Dear Sir:

I have recently gotten a copy of your book, "A HANDBOOK OF INTEGER SEQUENCES." Sequence #608, i.e., "Denomination of Generalized Bernoulli Numbers" seems to be identical to the sequence of denominators of the formulae for the sums of powers of consecutive numbers to N.

If the sequences are indeed identical, perhaps it might be so stated in an ensuing supplement. If not, perhaps the sequence of denominators of the formulae for power sums might be added.

Please list me to receive any supplements which may be issued.

Sincerely,

C.H. Karlson

October 1, 1974

Mr. C. H. Karlson
545 West 126th Street
New York, New York 10027

Dear Mr. Karlson:

Thank you very much for your interesting letter.
The two sequences are not the same:

		1	2	3	4	5	6	7	8	9	10	<i>N608=2790</i> 608
$a_n =$	seq. 608	2	6	4	30	12	84	24	90	20	132	
b_n		2	6	4	30	12	42	24	?	?	?	

The definition of a_n is (from Milne-Thompson)

$$\frac{t}{(1+t) \log (1+t)} = \sum_{n=1}^{\infty} \frac{t^n}{n!} a_n. \quad (1)$$

Whereas b_q is the denominator of the right-hand side of

$$\sum_{n=1}^{n-1} n^q = \frac{11}{q+1} \sum_{k=0}^q \binom{q+1}{k} B_k N^{q-k+1}, \quad (2)$$

considered as a polynomial in N , where B_k are the usual Bernoulli numbers given by

$$\frac{t}{e^t - 1} = \sum_{r=0}^{\infty} \frac{t^r}{r!} B_r. \quad (3)$$

so there is really no reason why they should be the same.

Karlson - 2

I would like to include $\{b_n\}$ in later supplements.
Can you supply any more values?

Supplement I is enclosed.

Thank you again for your letter.

Yours sincerely,

MH-1216-NJAS-mv

October 14, 1974

Dear Mr. Sloane:

Your letter dated October 1st was very welcome. Thank you for the supplement. It is an expensive issue obviously and I think I should be billed for it.

$S_n x = 1^x + 2^x + \dots + n^x$

For typing purposes $S_n x$ will mean the sum 1 & 2 & n each to exponent x.

It is curious to me that $S_n 4$ and $S_n 5$ can be derived from lesser S_n but higher S_n cannot i.e. $S_n x = S_n 2 + 12a = (S_n 2)(S_n 1) + 2a$ and $S_n 5 = S_n 3 + 12b = (S_n 3)(S_n 1) + 3b$.

At least I have been unable to find similar equalities for higher S_n .

It seems to me that the denominators of $S_n x$ are always equal to twice the coefficient of $n x$. If this is so, and if you wish I will write the necessary simultaneities for solution of $S_n 8, 9$ and 10. But I do not have access to a computer nor the ability to program one.

Thank you again for your supplement

Very Sincerely,

Carl Harless

$$S_n x = \sum_{i=1}^n i^x$$

①

$$S_n 4 = \sum_1^{N-1} n^4$$

$$= \frac{1}{5} \left[1 \cdot N^5 - \frac{5}{2} N^4 + \frac{10}{6} N^3 - \frac{5}{30} N \right]$$

$$= \frac{1}{5} \left(N^5 - \frac{5}{2} N^4 + \frac{5}{3} N^3 - \frac{1}{6} N \right)$$

$$\begin{array}{r} 32 \\ 13 \\ \hline 45 \\ 40 \end{array}$$

N=2: ① = ans

$$\frac{1}{5} \left(32 - 5 \cdot 8 + \frac{5 \cdot 8}{3} - \frac{1}{3} \right) = 1$$

N=3: ①

$$\frac{1}{5} \left(243 - \frac{5 \cdot 81}{2} + 45 - \frac{1}{2} \right)$$

$$\frac{405}{2} - 203$$

$$\begin{array}{r} 243 \\ 45 \\ \hline 288 \\ 203 \\ \hline 585 \\ 17 \end{array}$$

$S_n 4 \Big|_1^{N-1} = \frac{N}{30} (N^4 - 15N^3 + 10N^2 - 1)$ — ①

$S_n 2 = \frac{(N-1)(N)(2N-1)}{6} \cdot \frac{(N-1)N}{2}$

$$\frac{N}{30} \cdot \frac{5(N-1)(2N-1)}{10N^2 - 15N + 5}$$

$$\frac{N}{30} (N^4 - 15N^3 + 15N - 6)$$

$N^2 (N^2 - 2N + 1)(2N - 1)$

$$\begin{array}{r} 1 \quad -2 \quad 1 \\ \hline -1 \quad 2 \quad -1 \\ 2 \quad -4 \quad 2 \\ \hline 2 \quad -5 \quad 4 \quad -1 \end{array}$$

November 6, 1974

Mr. C. H. Karlson
545 West 126th Street
New York, New York 10027

Dear Mr. Karlson:

Thanks for your letter of October 14. But I don't understand what you mean by

$$\begin{aligned} \text{Sn4} &= \text{Sn2} + 12a \\ &= (\text{Sn2})(\text{Sn1}) + 2a \end{aligned}$$

Please explain!

Regards,

MH-1216-NJAS-mv

Dear Mr. Sloane:

- $SN4 = SN2 + 12a = (SN2)(SN1) + 2a$
- $(2n^3 + 3n^2 + n)/6 + 12a = (2n^3 + 3n^2 + n)/6 + (n^2 + n)/2 + 2a$
whence
 - $(2n^5 + 5n^4 - 5n^2 - 2n)/10 = 12a$
substituting for 12a in 1 we get
 $(6n^5 + 15n^4 + 10n^3 - n)/30 = Sn4$

The values of a for n=1,2,3,----- are 0, 1, 7, 27, 77, 182, etc.
Similarly for $Sn5 = Sn3 + 12b = (Sn3)(Sn1) + 3b$

ASS 85 ✓

It might be noted that Sierpinski gives a second definition of seq. 100
seq.100 "Partitions into distinct parts". Sierpinski gives that and also "the number of decompositions of n into a sum of non decreasing odd numbers". ref.s11 pp400-401.
An interesting sequence is related to an inequality often found in tests.
 $(x)^{-n} + (x+1)^{-n} \neq (x+2)^{-n}$ for n greater than 2.

It gives highest and lowest values related to the balance of the inequality. But it does not meet the requirement that it be found in the literature (as far as I know).

2, 47, 64, 657, 2002, 12219, 89264, 28357, etc.

Cordially yours,

omit

Dear Mr. Karlson:

Thanks for your letter of November 13. The last Sequence you mention is new to me, although I don't really understand how it is defined, or calculated. For the past year or so a colleague (Mrs. MacWilliams) and I have been writing a book on error-correcting codes. A copy of Chapter 1 is enclosed in case you are interested. Any criticisms would be appreciated.

Best regards,

MH-1216-NJAS-mv
