The Problem in Quantum Computing

Pure quantum circuits are easy...

Linear operator composed & tensored from given *quantum logic gates*

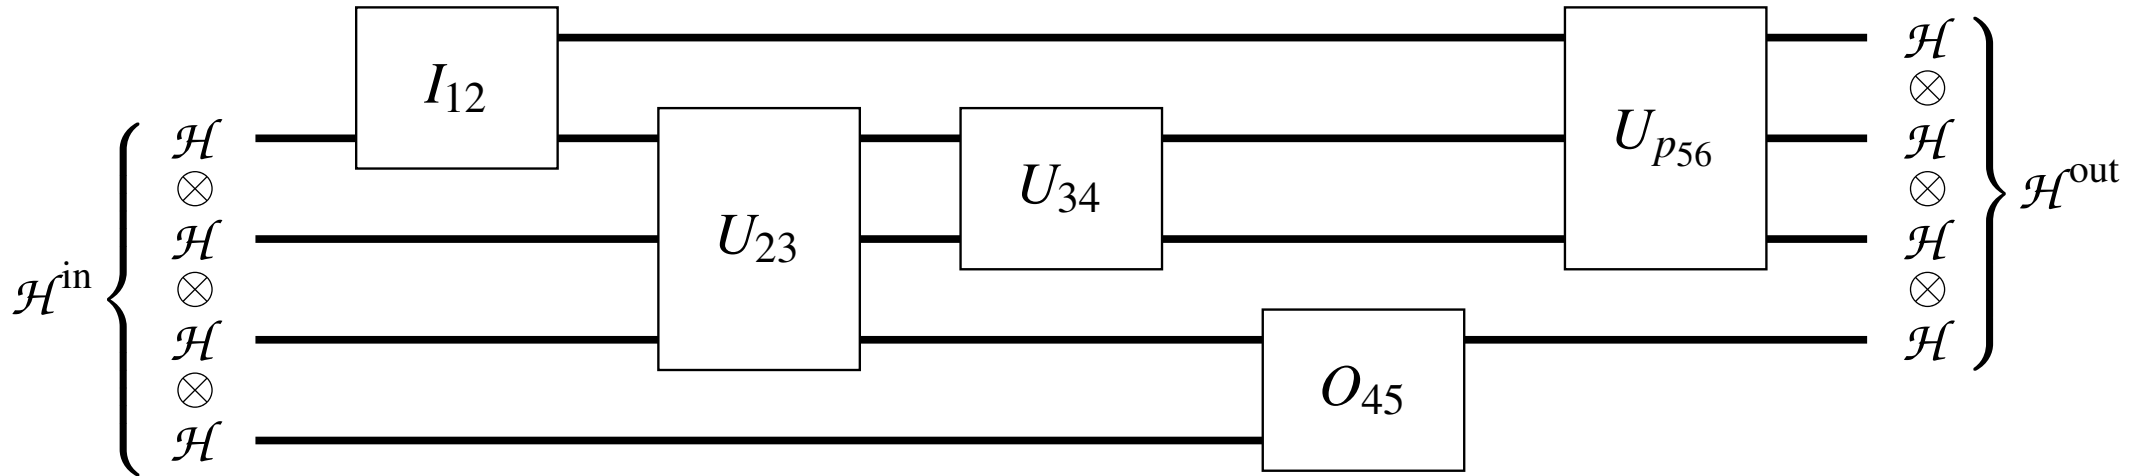

Hilbert space of possible **input** quantum states

linear transformation
upon execution

Hilbert space of possible **output** quantum states

Pure quantum circuits are easy...

Linear operator composed & tensored from given *quantum logic gates*

Hilbert space of possible **input** quantum states

linear transformation upon execution

Hilbert space of possible **output** quantum states

but real quantum circuits have **classical control & effects**

(Example: QBit Teleportation protocol)

full reality is a loop: Classical $\begin{matrix} \leftarrow \text{measure} \\ \rightarrow \text{prepare} \end{matrix}$ Quantum

full reality is a loop: Classical $\begin{matrix} \leftarrow \text{measure} \\ \rightarrow \text{prepare} \end{matrix}$ Quantum

full reality is a loop: Classical $\begin{matrix} \leftarrow \text{measure} \\ \rightarrow \text{prepare} \end{matrix}$ Quantum

full loop needed e.g. for quantum error correction but its formal language theory had remained thin

full reality is a loop: Classical $\xleftarrow{\text{measure}}$ Quantum $\xrightarrow{\text{prepare}}$ Classical

full loop needed e.g. for quantum error correction but its formal language theory had remained thin

existing models for dynamic lifting are ad hoc & unverified

Existing quantum typed circuit languages

are embedded inside *classical* type theories:

for universal classical computation

unverified linear type universe

Quantum Circuit Language

e.g. QML, Quipper, QWIRE, ...

Existing quantum typed circuit languages

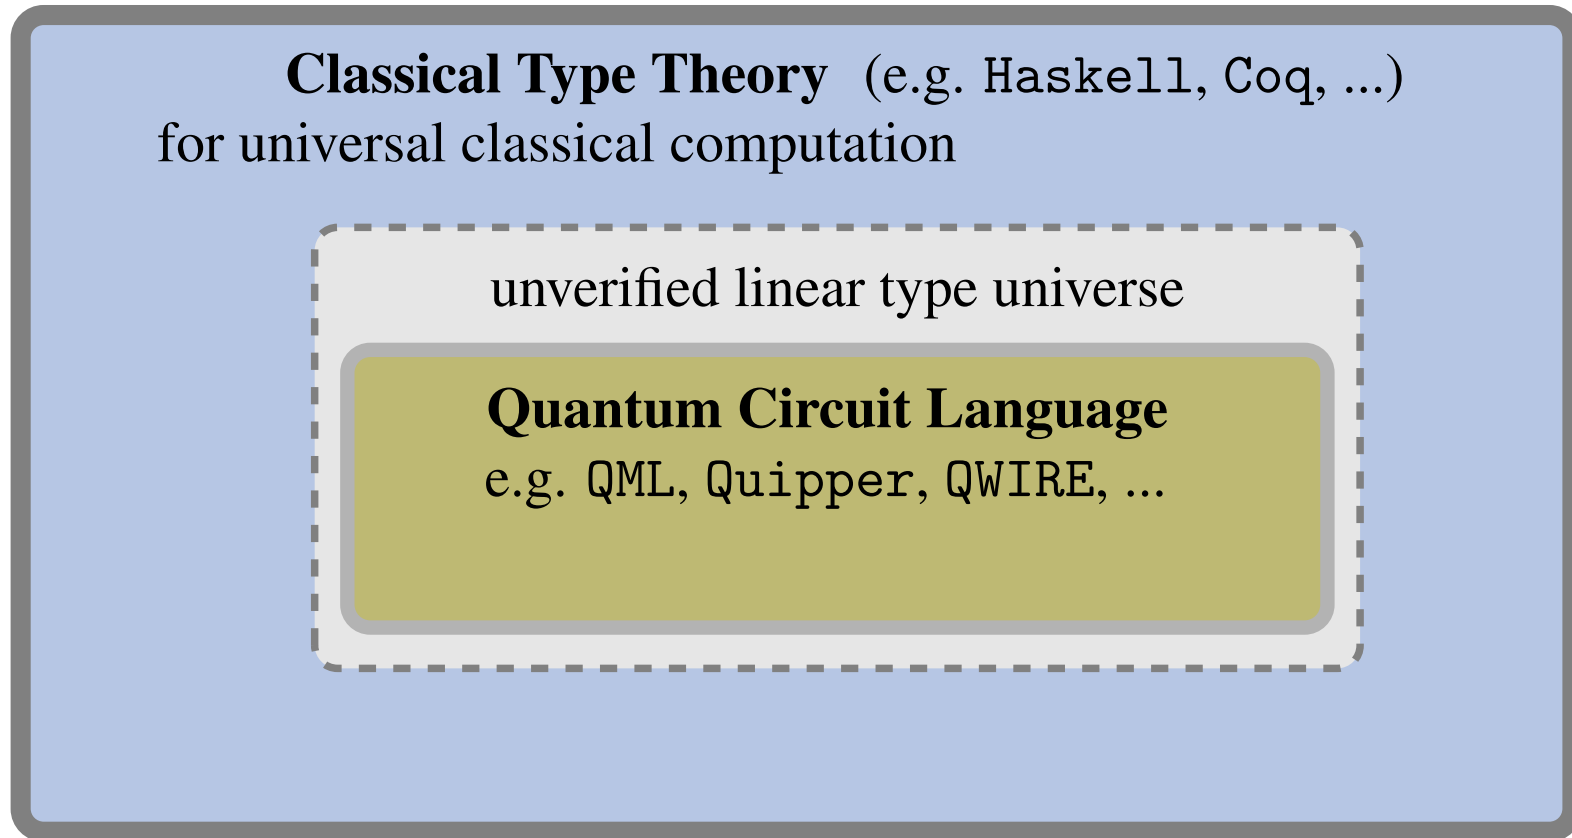

are embedded inside *classical* type theories:

for lack of a universal linear type theory.

Existing quantum typed circuit languages

are embedded inside *classical* type theories:

for lack of a universal linear type theory.

Why did that not exist?

The Problem in Type Theory

Historical search for quantum/linear logic/type-theory — a goose chase:

Historical search for quantum/linear logic/type-theory — a goose chase:

Birkhoff-von Neumann 1936 (BvN) give physically well-motivated *quantum logic*,
but seemingly formally unsatisfactory (infamous lack of *implication*-connective, etc.)

THE LOGIC OF QUANTUM MECHANICS

BY GARRETT BIRKHOFF AND JOHN VON NEUMANN

(Received April 4, 1936)

1. Introduction. One of the aspects of quantum theory which has attracted the most general attention, is the novelty of the logical notions which it presupposes. It asserts that even a complete mathematical description of a physical system \mathcal{S} does not in general enable one to predict with certainty the result of an experiment on \mathcal{S} , and that in particular one can never predict with certainty both the position and the momentum of \mathcal{S} (Heisenberg's Uncertainty Principle). It further asserts that most pairs of observations are incompatible, and cannot be made on \mathcal{S} simultaneously (Principle of Non-commutativity of Observations).

The object of the present paper is to discover what logical structure one may hope to find in physical theories which, like quantum mechanics, do not conform to classical logic. Our main conclusion, based on admittedly heuristic arguments, is that one can reasonably expect to find a calculus of propositions which is formally indistinguishable from the calculus of linear subspaces with respect to *set products*, *linear sums*, and *orthogonal complements*—and resembles the usual calculus of propositions with respect to *and*, *or*, and *not*.

LINEAR LOGIC*

Jean-Yves GIRARD

Équipe de Logique Mathématique, UA 753 du CNRS, UER de Mathématiques, Université de Paris VII, 75251 Paris, France

Communicated by M. Nivat
Received October 1986

A la mémoire de Jean van Heijenoort

Abstract. The familiar connective of negation is broken into two operations: linear negation which is the purely negative part of negation and the modality “of course” which has the meaning of a reaffirmation. Following this basic discovery, a completely new approach to the whole area between constructive logics and programming is initiated.

Historical search for quantum/linear logic/type-theory — a goose chase:

Internal logic in $\text{FDVect}_{/\mathcal{H}}$		
proposition	conjunction	disjunction
$\begin{array}{c} \mathcal{P} \\ \uparrow \\ p \\ \downarrow \\ \mathcal{H} \end{array}$	$\begin{array}{ccccc} & & \mathcal{P}_1 \cap \mathcal{P}_2 & & \\ & \longleftarrow & & \longrightarrow & \\ \mathcal{P}_1 & & & & \mathcal{P}_2 \\ & \searrow & \uparrow & \swarrow & \\ & p_1 & p_1 \wedge p_2 & p_2 & \\ & & \downarrow & & \\ & & \mathcal{H} & & \end{array}$	$\begin{array}{ccccc} & & \mathcal{P}_1 \oplus \mathcal{P}_2 & & \\ & \nearrow & \downarrow & \nwarrow & \\ \mathcal{P}_1 & & \text{Span}(\mathcal{P}_1, \mathcal{P}_2) & & \mathcal{P}_2 \\ & \searrow & \uparrow & \swarrow & \\ & p_1 & p_1 \vee p_2 & p_2 & \\ & & \downarrow & & \\ & & \mathcal{H} & & \end{array}$

Also, we need classically-dependent linear types, eg. $n : \mathbb{N} \vdash \mathbb{C}^n : \text{LinType}$ – these ought to be interpreted as vector (Hilbert) *bundles*.

Fu, Kishida & Selinger (2020) present a *classically*-dependent linear type theory explicitly as a practical quantum programming language (proto-Quipper) with categorical semantics in (notably) vector bundles over sets: Vect_{Set} .

NB: A *linear*-dependent internal logic of Vect_{Set} would *still* see BvN quantum logic.

Ironically, *enhancing* the internal linear logic of FDVect with type dependency, (to see the slices $\text{FDVect}_{/\mathcal{H}}$) would immediately recover BvN’s quantum logic:

Internal logic in $\text{FDVect}_{/\mathcal{H}}$		
proposition	conjunction	disjunction
$\begin{array}{c} \mathcal{P} \\ \uparrow \\ p \\ \downarrow \\ \mathcal{H} \end{array}$	$\begin{array}{ccccc} & & \mathcal{P}_1 \cap \mathcal{P}_2 & & \\ & \longleftarrow & & \longrightarrow & \\ \mathcal{P}_1 & & & & \mathcal{P}_2 \\ & \swarrow & \uparrow & \searrow & \\ & p_1 & p_1 \wedge p_2 & p_2 & \\ & \searrow & \downarrow & \swarrow & \\ & & \mathcal{H} & & \end{array}$	$\begin{array}{ccccc} & & \mathcal{P}_1 \oplus \mathcal{P}_2 & & \\ & \nearrow & \downarrow & \nwarrow & \\ \mathcal{P}_1 & & \text{Span}(\mathcal{P}_1, \mathcal{P}_2) & & \mathcal{P}_2 \\ & \swarrow & \uparrow & \searrow & \\ & p_1 & p_1 \vee p_2 & p_2 & \\ & \searrow & \downarrow & \swarrow & \\ & & \mathcal{H} & & \end{array}$

Also, we need classically-dependent linear types, eg. $n : \mathbb{N} \vdash \mathbb{C}^n : \text{LinType}$ – these ought to be interpreted as vector (Hilbert) *bundles*.

Fu, Kishida & Selinger (2020) present a *classically*-dependent linear type theory explicitly as a practical quantum programming language (proto-Quipper) with categorical semantics in (notably) vector bundles over sets: Vect_{Set} .

NB: A *linear*-dependent internal logic of Vect_{Set} would *still* see BvN quantum logic.

NB: Vect_{Set} carries *two* monoidal structures: cartesian (\times) and “external” (\otimes) tensor.

(to see the slices $\text{FDVect}_{/\mathcal{H}}$) would immediately recover BvN's quantum logic:

Internal logic in $\text{FDVect}_{/\mathcal{H}}$		
proposition	conjunction	disjunction
\mathcal{P} \uparrow p \downarrow \mathcal{H}	$\mathcal{P}_1 \longleftarrow \mathcal{P}_1 \cap \mathcal{P}_2 \longrightarrow \mathcal{P}_2$ $\swarrow \quad \uparrow \quad \searrow$ $p_1 \quad p_1 \wedge p_2 \quad p_2$ $\searrow \quad \downarrow \quad \swarrow$ \mathcal{H}	$\mathcal{P}_1 \oplus \mathcal{P}_2$ $\swarrow \quad \downarrow \quad \nwarrow$ $\text{Span}(\mathcal{P}_1, \mathcal{P}_2)$ $\swarrow \quad \uparrow \quad \nwarrow$ $p_1 \quad p_1 \vee p_2 \quad p_2$ $\searrow \quad \downarrow \quad \swarrow$ \mathcal{H}

Also, we need classically-dependent linear types, eg. $n : \mathbb{N} \vdash \mathbb{C}^n : \text{LinType}$ – these ought to be interpreted as vector (Hilbert) *bundles*.

Fu, Kishida & Selinger (2020) present a *classically*-dependent linear type theory explicitly as a practical quantum programming language (proto-Quipper) with categorical semantics in (notably) vector bundles over sets: Vect_{Set} .

NB: A *linear*-dependent internal logic of Vect_{Set} would *still* see BvN quantum logic.

NB: Vect_{Set} carries *two* monoidal structures: cartesian (\times) and “external” (\otimes) tensor.

Hence full dependency requires handling nested contexts like $X \times (\mathcal{H} \otimes \mathcal{V}) \times \mathcal{W}$.

Internal logic in $\text{FDVect}/\mathcal{H}$		
proposition	conjunction	disjunction
$\begin{array}{c} \mathcal{P} \\ \uparrow \\ p \\ \downarrow \\ \mathcal{H} \end{array}$		

Also, we need classically-dependent linear types, eg. $n : \mathbb{N} \vdash \mathbb{C}^n : \text{LinType}$ – these ought to be interpreted as vector (Hilbert) *bundles*.

Fu, Kishida & Selinger (2020) present a *classically*-dependent linear type theory explicitly as a practical quantum programming language (proto-Quipper) with categorical semantics in (notably) vector bundles over sets: Vect_{Set} .

A Dependent Type Theory with Names and Binding

[Ulrich Schöpp](#) & [Ian Stark](#)

Schöpp & Stark (2004) make progress towards bunched dependent type theory
but do not resolve these problems.

Also, we need classically-dependent linear types, eg. $n : \mathbb{N} \vdash \mathbb{C}^n : \text{LinType}$ – these ought to be interpreted as vector (Hilbert) *bundles*.

Fu, Kishida & Selinger (2020) present a *classically*-dependent linear type theory explicitly as a practical quantum programming language (proto-Quipper) with categorical semantics in (notably) vector bundles over sets: Vect_{Set} .

NB: A *linear*-dependent internal logic of Vect_{Set} would *still* see BvN quantum logic.

NB: Vect_{Set} carries *two* monoidal structures: cartesian (\times) and “external” (\otimes) tensor.

Hence full dependency requires handling nested contexts like $X \times (\mathcal{H} \otimes \mathcal{V}) \times \mathcal{W}$.

O’Hearn & Pym (1999) already experimented with such “bunched” contexts, but ran into technical problems, eg. unsound identification of classical and linear unit.

Schöpp & Stark (2004) make progress towards bunched dependent type theory but do not resolve these problems.

Also, we need classically-dependent linear types, eg. $n : \mathbb{N} \vdash \mathbb{C}^n : \text{LinType}$ – these ought to be interpreted as vector (Hilbert) *bundles*.

Fu, Kishida & Selinger (2020) present a *classically*-dependent linear type theory explicitly as a practical quantum programming language (proto-Quipper) with categorical semantics in (notably) vector bundles over sets: Vect_{Set} .

NB: A *linear*-dependent internal logic of Vect_{Set} would *still* see BvN quantum logic.

NB: Vect_{Set} carries *two* monoidal structures: cartesian (\times) and “external” (\otimes) tensor.

Hence full dependency requires handling nested contexts like $X \times (\mathcal{H} \otimes \mathcal{V}) \times \mathcal{W}$.

O’Hearn & Pym (1999) already experimented with such “bunched” contexts, but ran into technical problems, eg. unsound identification of classical and linear unit.

Schöpp & Stark (2004) make progress towards bunched dependent type theory but do not resolve these problems.

The key hint for how to progress came from developments in higher topos theory:

Also, we need classically-dependent linear types, eg. $n : \mathbb{N} \vdash \mathbb{C}^n : \text{LinType}$ – these ought to be interpreted as vector (Hilbert) *bundles*.

Fu, Kishida & Selinger (2020) present a *classically*-dependent linear type theory explicitly as a practical quantum programming language (proto-Quipper) with categorical semantics in (notably) vector bundles over sets: Vect_{Set} .

NB: A *linear*-dependent internal logic of Vect_{Set} would *still* see BvN quantum logic.

The key hint for how to progress came from developments in higher topos theory:

Joyal (2008), Hoyois (2016) show unification of classical and linear *homotopy*-types: remarkably: ∞ -categories of *bundles* of linear homotopy types are again ∞ -toposes!

S. (2013), §4.1.2; S. (May 2014) points out that bundles of *spectra* should interpret a modal, namely *infinitesimally cohesive* Homotopy Type Theory (HoTT), and

S. (Feb 2014) suggests that classical HoTT should have a linear extension with multiplicative conjunction \otimes interpreted as the (external) smash product of spectra.

Demonstrates potential relevance as a quantum language – but gives no formal syntax.

Riley, Fister & Licata (2021) propose a syntax for such infinitesimally cohesive HoTT.

Hence full dependency requires handling nested contexts like $X \times (\mathcal{H} \otimes \mathcal{V}) \times \mathcal{W}$.

O’Hearn & Pym (1999) already experimented with such “bunched” contexts, but ran into technical problems, eg. unsound identification of classical and linear unit.

Schöpp & Stark (2004) make progress towards bunched dependent type theory but do not resolve these problems.

The key hint for how to progress came from developments in higher topos theory:

classically controlled gate

quantumly controlled gate

$$\mathcal{B}_\bullet \boxtimes \mathcal{K} \xrightarrow{G_\bullet} \mathcal{B}_\bullet \boxtimes \mathcal{K}$$

$$b : B \vdash \mathcal{K} \xrightarrow{G_b} \mathcal{K}$$

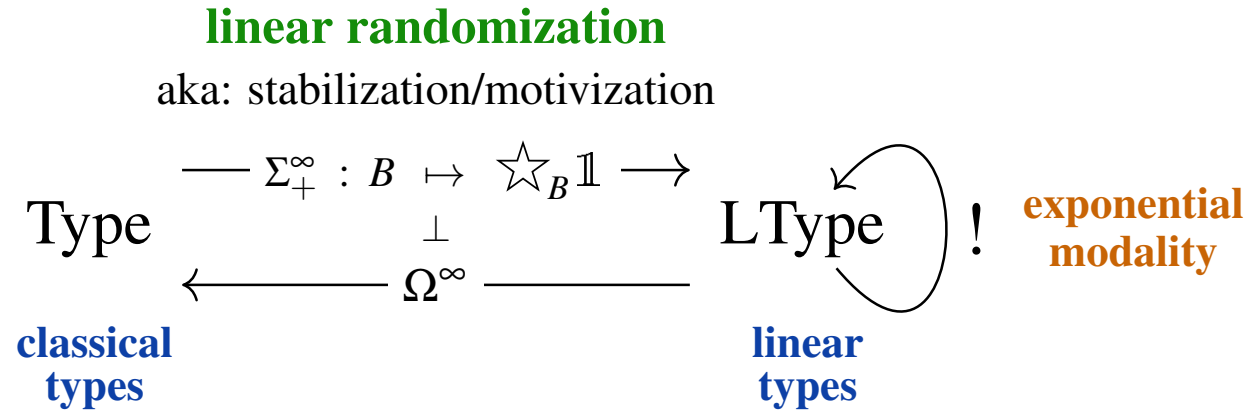

$$\square_B \mathcal{B}_\bullet \boxtimes \mathcal{K} \xrightarrow{\square_B G_\bullet} \square_B \mathcal{B}_\bullet \boxtimes \mathcal{K}$$

$$b : B \vdash \bigoplus_{b' : B} \mathcal{K} \xrightarrow{\bigoplus_{b' : B} G_{b'}} \bigoplus_{b' : B} \mathcal{K}$$

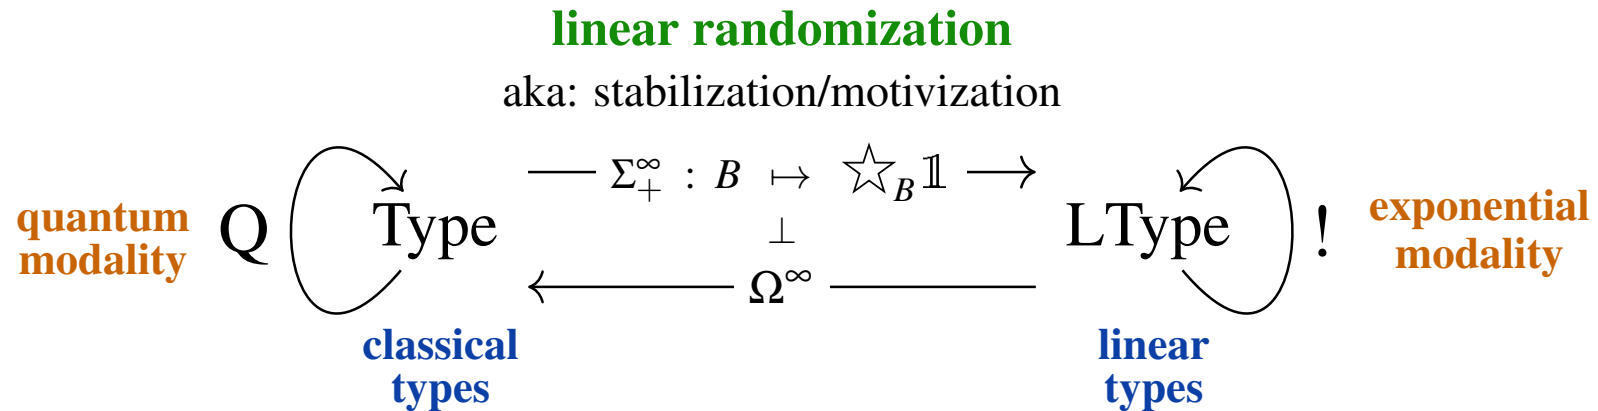

The Quantum modality.

Also the *exponential modality* traditionally postulated in linear logic is an emergent effect in LHoTT,

The Quantum modality.

Also the *exponential modality* traditionally postulated in linear logic is an emergent effect in LHoTT,
as is the crucial *Quantum Modality*, not considered before:

The Quantum modality.

Also the *exponential modality* traditionally postulated in linear logic is an emergent effect in LHoTT, as is the crucial *Quantum Modality*, not considered before:

The Q-monad plays a crucial role in the full formulation of the QS-language. It is the secret actor behind $\text{QBit} = \text{Q}(\text{Bit})\dots$

The Quantum modality.

Also the *exponential modality* traditionally postulated in linear logic is an emergent effect in LHoTT, as is the crucial *Quantum Modality*, not considered before:

The Q-monad plays a crucial role in the full formulation of the QS-language. It is the secret actor behind $\text{QBit} = \text{Q}(\text{Bit})\dots$

Quantum Circuits

Quantum effects are compatible with tensor product.

Linear Randomness and Indefiniteness are “very strong” effects, in that:

$$\circlearrowleft_B(D \otimes D') \simeq (\circlearrowleft_B D) \otimes D', \quad \star_B(D \otimes D') \simeq (\star_B D) \otimes D'$$

There is a whole system of them:

$$\circlearrowleft_B \circlearrowleft_{B'} \simeq \circlearrowleft_{B \times B'}, \quad \text{NB: } \circlearrowleft_B \circlearrowleft'_B \simeq \circlearrowleft_B \mathbb{1} \otimes \circlearrowleft'_B$$

which under dynamic lifting (monadicity comparison functor) gives the external tensor product of dependent linear types:

Quantum circuits with classical control & effects

are the *effectful* string diagrams in the linear type system

E.g.

The dependent linear type of a measurement on a pair of qbits:

$$\begin{array}{ccc}
 \text{type of a pair of coherent qbits} & \text{pair of measurements} & \text{type of collapsed qbits dependent on measured bits } b, b' \\
 \square_{\text{Bit}^2}(\text{QBit}_\bullet \boxtimes \text{QBit}_\bullet) & \xrightarrow{\varepsilon_{\text{Bit}^2}(\text{QBit}_\bullet \boxtimes \text{QBit}_\bullet)} & \text{QBit}_\bullet \boxtimes \text{QBit}_\bullet
 \end{array}$$

measured bits

$$(b, b') : \text{Bit}^2 \vdash \square_{\text{Bit}^2}(\text{QBit}_\bullet \boxtimes \text{QBit}_\bullet)_{(b, b')} \simeq \mathbb{C}^2 \otimes \mathbb{C}^2 \xrightarrow{\sum_{d, d'} q_{dd'} |d\rangle \otimes |d'\rangle \mapsto q_{bb'} |b\rangle \otimes |b'\rangle} \mathbb{C}.$$

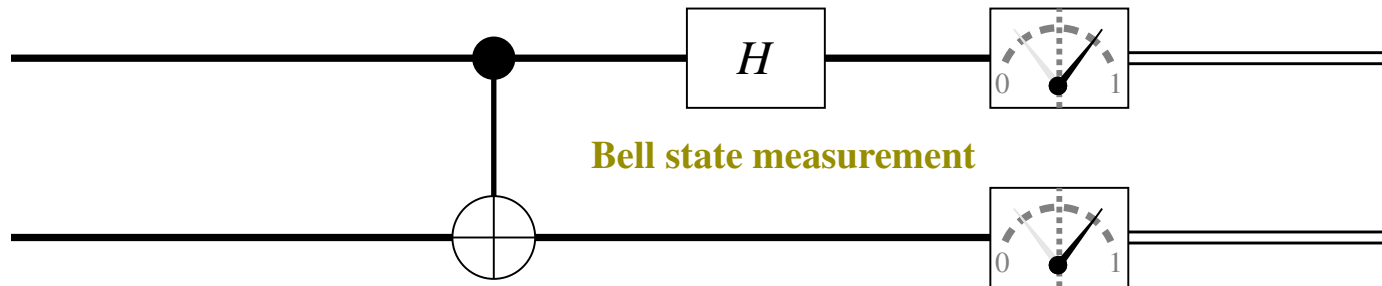

collapse of the quantum state

Example: Bell states of q-bits are typed as follows (regarded in $LType_{\text{Bit} \times \text{Bit}}$):

$$\text{QBit}_{\bullet} \boxtimes \text{QBit}_{\bullet} \rightarrow (\diamond_{\text{Bit}} \text{QBit}_{\bullet}) \boxtimes (\diamond_{\text{Bit}} \text{QBit}_{\bullet}) \simeq \square_{\text{Bit}^2} (\text{QBit}_{\bullet} \boxtimes \text{QBit}_{\bullet}) \rightarrow \square_{\text{Bit}^2} (\text{QBit}_{\bullet} \boxtimes \text{QBit}_{\bullet})$$

$$b, b' : \text{Bit} \vdash \mathbb{C} \xrightarrow{1 \mapsto |0\rangle \otimes |0\rangle} \xrightarrow{\frac{1}{\sqrt{2}} (|0\rangle + |1\rangle) \otimes |0\rangle} \xrightarrow{\frac{1}{\sqrt{2}} (|0\rangle \otimes |0\rangle + |1\rangle \otimes |1\rangle)} \mathbb{C}^2 \otimes \mathbb{C}^2$$

$$\square_{\text{Bit}^2} (\text{QBit}_{\bullet} \boxtimes \text{QBit}_{\bullet}) \longrightarrow \text{QBit}_{\bullet} \boxtimes \text{QBit}_{\bullet}$$

$$b_1, b_2 : \text{Bit} \vdash \mathbb{C}^2 \otimes \mathbb{C}^2 \xrightarrow{\sum_{b'_1, b'_2} q_{b'_1, b'_2} \cdot |b'_1\rangle \otimes |b'_2\rangle} \xrightarrow{(q_{0, b_2} + (-1)^{b_1} \cdot q_{1, (1-b_2)}) \cdot |b_1\rangle \otimes |b_2\rangle} \mathbb{C}$$

QS – Quantum Systems language @ CQTS

↪ full-blown Quantum Systems language emerges embedded in LHoTT

Linear Homotopy Type Theory (LHoTT)
for universal algorithmic quantum computation

Homotopy Type Theory (HoTT)
for topological logic gates

Quantum Systems Language (QS)
for quantum logic circuits

Topological Quantum Gate Circuits
for realistic quantum computation

*discussed
elsewhere*

*discussed in
this talk*

Effective Quantum Certification via Linear Homotopy Types

Urs Schreiber (NYU Abu Dhabi)
on joint work at CQTS with
D. J. Myers, M. Riley,
and Hisham Sati
