# Particle aggregation and breakage using multiphaseEulerFoam

A CFD-PBM approach Kasper Bilde

#### Introduction

Kasper Bilde Industrial PhD Student Aalborg University, Denmark **Supervisors**: Kim Sørensen and Jakob Hærvig

**PhD Scope**: Aggregation and breakage of micronsized particles in turbulent flows for highly accelerated sedimentation onboard marine vessels

# Background

Marine scrubbers clean the exhaust gas from the engine for SOx and ~40% of the particulate mass.

The particulate matter needs to be removed before discharged into the Oceans.

### **Motivation**

High-speed separators are utilised for an accelerated sedimentation. The particle size is the most important parameter for sedimentation.

## **Motivation**

Micron-sized particles are agglomerated in a hydraulic flocculator before separation in the high-speed separator.

# Computational domain

Designing a compact hydraulic flocculator and achieving the largest possible particle size distribution.

Analyse the particle size distribution through a 90° pipe bend.

### **Numerical method**

Euler-Lagrangian

# **Governing equations**

Euler-Euler approach using the population balance equations to track the particle size distribution

Mass- and momentum equations

$$rac{\partial}{\partial t}\left( lpha_{arphi}
ho_{arphi}
ight) + 
abla\cdot\left( lpha_{arphi}
ho_{arphi}oldsymbol{u}_{arphi}
ight) = 0$$

$$\frac{\partial}{\partial t}\left(\alpha_{\varphi}\rho_{\varphi}\boldsymbol{u}_{\varphi}\right)+\nabla\cdot\left(\alpha_{\varphi}\rho_{\varphi}\boldsymbol{u}_{\varphi}\boldsymbol{u}_{\varphi}\right)-\nabla\tau_{\varphi}=-\alpha_{\varphi}\nabla p+\alpha_{\varphi}\rho_{\varphi}\boldsymbol{g}+\boldsymbol{M}_{\varphi}+\boldsymbol{S}_{\varphi}$$

where  $oldsymbol{M}_{arphi}$  is the momentum exchange at the interfaces and  $oldsymbol{S}_{arphi}$  is the source term.

### **Governing equations**

Momentum exchange at the interfaces is the sum of external force

Saffman-Mei lift force *published* to OpenFOAM v10

## **Population balance equation**

The population balance equation,

$$rac{\partial}{\partial t} n_v + 
abla \cdot (oldsymbol{u}_{\mathrm{p}} n_v) = S_v \, ,$$

tracks the number density function. The PBE is solved by the class method which was implemented into multiphaseEulerFoam by Lehnigk et al. (2021). Discontinuous changes due to aggregation and breakage are accounted for by the

source term,  $S_v.$ 

# Aggregation kernel

The aggregation kernel for solid particles by Adachi et al. (1994) is implemented into OpenFOAM v10.

$$a_{d,d'} = rac{4}{3} \sqrt{rac{3\pi}{10}} \sqrt{rac{arepsilon}{
u}} \left( d + d' 
ight)^3$$

where d and d' are the diameters of two colliding particles.

# Breakage kernel

The breakage kernel for solid particles by Kusters (1991) is implemented into OpenFOAM v10.

$$b_{v'} = \sqrt{rac{4}{15\pi}} \sqrt{rac{arepsilon}{
u}} \exp\left(-rac{arepsilon_{
m cr}}{arepsilon}
ight)$$

Herein the critical energy dissipation rate required to cause a break up is given by

$$arepsilon_{
m cr} = rac{B}{r_{
m c}}\,,$$

where B is the particle strength parameter and  $r_{\rm c}$  is the collision radius of a particle.

### **Simulation properties**

#### **Results**

#### Particle size distribution

# **Development work**

# **Closing remarks**

The CFD-PBE framework allows to directly analyse the particle size distribution within the domain.

It is visible how the particles aggregate in the straight turbulent pipe and break up when subject to the sharp curvature of the bend.

On-going work is made to determine the best suited design for marine installation for effective accelerated sedimentation.

#### **Source files**

The presented 90° pipe bend is published to OpenFOAM v10 of The OpenFOAM Foundation.

The tutorial is located under the multiphaseEulerFoam tutorials.

\$FOAM\_TUTORIALS/multiphase/multiphaseEulerFoam/RAS/pipeBend

The Saffman-Mei lift force model, the aggregation kernel and the breakage kernel are also published to OpenFOAM v10.

# Acknowledgements

A big thank you to Dr. Ronald Lehnigk and Dr. Fabian Schlegel from Helmholtz-Zentrum Dresden Rossendorf as well as Anders Schou Simonsen from Alfa Laval for their assistance in the development of this work.

# Thank you for your attention.

If you have any question, feel free to ask or reach out.
