. | August 9, 2023 |

| | | |
|---|---|---|
| Dual-layer server-side encryption with AWS Key Management Service keys (DSSE-KMS) | Dual-layer server-side encryption with AWS Key Management Service (AWS KMS) keys (DSSE-KMS) applies two layers of encryption to objects when they are uploaded to Amazon S3. For more information, see Using dual-layer server-side encryption with AWS KMS keys. | June 13, 2023 |
| Amazon S3 enables S3 Block Public Access and disables S3 access control lists (ACLs) for all new buckets. | Amazon S3 now automatically enables S3 Block Public Access and disables S3 access control lists (ACLs) for all new S3 buckets in all AWS Regions. For more information, see Blocking public access to your Amazon S3 storage and Controlling ownership of objects and disabling ACLs for your bucket. | April 27, 2023 |
| S3 Replication Operations Failed metric | Amazon S3 adds new Amazon CloudWatch metric to monitor S3 Replication failures. For more information, see Monitoring progress with replication metrics. | April 5, 2023 |
| Private DNS | AWS PrivateLink for Amazon S3 now supports Private DNS. For more information, see Private DNS. | March 14, 2023 |

| | | |
|---|---|---|
| Cross-account access points support in the Amazon S3 console | Amazon S3 now supports creating cross-account access points with the Amazon S3 console. For more information, see Creating access points. | March 14, 2023 |
| Amazon S3 on Outposts supports S3 Replication on Outposts | With local S3 Replication, you can automatically replicate objects to a single Outposts destination bucket or to multiple destination buckets. The destination buckets can be in different AWS Outposts or within the same Outposts as the source bucket. For more information, see Replicating objects for S3 on Outposts. | March 14, 2023 |
| Amazon S3 Object Lambda Access Point alias | When you create an Object Lambda Access Point, Amazon S3 automatically generates a unique alias for your Object Lambda Access Point. You can use this alias instead of an Amazon S3 bucket name or the Object Lambda Access Point Amazon Resource Name (ARN) in a request for access point data plane operations. For more information, see How to use a bucket-style alias for your Object Lambda Access Point. | March 14, 2023 |

| | | |
|---|---|---|
| Amazon S3 Multi-Region Access Points cross-account support | Amazon S3 now supports creating cross-account Multi-Region Access Points with the Amazon S3 console. For more information, see Creating Multi-Region Access Points. | March 14, 2023 |
| Cross-account access points | Amazon S3 supports creating cross-account access points. You can create a cross-account access point by using the AWS Command Line Interface (AWS CLI) or the REST API `CreateAccessPoint` operation. For more information, see Creating access points. | November 30, 2022 |
| Amazon S3 supports failover controls for Amazon S3 Multi-Region Access Points | Amazon S3 introduces failover control for Multi-Region Access Points. These controls let you shift S3 data access request traffic routed through an Amazon S3 Multi-Region Access Point to an alternate AWS Region within minutes to test and build highly available applications. For more information, see Amazon S3 Multi-Region Access Point failover controls. | November 28, 2022 |

| | | |
|---|---|---|
| Amazon S3 Storage Lens increases organization-wide visibility with 34 new metrics | S3 Storage Lens introduces 34 additional metrics to uncover deeper cost-optimization opportunities, identify data-protection best practices, and improve the performan ce of application workflows. For more information, see S3 Storage Lens metrics. | November 17, 2022 |
| Amazon S3 supports higher restore request rates for S3 Glacier Flexible Retrieval and S3 Glacier Deep Archive | Amazon S3 supports restore requests at a rate of up to 1,000 transactions per second, per AWS account for the S3 Glacier Flexible Retrieval and S3 Glacier Deep Archive storage classes. | November 15, 2022 |
| Amazon S3 on Outposts supports additional S3 Lifecycle actions and filters | S3 on Outposts supports additional S3 Lifecycle rules to optimize capacity mana gement. You can expire objects as they age or are replaced with newer version s. You can create a lifecycle rule for a whole bucket or a subset of objects in a bucket by filtering with prefixes, object tags, or object size. For more information, see Creating and managing a lifecycle configuration. | November 2, 2022 |

| | | |
|---|---|---|
| S3 Replication support for SSE-C objects | You can replicate objects that are created using server-side encryption with customer -provided keys. For more information about replicating encrypted objects, see Replicating objects created with server-side encryption (SSE-C, SSE-S3, SSE-KMS). | October 24, 2022 |
| Amazon S3 on Outposts supports access point aliases | With S3 on Outposts, you must use access points to access any object in an Outposts bucket. Every time you create an access point for a bucket, S3 on Outposts automatically generates an access point alias. You can use this access point alias instead of an access point ARN for any data plane operation. For more information, see Using a bucket-style alias for your S3 on Outposts bucket access point. | October 21, 2022 |
| S3 Object Lambda supports the `HeadObject`, `ListObjects`, and `ListObjectsV2` operations | You can use custom code to modify the data returned by standard S3 `GET`, `LIST`, or `HEAD` requests to filter rows, dynamically resize images, redact confidential data, and more. For more information, see Transforming objects with S3 Object Lambda. | October 4, 2022 |

| | | |
|---|---|---|
| Amazon S3 on Outposts supports S3 Versioning | When enabled, S3 Versioning saves multiple distinct copies of an object in the same bucket. You can use S3 Versioning to preserve, retrieve, and restore every version of every object stored in your Outposts buckets. S3 Versioning helps you recover from unintended user actions and application failures. For more information, see Managing S3 Versioning for your S3 on Outposts bucket. | September 21, 2022 |
| AWS Backup for Amazon S3 | AWS Backup is a fully managed, policy-based service that you can use to define a central backup policy to protect your Amazon S3 data. For more information, see Using AWS Backup for Amazon S3. | February 18, 2022 |

| | | |
|---|---|---|
| Use S3 Batch Replication to replicate existing objects | With S3 Batch Replication, you can replicate objects that existed before a replication configuration was in place. Replicating existing objects is done through the use of a Batch Operations job. S3 Batch Replication differs from live replication, which continuously and automatic ally copies new objects across Amazon S3 buckets. For more information, see Replicating existing objects with S3 Batch Replication. | February 8, 2022 |
| Rename of S3 Glacier Flexible Retrieval | The Glacier storage class has been renamed to S3 Glacier Flexible Retrieval. This change does not impact the API. | November 30, 2021 |

| | | |
|---|---|---|
| New S3 Object Ownership setting to disable ACLs | You can apply the bucket owner enforced setting for Object Ownership to disable ACLs for your bucket and the objects in it and take ownership of every object in your bucket. The bucket owner enforced setting simplifies access management for data stored in Amazon S3. For more information, see Controlling ownership of objects and disabling ACLs for your bucket. | November 30, 2021 |
| New S3 Intelligent-Tiering storage class | S3 Intelligent-Tiering Archive Instant Access is an additional storage class under S3 Intelligent-Tiering. For more information, see How S3 Intelligent-Tiering works. | November 30, 2021 |
| New S3 Glacier Instant Retrieval storage class | You can now place objects in the S3 Glacier Instant Retrieval storage class. For more information about this storage class, see Using Amazon S3 storage classes. | November 30, 2021 |

| | | |
|---|---|---|
| AWS Backup for Amazon S3 Preview | AWS Backup is a fully managed, policy-based service that you can use to define a central backup policy to protect your Amazon S3 data. For more information see, Using AWS Backup for Amazon S3. | November 30, 2021 |
| AWS Identity and Access Management Access Analyzer for Amazon S3 | IAM Access Analyzer runs policy checks to validate your policy against IAM policy grammar and best practices. To learn more about validating policies using IAM Access Analyzer, see IAM Access Analyzer policy validation in the *IAM User Guide*. | November 30, 2021 |
| New event types | New event types added to Amazon S3 Event Notifications, see Amazon S3 Event Notifications. | November 29, 2021 |
| Enable Amazon EventBridge on buckets | You can enable EventBridge on Amazon S3 buckets to send events to Amazon EventBridge, see Using EventBridge. | November 29, 2021 |
| New S3 Lifecycle filters | You can create lifecycle rules based on object size or specify how many noncurrent object versions to keep. For more information, see Examples of S3 Lifecycle configuration. | November 23, 2021 |

| | | |
|---|---|---|
| Publish Amazon S3 Storage Lens metrics to Amazon CloudWatch | You can publish S3 Storage Lens usage and activity metrics to Amazon CloudWatch to create a unified view of your operational health in CloudWatch dashboards. You can also use CloudWatch features, like alarms and triggered actions, metric math, and anomaly detection, to monitor and take action on S3 Storage Lens metrics. In addition, the CloudWatch APIs enable applications, including third-party providers, to access your S3 Storage Lens metrics. For more information, see the Monitor S3 Storage Lens metrics in CloudWatch. | November 22, 2021 |
| Multi-Region Access Points | You can use Multi-Region Access Points to create a global endpoint that applications can use to fulfill requests from Amazon S3 buckets located in multiple AWS Regions. You can use this Multi-Region Access Point to route data to a bucket with the lowest latency. For more information about Multi-Region Access Points and how to use them, see Multi-Region Access Point in Amazon S3. | September 2, 2021 |

| | | |
|---|---|---|
| Amazon S3 on Outposts adds direct local access for applications | Run your applications outside the AWS Outposts virtual private cloud (VPC) and access your S3 on Outposts data. You can also access S3 on Outposts objects directly from your on-premises network. For more information about configuring S3 on Outposts endpoints using customer-owned IP (CoIP) addresses and accessing your objects by creating a local gateway from your on-premises network, see Accessing Amazon S3 on Outposts using VPC-only access points. | July 29, 2021 |
| Amazon S3 access point alias | When you create an access point, Amazon S3 automatically generates an alias that you can use instead of a bucket name for data access. You can use this access point alias instead of an Amazon Resource Name (ARN) for any access point data plane operation. For more information, see Using a bucket-style alias for your access point. | July 26, 2021 |

| | | |
|---|---|---|
| Amazon S3 Inventory and S3 Batch Operations support S3 Bucket Key status | Amazon S3 Inventory and Batch Operations support identifying and copying existing objects with S3 Bucket Keys. S3 Bucket Keys accelerate the reduction of server-side encryption costs for existing objects. For more information, see Amazon S3 Inventory and Batch Operations Copy object. | June 3, 2021 |
| Amazon S3 Storage Lens metrics account snapshot | The S3 Storage Lens account snapshot displays your total storage, object count, and average object size on the S3 console home (**Buckets**) page by summarizing metrics from your default dashboard. For more information, see S3 Storage Lens metrics account snapshot. | May 5, 2021 |
| Increased Amazon S3 on Outposts endpoint support | S3 on Outposts now supports up to 100 endpoints per Outpost. For more information, see S3 on Outposts network restrictions. | April 29, 2021 |

| | | |
|---|---|---|
| Amazon S3 on Outposts event notifications in Amazon CloudWatch Events | You can use CloudWatch Events to create a rule to capture any S3 on Outposts API event and get notified through all supported CloudWatch targets. For more information, see Receiving S3 on Outposts event notifications using CloudWatch Events. | April 19, 2021 |
| S3 Object Lambda | With S3 Object Lambda, you can add your own code to Amazon S3 GET requests to modify and process data as it is returned to an application. You can use custom code to modify the data returned by standard S3 GET requests to filter rows, dynamically resize images, redact confidential data, and more. For more information, see Transforming objects. | March 18, 2021 |

| | | |
|---|---|---|
| AWS PrivateLink | With AWS PrivateLink for Amazon S3, you can connect directly to S3 by using an interface endpoint in your virtual private cloud (VPC) instead of connecting over the internet. Interface endpoints are directly accessible from applications that are on premises or in a different AWS Region. For more information, see AWS PrivateLink for Amazon S3. | February 2, 2021 |
| Managing Amazon S3 on Outposts capacity with AWS CloudTrail | S3 on Outposts management events are available through CloudTrail logs. For more information, see Managing S3 on Outposts capacity with CloudTrail. | December 21, 2020 |
| Strong consistency | Amazon S3 provides strong read-after-write consistency for PUT and DELETE requests of objects in your S3 bucket in all AWS Regions. In addition, read operations on Amazon S3 Select, Amazon S3 access control lists, Amazon S3 Object Tags, and object metadata (for example, HEAD object) are strongly consistent. For more information, see Amazon S3 data consistency model. | December 1, 2020 |

| | | |
|---|---|---|
| Amazon S3 replica modification sync | Amazon S3 replica modification sync keeps object metadata, such as tags, ACLs, and Object Lock settings, in sync between source objects and replicas. When this feature is enabled, Amazon S3 replicates metadata changes made to either the source object or the replica copies. For more information, see Replicating metadata changes with replica modification sync. | December 1, 2020 |
| Amazon S3 Bucket Keys | Amazon S3 Bucket Keys reduce the cost of Amazon S3 server-side encryption with AWS Key Management Service (SSE-KMS). This new bucket-level key for server-side encryption can reduce AWS KMS request costs by up to 99 percent by decreasing the request traffic from Amazon S3 to AWS KMS. For more information, see Reducing the cost of SSE-KMS by using S3 Bucket Keys. | December 1, 2020 |

| | | |
|---|---|---|
| Amazon S3 Storage Lens | S3 Storage Lens aggregates your metrics and displays the information in the **Account snapshot** section on the Amazon S3 console **Buckets** page. S3 Storage Lens also provides an interactive dashboard that you can use to visualize insights and trends, flag outliers, and receive recommendations for optimizing storage costs and applying data-protection best practices. Your dashboard has drill-down options to generate and visualize insights at the organization, account, AWS Region, storage class, bucket, prefix, or Storage Lens group level. You can also send a daily metrics export in CSV or Parquet format to an S3 bucket. For more information, see Assessing your storage activity and usage with S3 Storage Lens. | November 18, 2020 |
| Tracing S3 requests using AWS X-Ray | Amazon S3 integrates with X-Ray to propagate the trace context and give you one request chain with upstream and downstream nodes. For more information, see Tracing requests using X-Ray. | November 16, 2020 |

| | | |
|---|---|---|
| S3 Replication metrics | S3 Replication metrics provide detailed metrics for the replication rules in your replication configuration. For more information, see Replication metrics and Amazon S3 event notifications. | November 9, 2020 |
| S3 Intelligent-Tiering Archive Access and Deep Archive Access | S3 Intelligent-Tiering Archive Access and Deep Archive Access are additional storage tiers under S3 Intelligent-Tiering. For more information, see Storage class for automatically optimizing frequently and infrequently accessed objects . | November 9, 2020 |
| Delete marker replication | With delete marker replication, you can ensure that delete markers are copied to your destination buckets for your replication rules. For more information, see Using delete marker replication. | November 9, 2020 |
| S3 Object Ownership | Object Ownership is an S3 bucket setting that you can use to control ownership of new objects that are uploaded to your buckets. For more information, see Using S3 Object Ownership. | October 2, 2020 |

| | | |
|---|---|---|
| Amazon S3 on Outposts | With Amazon S3 on Outposts, you can create S3 buckets on your AWS Outposts resources and easily store and retrieve objects on-premises for applications that require local data access, local data processing, and data residency. You can use S3 on Outposts through the AWS Management Console, AWS CLI, AWS SDKs, or REST API. For more information, see Using Amazon S3 on Outposts. | September 30, 2020 |
| Bucket owner condition | You can use the Amazon S3 bucket owner condition to ensure that the buckets you use in your S3 operations belong to the AWS accounts that you expect. For more information, see Bucket owner condition. | September 11, 2020 |
| S3 Batch Operations support for Object Lock Retention | You can now use Batch Operations with S3 Object Lock to apply retention settings to many Amazon S3 objects at once. For more information, see Setting S3 Object Lock Retention dates with S3 Batch Operations. | May 4, 2020 |

| | | |
|---|---|---|
| S3 Batch Operations support for Object Lock Legal Hold | You can now use Batch Operations with S3 Object Lock to add a legal hold to many Amazon S3 objects at once. For more information, see Using S3 Batch Operations for setting S3 Object Lock Legal Hold. | May 4, 2020 |
| Job tags for S3 Batch Operations | You can add tags to your S3 Batch Operations jobs to control and label those jobs. For more information, see Tags for S3 Batch Operations jobs. | March 16, 2020 |
| Amazon S3 access points | Amazon S3 access points simplify managing data access at scale for shared datasets in S3. Access points are named network endpoints that are attached to buckets that you can use to perform S3 object operations. For more information, see Managing data access with Amazon S3 access points. | December 2, 2019 |

| | | |
|---|---|---|
| Access Analyzer for Amazon S3 | Access Analyzer for Amazon S3 alerts you to S3 buckets that are configured to allow access to anyone on the internet or other AWS accounts, including accounts outside of your organization. For more information, see Using Access Analyzer for Amazon S3. | December 2, 2019 |
| S3 Replication Time Control (S3 RTC) | S3 Replication Time Control (S3 RTC) replicates most objects that you upload to Amazon S3 in seconds, and 99.99 percent of those objects within 15 minutes. For more information, see Replicating objects using S3 Replication Time Control (S3 RTC). | November 20, 2019 |
| Same-Region Replication | You can use Same-Region Replication (SRR) to copy objects across Amazon S3 buckets in the same AWS Region. For information about both Cross-Region Replication (CRR) and Same-Region Replication, see Replication. | September 18, 2019 |
| Cross-Region Replication support for S3 Object Lock | Cross-Region Replication now supports Object Lock. For more information, see What does Amazon S3 Replicate?. | May 28, 2019 |

| | | |
|---|---|---|
| S3 Batch Operations | By using S3 Batch Operations, you can perform large-scale Batch Operations on Amazon S3 objects. S3 Batch Operations can run a single operation on lists of objects that you specify. A single job can perform the specified operation on billions of objects containing exabytes of data. For more information, see Performing S3 Batch Operations. | April 30, 2019 |
| Asia Pacific (Hong Kong) Region | Amazon S3 is now available in the Asia Pacific (Hong Kong) Region. For more information about Amazon S3 Regions and endpoints, see Regions and endpoints in the *AWS General Reference*. | April 24, 2019 |
| Added a new field to the server access logs | Amazon S3 added the following new field to the server access logs: Transport Layer Security (TLS) version. For more information, see Server access log format. | March 28, 2019 |
| New archive storage class | Amazon S3 now offers a new archive storage class, S3 Glacier Deep Archive (`DEEP_ARCHIVE`), for storing rarely accessed objects. For more information, see Storage Classes. | March 27, 2019 |

| | | |
|---|---|---|
| Added new fields to the server access logs | Amazon S3 added the following new fields to the server access logs: Host Id, Signature Version, Cipher Suite, Authentication Type, and Host Header. For more information, see Server access log format. | March 5, 2019 |
| Support for Parquet-formatted Amazon S3 Inventory files | Amazon S3 now supports the Apache Parquet (Parquet) format in addition to the Apache optimized row columnar (ORC) and comma-separated values (CSV) file formats for inventory output files. For more information, see Inventory. | December 4, 2018 |
| S3 Object Lock | Amazon S3 now offers Object Lock functionality that provides Write Once Read Many (WORM) protections for Amazon S3 objects. For more information, see Locking Objects. | November 26, 2018 |
| Restore speed upgrade | Using Amazon S3 restore speed upgrade, you can change the speed of a restoration from the S3 Glacier Flexible Retrieval storage class to a faster speed while the restoration is in progress. For more information, see Restoring Archived Objects. | November 26, 2018 |

| | | |
|---|---|---|
| Restore Event Notifications | Amazon S3 Event Notifications now support initiation and completion events when restoring objects from the S3 Glacier Flexible Retrieval storage class. For more information, see Event Notifications. | November 26, 2018 |

| | | |
|---|---|---|
| PUT directly to the S3 Glacier Flexible Retrieval storage class | The Amazon S3 PUT operation now supports specifying S3 Glacier Flexible Retrieval as the storage class when creating objects. Previously, you had to transition objects to the S3 Glacier Flexible Retrieval storage class from another Amazon S3 storage class. Also, when using S3 Cross-Region Replication (CRR), you can now specify S3 Glacier Flexible Retrieval as the storage class for replicated objects. For more information about the S3 Glacier Flexible Retrieval storage class, see Storage Classes. For more information about specifying the storage class for replicated objects, Replication Configuration Overview. For more informati on about the direct PUT to S3 Glacier Flexible Retrieval REST API changes, see Document History: PUT directly to S3 Glacier Flexible Retrieval . | November 26, 2018 |

| | | |
|---|---|---|
| New storage class | Amazon S3 now offers a new storage class named S3 Intelligent-Tiering ( `INTELLIGENT_TIERING` ) that is designed for long-lived data with changing or unknown access patterns. For more information, see Storage Classes. | November 26, 2018 |
| Amazon S3 Block Public Access | Amazon S3 now includes the ability to block public access to buckets and objects on a per-bucket or account-wide basis. For more information, see Using Amazon S3 Block Public Access. | November 15, 2018 |
| Filtering enhancements in Cross-Region Replication (CRR) rules | In a CRR rule configuration, you can specify an object filter to choose a subset of objects to apply the rule to. Previously, you could filter only on an object key prefix. In this release, you can filter on an object key prefix, one or more object tags, or both. For more information, see CRR Setup: Replication Configuration Overview. | September 19, 2018 |

| | | |
|---|---|---|
| New Amazon S3 Select features | Amazon S3 Select now supports Apache Parquet input, queries on nested JSON objects, and two new Amazon CloudWatch monitoring metrics (`SelectScannedBytes` and `SelectReturnedBytes`). | September 5, 2018 |
| Updates now available over RSS | You can now subscribe to an RSS feed to receive notifications about updates to the *Amazon S3 User Guide*. | June 19, 2018 |

# Earlier updates

The following table describes the important changes in each release of the *Amazon S3 User Guide* before June 19, 2018.

| Change | Description | Date |
|---|---|---|
| Code examples update | Code examples updated:<br>• C#—Updated all of the examples to use the task-based asynchronous pattern. For more information, see Amazon Web Services Asynchronous APIs for .NET in the *AWS SDK for .NET Developer Guide*. Code examples are now compliant with version 3 of the AWS SDK for .NET.<br>• Java—Updated all of the examples to use the client builder model. For more information about the client builder model, see Creating Service Clients.<br>• | April 30, 2018 |

| Change | Description | Date |
| --- | --- | --- |
| | PHP—Updated all of the examples to use the AWS SDK for PHP 3.0. For more information about the AWS SDK for PHP 3.0, see AWS SDK for PHP.<br>• Ruby—Updated example code so that the examples work with the AWS SDK for Ruby version 3. | |
| Amazon S3 now reports S3 Glacier Flexible Retrieval and ONEZONE_IA storage classes to Amazon CloudWatch Logs storage metrics | In addition to reporting actual bytes, these storage metrics include per-object overhead bytes for applicable storage classes (ONEZONE_IA , STANDARD_IA , and S3 Glacier Flexible Retrieval ):<br>• For ONEZONE_IA and STANDARD_IA storage class objects, Amazon S3 reports objects smaller than 128 KB as 128 KB. For more information, see Using Amazon S3 storage classes.<br>• For S3 Glacier Flexible Retrieval storage class objects, the storage metrics report the following overheads:<br>  • A 32 KB per-object overhead, charged at S3 Glacier Flexible Retrieval storage class pricing<br>  • An 8 KB per-object overhead, charged at STANDARD storage class pricing<br>  For more information, see Transitioning objects using Amazon S3 Lifecycle.<br>For more information about storage metrics, see Monitoring metrics with Amazon CloudWatch. | April 30, 2018 |

| Change | Description | Date |
| --- | --- | --- |
| New storage class | Amazon S3 now offers a new storage class, `STANDARD_IA` (IA, for infrequent access) for storing objects. This storage class is optimized for long-lived and less frequently accessed data. For more information, see Using Amazon S3 storage classes. | April 4, 2018 |
| Amazon S3 Select | Amazon S3 now supports retrieving object content based on an SQL expression. For more information, see Filtering and retrieving data using Amazon S3 Select. | April 4, 2018 |
| Asia Pacific (Osaka-Local) Region | Amazon S3 is now available in the Asia Pacific (Osaka-Local) Region. For more information about Amazon S3 Regions and endpoints, see Regions and Endpoints in the *AWS General Reference*.<br><br>**Important**<br>You can use the Asia Pacific (Osaka-Local) Region only in conjunction with the Asia Pacific (Tokyo) Region. To request access to Asia Pacific (Osaka-Local) Region, contact your sales representative. | February 12, 2018 |
| Amazon S3 Inventory creation timestamp | Amazon S3 Inventory now includes a timestamp of the date and start time of the creation of the Amazon S3 Inventory report. You can use the timestamp to determine changes in your Amazon S3 storage from the start time of when the inventory report was generated. | January 16, 2018 |
| Europe (Paris) Region | Amazon S3 is now available in the Europe (Paris) Region. For more information about Amazon S3 Regions and endpoints, see Regions and Endpoints in the *AWS General Reference*. | December 18, 2017 |

| Change | Description | Date |
| --- | --- | --- |
| China (Ningxia) Region | Amazon S3 is now available in the China (Ningxia) Region. For more information about Amazon S3 Regions and endpoints, see Regions and Endpoints in the *AWS General Reference*. | November 29, 2017 |
| Support for ORC-formatted Amazon S3 Inventory files | Amazon S3 now supports the Apache optimized row columnar (ORC) format in addition to comma-separated values (CSV) file format for inventory output files. Also, you can now query Amazon S3 inventory using standard SQL by using Amazon Athena, Amazon Redshift Spectrum, and other tools such as Presto, Apache Hive, and Apache Spark. For more information, see Amazon S3 Inventory. | November 17, 2017 |
| Default encryption for S3 buckets | Amazon S3 default encryption provides a way to set the default encryption behavior for an S3 bucket. You can set default encryption on a bucket so that all objects are encrypted when they are stored in the bucket. The objects are encrypted using server-side encryption with either Amazon S3 managed keys (SSE-S3) or AWS managed keys (SSE-KMS). For more information, see Setting default server-side encryption behavior for Amazon S3 buckets. | November 06, 2017 |
| Encryption status in Amazon S3 Inventory | Amazon S3 now supports including encryption status in Amazon S3 Inventory so you can see how your objects are encrypted at rest for compliance auditing or other purposes. You can also configure to encrypt Amazon S3 Inventory with server-side encryption (SSE) or SSE-KMS so that all inventory files are encrypted accordingly. For more information, see Amazon S3 Inventory. | November 06, 2017 |

| Change | Description | Date |
| --- | --- | --- |
| Cross-Region Replication (CRR) enhancements | Cross-Region Replication now supports the following:<br>• In a cross-account scenario, you can add a CRR configuration to change replica ownership to the AWS account that owns the destination bucket. For more information, see Changing the replica owner.<br>• By default, Amazon S3 does not replicate objects in your source bucket that are created using server-side encryption using keys stored in AWS KMS In your CRR configuration, you can now direct Amazon S3 to replicate these objects. For more information, see Replicating encrypted objects (SSE-C, SSE-S3, SSE-KMS, DSSE-KMS). | November 06, 2017 |
| Europe (London) Region | Amazon S3 is now available in the Europe (London) Region. For more information about Amazon S3 Regions and endpoints, see Regions and Endpoints in the *AWS General Reference*. | December 13, 2016 |
| Canada (Central) Region | Amazon S3 is now available in the Canada (Central) Region. For more information about Amazon S3 Regions and endpoints, see Regions and Endpoints in the *AWS General Reference*. | December 8, 2016 |

| Change | Description | Date |
| --- | --- | --- |
| Object tagging | Amazon S3 now supports object tagging. Object tagging enables you to categorize storage. Object key name prefixes also enable you to categorize storage, object tagging adds another dimension to it.<br><br>There are added benefits tagging offers. These include:<br><br>• Object tags enable fine-grained access control of permissions (for example, you could grant an IAM user permissions to read-only objects with specific tags).<br>• Fine-grained control in specifying lifecycle configuration. You can specify tags to select a subset of objects to which lifecycle rule applies.<br>• If you have Cross-Region Replication (CRR) configured, Amazon S3 can replicate the tags. You must grant necessary permission to the IAM role created for Amazon S3 to assume to replicate objects on your behalf.<br>• You can also customize CloudWatch metrics and CloudTrail events to display information by specific tag filters.<br><br>For more information, see Categorizing your storage using tags. | November 29, 2016 |
| Amazon S3 Lifecycle now supports tag-based filters | Amazon S3 now supports tag-based filtering in lifecycle configuration. You can now specify lifecycle rules in which you can specify a key prefix, one or more object tags, or a combination of both to select a subset of objects to which the lifecycle rule applies. For more information, see Managing your storage lifecycle. | November 29, 2016 |

| Change | Description | Date |
| --- | --- | --- |
| CloudWatch request metrics for buckets | Amazon S3 now supports CloudWatch metrics for requests made on buckets. When you enable these metrics for a bucket, the metrics report at 1-minut e intervals. You can also configure which objects in a bucket will report these request metrics. For more information, see Monitoring metrics with Amazon CloudWatch. | November 29, 2016 |
| Amazon S3 Inventory | Amazon S3 now supports storage inventory. Amazon S3 Inventory provides a flat-file output of your objects and their corresponding metadata on a daily or weekly basis for an S3 bucket or a shared prefix (that is, objects that have names that begin with a common string).<br><br>For more information, see Amazon S3 Inventory. | November 29, 2016 |
| Amazon S3 Analytics – Storage Class Analysis | The new Amazon S3 analytics – storage class analysis feature observes data access patterns to help you determine when to transition less frequently accessed `STANDARD` storage to the `STANDARD_IA` (IA, for infrequent access) storage class. After storage class analysis observes the infrequent access patterns of a filtered set of data over a period of time, you can use the analysis results to help you improve your lifecycle configurations. This feature also includes a detailed daily analysis of your storage usage at the specified bucket, pr efix, or tag level that you can export to an S3 bucket. | November 29, 2016 |
| New Expedited and Bulk data retrieval s when restoring archived objects from S3 Glacier | Amazon S3 now supports Expedited and Bulk data retrievals in addition to Standard retrievals when restoring objects archived to S3 Glacier. For more information, see Restoring an archived object. | November 21, 2016 |

| Change | Description | Date |
| --- | --- | --- |
| CloudTrail object logging | CloudTrail supports logging Amazon S3 object level API operations such as `GetObject`, `PutObject`, and `DeleteObject`. You can configure your event selectors to log object level API operations. For more information, see Logging Amazon S3 API calls using AWS CloudTrail. | November 21, 2016 |
| US East (Ohio) Region | Amazon S3 is now available in the US East (Ohio) Region. For more information about Amazon S3 Regions and endpoints, see Regions and Endpoints in the *AWS General Reference*. | October 17, 2016 |
| IPv6 support for Amazon S3 Transfer Acceleration | Amazon S3 now supports Internet Protocol version 6 (IPv6) for Amazon S3 Transfer Acceleration. You can connect to Amazon S3 over IPv6 by using the new dual-stack for Transfer Acceleration endpoint. For more information, see Getting started with Amazon S3 Transfer Acceleration. | October 6, 2016 |
| IPv6 support | Amazon S3 now supports Internet Protocol version 6 (IPv6). You can access Amazon S3 over IPv6 by using dual-stack endpoints. For more information, see Making requests to Amazon S3 over IPv6. | August 11, 2016 |
| Asia Pacific (Mumbai) Region | Amazon S3 is now available in the Asia Pacific (Mumbai) Region. For more information about Amazon S3 Regions and endpoints, see Regions and Endpoints in the *AWS General Reference*. | June 27, 2016 |
| Amazon S3 Transfer Acceleration | Amazon S3 Transfer Acceleration enables fast, easy, and secure transfers of files over long distances between your client and an S3 bucket. Transfer Acceleration takes advantage of Amazon CloudFront globally distributed edge locations.<br><br>For more information, see Configuring fast, secure file transfers using Amazon S3 Transfer Acceleration. | April 19, 2016 |

| Change | Description | Date |
| --- | --- | --- |
| Lifecycle support to remove expired object delete markers | Lifecycle configuration `Expiration` action now allows you to direct Amazon S3 to remove expired object delete markers in a/ versioned bucket. For more information, see Elements to describe lifecycle actions. | March 16, 2016 |

| Change | Description | Date |
| --- | --- | --- |
| Bucket lifecycle configuration now supports action to stop incomplete multipart uploads | Bucket lifecycle configuration now supports the `AbortIncompleteMultipartUpload` action that you can use to direct Amazon S3 to stop multipart uploads that don't complete within a specified number of days after being initiated. When a multipart upload becomes eligible for a stop operation, Amazon S3 deletes any uploaded parts and stops the multipart upload.<br><br>For conceptual information, see the following topics in the *Amazon S3 User Guide*:<br><br>• Aborting a multipart upload<br>• Elements to describe lifecycle actions<br><br>The following API operations have been updated to support the new action:<br><br>• PUT Bucket lifecycle – The XML configuration now allows you to specify the `AbortIncompleteMultipartUpload` action in a lifecycle configuration rule.<br>• List Parts and Initiate Multipart Upload – Both of these API operations now return two additional response headers (`x-amz-abort-date` , and `x-amz-abort-rule-id` ) if the bucket has a lifecycle rule that specifies the `AbortIncompleteMultipartUpload` action. These headers in the response indicate when the initiated multipart upload becomes eligible for a stop operation and which lifecycle rule is applicable. | March 16, 2016 |

| Change | Description | Date |
| --- | --- | --- |
| Asia Pacific (Seoul) Region | Amazon S3 is now available in the Asia Pacific (Seoul) Region. For more information about Amazon S3 Regions and endpoints, see Regions and Endpoints in the *AWS General Reference*. | January 6, 2016 |
| New condition key and a multipart upload change | IAM policies now support an Amazon S3 `s3:x-amz-storage-class` condition key. For more information, see Bucket policy examples using condition keys.<br><br>You no longer need to be the initiator of a multipart upload to upload parts and complete the upload. For more information, see Multipart upload API and permissions. | December 14, 2015 |
| Renamed the US Standard Region | Changed the Region name string from "US Standard" to "US East (N. Virginia)." This is only a Region name update, there is no change in the functionality. | December 11, 2015 |
| New storage class | Amazon S3 now offers a new storage class, STANDARD_IA (IA, for infrequent access) for storing objects. This storage class is optimized for long-lived and less frequently accessed data. For more information, see Using Amazon S3 storage classes.<br><br>Lifecycle configuration feature updates now allow you to transition objects to the STANDARD_IA storage class. For more information, see Managing your storage lifecycle.<br><br>Previously, the Cross-Region Replication feature used the storage class of the source object for object replicas. Now, when you configure Cross-Region Replication, you can specify a storage class for the object replica created in the destination bucket. For more information, see Replicating objects overview. | September 16, 2015 |

| Change | Description | Date |
| --- | --- | --- |
| AWS CloudTrail integration | New AWS CloudTrail integration allows you to record Amazon S3 API activity in your S3 bucket. You can use CloudTrail to track S3 bucket creations or deletions, access control modifications, or lifecycle configuration changes. For more information, see Logging Amazon S3 API calls using AWS CloudTrail. | September 1, 2015 |
| Bucket limit increase | Amazon S3 now supports bucket limit increases. By default, customers can create up to 100 buckets in their AWS account. Customers who need additional buckets can increase that limit by submitting a service limit increase. For information about how to increase your bucket limit, go to AWS service quotas in the *AWS General Reference*. For more information, see Using the AWS SDKs and Bucket quotas, restrictions, and limitations. | August 4, 2015 |
| Consistency model update | Amazon S3 now supports read-after-write consistency for new objects added to Amazon S3 in the US East (N. Virginia) Region. Prior to this update, all Regions except US East (N. Virginia) Region supported read-after-write consistency for new objects uploaded to Amazon S3. With this enhancement, Amazon S3 now supports read-after-write consistency in all Regions for new objects added to Amazon S3. Read-after-write consistency allows you to retrieve objects immediately after creation in Amazon S3. For more information, see Regions. | August 4, 2015 |
| Event notifications | Amazon S3 Event Notifications have been updated to add notifications when objects are deleted and to add filtering on object names with prefix and suffix matching. For more information, see Amazon S3 Event Notifications. | July 28, 2015 |

| Change | Description | Date |
| --- | --- | --- |
| Amazon CloudWatch integration | New Amazon CloudWatch integration allows you to monitor and set alarms on your Amazon S3 usage through CloudWatch metrics for Amazon S3. Supported metrics include total bytes for Standard storage, total bytes for Reduced-Redundancy Storage, and total number of objects for a given S3 bucket. For more information, see Monitoring metrics with Amazon CloudWatch. | July 28, 2015 |
| Support for deleting and emptying non-empty buckets | Amazon S3 now supports deleting and emptying non-empty buckets. For more information, see Emptying a bucket. | July 16, 2015 |
| Bucket policies for Amazon VPC endpoints | Amazon S3 has added support for bucket policies for virtual private cloud (VPC) (VPC) endpoints. You can use S3 bucket policies to control access to buckets from specific VPC endpoints, or specific VPCs. VPC endpoints are easy to configure, are highly reliable, and provide a secure connection to Amazon S3 without requiring a gateway or a NAT instance. For more information, see Controlling access from VPC endpoints with bucket policies. | April 29, 2015 |
| Event notifications | Amazon S3 Event Notifications have been updated to support the switch to resource-based permissions for AWS Lambda functions. For more information, see Amazon S3 Event Notifications. | April 9, 2015 |
| Cross-Region Replication | Amazon S3 now supports Cross-Region Replication. Cross-Region Replication is the automatic, asynchronous copying of objects across buckets in different AWS Regions. For more information, see Replicating objects overview. | March 24, 2015 |

| Change | Description | Date |
| --- | --- | --- |
| Event notifications | Amazon S3 now supports new event types and destinations in a bucket notification configuration. Prior to this release, Amazon S3 supported only the *s3:ReducedRedundancyLostObject* event type and an Amazon SNS topic as the destination. For more information about the new event types, see Amazon S3 Event Notifications. | November 13, 2014 |
| Server-side encryption with customer-provided encryption keys | Server-side encryption with AWS Key Management Service (AWS KMS) keys (SSE-KMS)<br><br>Amazon S3 now supports server-side encryption using AWS KMS. This feature allows you to manage the envelope key through AWS KMS, and Amazon S3 calls AWS KMS to access the envelope key within the permissions you set.<br><br>For more information about server-side encryption with AWS KMS, see Protecting Data Using Server-Side Encryption with AWS Key Management Service. | November 12, 2014 |
| Europe (Frankfurt) Region | Amazon S3 is now available in the Europe (Frankfurt) Region. | October 23, 2014 |
| Server-side encryption with customer-provided encryption keys | Amazon S3 now supports server-side encryption using customer-provided encryption keys (SSE-C). Server-side encryption enables you to request Amazon S3 to encrypt your data at rest. When using SSE-C, Amazon S3 encrypts your objects with the custom encryption keys that you provide. Since Amazon S3 performs the encryption for you, you get the benefits of using your own encryption keys without the cost of writing or executing your own encryption code.<br><br>For more information about SSE-C, see Server-Side Encryption (Using Customer-Provided Encryption Keys). | June 12, 2014 |

| Change | Description | Date |
| --- | --- | --- |
| Lifecycle support for versioning | Prior to this release, lifecycle configuration was supported only on nonversioned buckets. Now you can configure lifecycle on both nonversioned and versioning-enabled buckets. For more information, see Managing your storage lifecycle. | May 20, 2014 |
| Access control topics revised | Revised Amazon S3 access control documentation. For more information, see Identity and Access Management for Amazon S3. | April 15, 2014 |
| Server access logging topic revised | Revised server access logging documentation. For more information, see Logging requests with server access logging. | November 26, 2013 |
| .NET SDK samples updated to version 2.0 | .NET SDK samples in this guide are now compliant to version 2.0. | November 26, 2013 |
| SOAP Support Over HTTP deprecated | SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use either the REST API or the AWS SDKs. | September 20, 2013 |
| IAM policy variable support | IAM policy language now supports variables. When a policy is evaluated, any policy variables are replaced with values that are supplied by context-based information from the authenticated user's session. You can use policy variables to define general purpose policies without explicitly listing all the components of the policy. For more information about policy variables, see IAM Policy Variables Overview in the *IAM User Guide*.<br><br>For examples of policy variables in Amazon S3, see Identity-based policy examples for Amazon S3. | April 3, 2013 |

| Change | Description | Date |
| --- | --- | --- |
| Console support for Requester Pays | You can now configure your bucket for Requester Pays by using the Amazon S3 console. For more information, see Using Requester Pays buckets for storage transfers and usage. | December 31, 2012 |
| Root domain support for website hosting | Amazon S3 now supports hosting static websites at the root domain. Visitors to your website can access your site from their browser without specifying **www** in the web address (for example, they can use **example.com** instead of **www.example.com**). Many customers already host static websites on Amazon S3 that are accessible from a **www** subdomain (for example, **www.example.com**). Previously, to support root domain access, you needed to run your own web server to proxy root domain requests from browsers to your website on Amazon S3. Running a web server to proxy requests introduces additional costs, operational burden, and another potential point of failure. Now, you can take advantage of the high availability and durability of Amazon S3 for both **www** and root domain addresses. For more information, see Hosting a static website using Amazon S3. | December 27, 2012 |
| Console revision | Amazon S3 console has been updated. The documentation topics that refer to the console have been revised accordingly. | December 14, 2012 |

| Change | Description | Date |
| --- | --- | --- |
| Support for Archiving Data to S3 Glacier | Amazon S3 now supports a storage option that enables you to utilize S3 Glacier's low-cost storage service for data archival. To archive objects, you define archival rules identifying objects and a time frame when you want Amazon S3 to archive these objects to S3 Glacier. You can easily set the rules on a bucket using the Amazon S3 console or programmatically using the Amazon S3 API or AWS SDKs.<br><br>For more information, see Managing your storage lifecycle. | November 13, 2012 |
| Support for Website Page Redirects | For a bucket that is configured as a website, Amazon S3 now supports redirecting a request for an object to another object in the same bucket or to an external URL. For more information, see (Optional) Configuring a webpage redirect.<br><br>For information about hosting websites, see Hosting a static website using Amazon S3. | October 4, 2012 |
| Support for Cross-Origin Resource Sharing (CORS) | Amazon S3 now supports Cross-Origin Resource Sharing (CORS). CORS defines a way in which client web applications that are loaded in one domain can interact with or access resources in a different domain. With CORS support in Amazon S3, you can build rich client-side web applications on top of Amazon S3 and selectively allow cross-domain access to your Amazon S3 resources. For more information, see Using cross-origin resource sharing (CORS). | August 31, 2012 |
| Support for Cost Allocation Tags | Amazon S3 now supports cost allocation tagging, which allows you to label S3 buckets so you can more easily track their cost against projects or other criteria. For more information about using tagging for buckets, see Using cost allocation S3 bucket tags. | August 21, 2012 |

| Change | Description | Date |
| --- | --- | --- |
| Support for MFA-protected API access in bucket policies | Amazon S3 now supports MFA-protected API access, a feature that can enforce AWS Multi-Factor Authentication for an extra level of security when accessing your Amazon S3 resources. It is a security feature that requires users to prove physical possession of an MFA device by providing a valid MFA code. For more information, go to AWS Multi-Factor Authentication. You can now require MFA authentication for any requests to access your Amazon S3 resources.<br><br>To enforce MFA authentication, Amazon S3 now supports the `aws:MultiFactorAuthAge` key in a bucket policy. For an example bucket policy, see Requiring MFA. | July 10, 2012 |
| Object Expiration support | You can use Object Expiration to schedule automatic removal of data after a configured time period. You set object expiration by adding lifecycle configuration to a bucket. | 27 December 2011 |
| New Region supported | Amazon S3 now supports the South America (São Paulo) Region. For more information, see Accessing and listing an Amazon S3 bucket. | December 14, 2011 |
| Multi-Object Delete | Amazon S3 now supports Multi-Object Delete API that enables you to delete multiple objects in a single request. With this feature, you can remove large numbers of objects from Amazon S3 more quickly than using multiple individual DELETE requests. For more information, see Deleting Amazon S3 objects. | December 7, 2011 |
| New Region supported | Amazon S3 now supports the US West (Oregon) Region. For more information, see Buckets and Regions. | November 8, 2011 |
| Documentation Update | Documentation bug fixes. | November 8, 2011 |

| Change | Description | Date |
| --- | --- | --- |
| Documentation Update | In addition to documentation bug fixes, this release includes the following enhancements:<br>• New server-side encryption sections using the AWS SDK for PHP and the AWS SDK for Ruby (see Specifying server-side encryption with Amazon S3 managed keys (SSE-S3)). | October 17, 2011 |
| Server-side encryption support | Amazon S3 now supports server-side encryption. It enables you to request Amazon S3 to encrypt your data at rest, that is, encrypt your object data when Amazon S3 writes your data to disks in its data centers. In addition to REST API updates, the AWS SDK for Java and .NET provide necessary functionality to request server-side encryption. You can also request server-side encryption when uploading objects using the AWS Management Console. To learn more about data encryption, go to Using Data Encryption. | October 4, 2011 |
| Documentation Update | In addition to documentation bug fixes, this release includes the following enhancements:<br>• Added Ruby and PHP samples to the Making requests section.<br>• Added sections describing how to generate and use presigned URLs. For more information, see Sharing objects with presigned URLs and Sharing objects with presigned URLs.<br>• Updated an existing section to introduce AWS Explorers for Eclipse and Visual Studio. For more information, see Developing with Amazon S3 using the AWS SDKs. | September 22, 2011 |

| Change | Description | Date |
| --- | --- | --- |
| Support for sending requests using temporary security credentials | In addition to using your AWS account and IAM user security credentials to send authenticated requests to Amazon S3, you can now send requests using temporary security credentials you obtain from AWS Identity and Access Management (IAM). You can use the AWS Security Token Service API or the AWS SDK wrapper libraries to request these temporary credentials from IAM. You can request these temporary security credentials for your own use or hand them out to federated users and applications. This feature enables you to manage your users outside AWS and provide them with temporary security credentials to access your AWS resources.<br><br>For more information, see Making requests.<br><br>For more information about IAM support for temporary security credentials, see Temporary Security Credentials in the *IAM User Guide*. | August 3, 2011 |
| Multipart Upload API extended to enable copying objects up to 5 TB | Prior to this release, Amazon S3 API supported copying objects of up to 5 GB in size. To enable copying objects larger than 5 GB, Amazon S3 now extends the multipart upload API with a new operation, `Upload Part (Copy)`. You can use this multipart upload operation to copy objects up to 5 TB in size. For more information, see Copying, moving, and renaming objects.<br><br>For conceptual information about multipart upload API, see Uploading and copying objects using multipart upload. | June 21, 2011 |
| SOAP API calls over HTTP disabled | To increase security, SOAP API calls over HTTP are disabled. Authenticated and anonymous SOAP requests must be sent to Amazon S3 using SSL. | June 6, 2011 |

| Change | Description | Date |
| --- | --- | --- |
| IAM enables cross-account delegation | Previously, to access an Amazon S3 resource, an IAM user needed permissions from both the parent AWS account and the Amazon S3 resource owner. With cross-account access, the IAM user now only needs permission from the owner account. That is, If a resource owner grants access to an AWS account, the AWS account can now grant its IAM users access to these resources.<br><br>For more information, see Creating a role to delegate permissions to an IAM user in the *IAM User Guide*.<br><br>For more information on specifying principals in a bucket policy, see Principals for bucket policies. | June 6, 2011 |
| New link | This service's endpoint information is now located in the *AWS General Reference*. For more information, go to Regions and Endpoints in the AWS General Reference. | March 1, 2011 |
| Support for hosting static websites in Amazon S3 | Amazon S3 introduces enhanced support for hosting static websites. This includes support for index documents and custom error documents. When using these features, requests to the root of your bucket or a subfolder (for example, `http://mywebsite.com/subfolder` ) returns your index document instead of the list of objects in your bucket. If an error is encountered, Amazon S3 returns your custom error message instead of an Amazon S3 error message. For more information, see Hosting a static website using Amazon S3. | June 6, 2011 |

| Change | Description | Date |
| --- | --- | --- |
| This service's endpoint information is now located in the *AWS General Reference*. For more information, go to Regions and Endpoints in the AWS General Reference. | March 1, 2011 | |
| Support for hosting static websites in Amazon S3 | Amazon S3 introduces enhanced support for hosting static websites. This includes support for index documents and custom error documents. When using these features, requests to the root of your bucket or a subfolder (for example, `http://mywebsite.com/subfolder`) returns your index document instead of the list of objects in your bucket. If an error is encountered, Amazon S3 returns your custom error message instead of an Amazon S3 error message. For more information, see Hosting a static website using Amazon S3. | February 17, 2011 |
| Response Header API Support | The GET Object REST API now allows you to change the response headers of the REST GET Object request for each request. That is, you can alter object metadata in the response, without altering the object itself. For more information, see Downloading objects. | January 14, 2011 |
| Large object support | Amazon S3 has increased the maximum size of an object you can store in an S3 bucket from 5 GB to 5 TB. If you are using the REST API, you can upload objects of up to 5 GB in a single PUT operation. For larger objects, you must use the Multipart Upload REST API to upload objects in parts. For more information, see Uploading and copying objects using multipart upload. | December 9, 2010 |

| Change | Description | Date |
| --- | --- | --- |
| Multipart upload | Multipart upload enables faster, more flexible uploads into Amazon S3. It allows you to upload a single object as a set of parts. For more information, see Uploading and copying objects using multipart upload. | November 10, 2010 |
| Canonical ID support in bucket policies | You can now specify canonical IDs in bucket policies. For more information, see Principals for bucket policies | September 17, 2010 |
| Amazon S3 works with IAM | This service now integrates with AWS Identity and Access Management (IAM). For more information, go to AWS services that work with IAM in the *IAM User Guide*. | September 2, 2010 |
| Notifications | The Amazon S3 notifications feature enables you to configure a bucket so that Amazon S3 publishes a message to an Amazon Simple Notification Service (Amazon SNS) topic when Amazon S3 detects a key event on a bucket. For more information, see Setting Up Notification of Bucket Events. | July 14, 2010 |
| Bucket policies | Bucket policies are an access management system that you use to set access permissions across buckets, objects, and sets of objects. This functionality supplements and in many cases replaces access control lists. For more information, see Bucket policies for Amazon S3. | July 6, 2010 |
| Path-style syntax available in all Regions | Amazon S3 now supports the path-style syntax for any bucket in the US Classic Region, or if the bucket is in the same Region as the endpoint of the request. For more information, see Virtual Hosting. | June 9, 2010 |
| New endpoint for Europe (Ireland) | Amazon S3 now provides an endpoint for Europe (Ireland) : `http://s3-eu-west-1.amazonaws.com` . | June 9, 2010 |

| Change | Description | Date |
| --- | --- | --- |
| Console | You can now use Amazon S3 through the AWS Management Console. You can read about all of the Amazon S3 functionality in the console in the Amazon Simple Storage Service User Guide. | June 9, 2010 |
| Reduced Redundancy | Amazon S3 now enables you to reduce your storage costs by storing objects in Amazon S3 with reduced redundancy. For more information, see Reduced Redundancy Storage. | May 12, 2010 |
| New Region supported | Amazon S3 now supports the Asia Pacific (Singapore) Region. For more information, see Buckets and Regions. | April 28, 2010 |
| Object Versioning | This release introduces object versioning. All objects now can have a key and a version. If you enable versioning for a bucket, Amazon S3 gives all objects added to a bucket a unique version ID. This feature enables you to recover from unintended overwrites and deletions. For more information, see Versioning and Using Versioning. | February 8, 2010 |
| New Region supported | Amazon S3 now supports the US West (N. California) Region. The new endpoint for requests to this Region is `s3-us-west-1.amazonaws.com` . For more information, see Buckets and Regions. | December 2, 2009 |
| AWS SDK for .NET | AWS now provides libraries, sample code, tutorials, and other resources for software developers who prefer to build applications using .NET language-specific API operations instead of REST or SOAP. These libraries provide basic functions (not included in the REST or SOAP APIs), such as request authentication, request retries, and error handling so that it's easier to get started. For more information about language-specific libraries and resources, see Developing with Amazon S3 using the AWS SDKs. | November 11, 2009 |

# AWS Glossary

For the latest AWS terminology, see the AWS glossary in the *AWS Glossary Reference*.
