(54) Title: FAT FREE CORN CHIPS		
(57) Abstract <p>The present invention relates to fat free corn chips comprising: corn flour or masa and fat free filler selected from the group consisting of starch, protein and nondigestible fiber, and mixtures thereof; nondigestible fat substitute; and other essentially fat free ingredients selected from the group consisting of salt, emulsifiers and fat free seasonings and combinations thereof. The corn chips comprise up to about 50 % corn and fat free filler; from about 1 % to about 35 % of nondigestible fat substitute; from 0 % to about 4 % moisture; and from 0 % to about 10 % of other essentially fat free ingredients and less than 0.5 gm digestible fat per 30 gm serving. Any residual or intrinsic digestible fat in the 30 gram serving is negligible.</p>		

FAT FREE CORN CHIPS

TECHNICAL FIELD

The present invention relates to corn chips and similar corn snack food products.

BACKGROUND OF THE INVENTION

Salted snacks such as fabricated corn chips are popular consumer snack products. Many people who enjoy eating corn chips also want to or need to reduce the level of digestible fat in their diets. Corn masa and corn meal contain corn oil. Corn masa-based products are made by forming corn masa dough into the desired shape, e.g. chips, and cooking the shaped masa. These fabricated corn products are preferably cooked by immersing them in a frying fat medium that has been heated to temperatures of approximately 300°F to 450°F (148.9°C to 232°C). The fabricated snack pieces are fried or baked for varying lengths of time, typically on the order of about 10 seconds to about 3.5 minutes. During frying the pieces absorb a substantial quantity of the frying fat, generally on the order of from about 20% to about 50% by weight of the cooked and seasoned snack or chip. Typically, a digestible-fat, e.g., soybean oil, cottonseed oil or peanut oil is used for cooking. These oils have a caloric content of about 9 calories per gram of oil digested. A fried corn snack can contain from about 20 grams to 50 grams of digestible-fat per 100 grams of product which contributes from 180 to 450 calories per 100 grams of product. A single serving of regular corn chips weighs about 30 grams. Five grams of absorbed digestible fat in a regular corn chip serving contributes about 45 calories.

Prior art corn chips as well as chips made from corn blended with other grains that are cooked in reduced calorie fat or nondigestible fat substitutes are not fat free because many of the other corn chip ingredients and the corn itself contain significant levels of digestible fats. Thus, corn chips made with nondigestible fat substitutes contain too much digestible fat to be labelled as fat free fried corn chips and therefore are heretofore unknown.

Many people who enjoy eating corn chips also want to or need to reduce the level of real digestible fat in their diets. It is therefore an object of the present invention to provide a 30 gram serving of fat free corn chips. It is another object of the present invention to provide a method for making a

fat free corn chip.

SUMMARY OF THE INVENTION

The present invention relates to digestible fat free corn chips which contain less than 0.5 gm digestible fat in a 30 gm serving. The fat-free corn chips
5 comprise:

up to about 50% of corn masa; a fat free filler selected from the group consisting of starch, protein and nondigestible fiber, and mixtures thereof; a nondigestible fat substitute; and other essentially fat free ingredients selected from the group consisting of salt, emulsifiers and fat free seasonings and
10 combinations thereof.

The corn chips comprise from about 20% to about 50% corn; from about 20% to about 62% fat-free filler; from about 1% to about 35% nondigestible fat substitute; from 0% to about 4% preferably 0.5 to 3% moisture; and from 0% to about 10% of other essentially fat free ingredients. Any residual or intrinsic
15 digestible fat in a 30 gram serving is negligible and according to a recognized nutritional authority the 30 gram serving of this invention is fat free.

In a further aspect the invention provides digestible fat free corn chips comprising on a dry weight basis, from 20% to 45% by weight of corn; from 20% to 50% by weight of fat free filler selected from the group consisting of starch,
20 protein and nondigestible fiber and mixtures thereof; from 23% to 35% by weight of nondigestible fat substitute; from 0% to 4% by weight moisture; and from 0% to 10% by weight of other essentially fat free ingredients selected from the group consisting of salt, emulsifiers and fat free seasonings and combinations thereof;

wherein said corn chip serving is made by the following process:

- 25 a) preparing raw corn chip pieces from an aqueous dough comprising from 50 parts to 70 parts by weight of a mixture of corn and fat free filler, the ratio of corn to fat free filler being from 68:32 to 30:70, and from 30 parts to 50 parts water by weight; and
- b) cooking said raw corn chip pieces in said nondigestible fat substitute at 300°F to 450°F (148.9°C to 232°C) to provide said digestible fat-free corn chips;

wherein a 30 gm serving of said corn chip has less than 0.5 gm digestible

fat.

Throughout the description and claims of this specification, the word "comprise" and variations of the word, such as "comprising" and "comprises", is not intended to exclude other additives, integers or process steps.

5

DETAILED DESCRIPTION OF THE INVENTION

The present invention relates to low moisture triglyceride-fat or digestible fat free cooked corn snack food products. These fat free snack food products comprise: corn flour or masa, a fat free filler selected from the group consisting of starch, protein and nondigestible fibers, water and a nondigestible fat substitute composition. The corn chips serving comprises from about 20% to about 50%
10 corn; from about 20% to about 62% fat-free filler; from about 1% to about 35% nondigestible fat substitute; from zero to about 4% moisture; and from zero to about 10% of other essentially fat free ingredients. The preferred "fat free" cooked corn snack food products surprisingly tastes very good even though it
15 contains less than 0.5 grams digestible fat per 30 grams of product. Preferred products surprisingly have acceptable greasiness impressions, good mouthfeel lubriciousness and taste very good.

The preferred fat free snack food products of this invention comprise:

- a) from about 20% to 45%, preferably 25 to 35% of corn masa;
- 20 b) from about 20% to about 50%, preferably 30 to 40%, of a fat free filler selected from the group consisting of starch, protein and nondigestible fibers; and mixtures thereof;
- c) from zero to 10%, preferably 0 to 6% and more preferably 2 to 6%, seasonings.
- 25 d) from about zero to about 4%, preferably 0.5 - 3%, water; and
- e) from about 1% to about 35%, preferably 25-32%, of a nondigestible fat substitute composition.

The process for preparing the fat-free corn chips serving comprises:

- 30 a) preparing raw corn chip pieces from an aqueous dough comprising from about 50 parts to about 70 parts of a mixture of corn masa and a fat free filler selected from the group consisting of starch, protein and nondigestible fiber; and mixtures thereof; said dough comprising from

about 30 parts to about 50 parts water by weight of said dough;

b) cooking said raw corn chip pieces with nondigestible fat substitute at 300°F to 450°F (148.9°C to 232°C) to provide said cooked corn chips; and

5 c) optionally adding other ingredients that are essentially digestible fat free; wherein said other essentially fat free ingredients are selected from the group consisting of salt, emulsifiers and fat free or low fat seasonings and combinations thereof;

wherein said corn chips comprises up to 50% corn ingredients.

10 In a particularly preferred embodiment the fat free fiber to a mixture of equal amounts of starch fiber and protein. The nondigestible fat substitute component preferably comprises a blend of a liquid nondigestible oil and nondigestible solid polyol polyester or other nondigestible solid. The preferred
15 control passive oil loss upon ingestion of the liquid nondigestible oil.

As used herein, the term "low moisture food" refers to a food having an end product moisture content of about 5% or less, preferably about 4% or less, more preferably about 3% or less, and most preferably less than 2%.

20 As used herein, "digestible fat" or "triglyceride fat" refers to a fat or oil which can be digested by animals or humans. These are generally triglycerides of fatty acids, but can include mono and diglycerides.

As used herein "fat free" refers to foods which are substantially free of digestible fat, i.e. contain less than 0.5gm per 30gm serving.

The cooked snack food products of this invention are corn chips, for

25

example, fried, baked and/or extruded salted snacks such as corn chips, tortilla chips, corn sticks, corn curls and corn puffs, pellet snacks, half products, crackers and other extruded snacks based on corn.

Com

Corn flour, meal or masa can be used herein. These corn products contain corn oil. When corn is converted to masa, the masa can also contain corn oil, a digestible fat. The lower the digestible fat content of the corn masa, the better for use herein. The snack food products of this invention preferably contain an intrinsically low fat corn masa. A low fat corn masa comprises less than 4% edible triglycerides of fats. Highly preferred corn masas have only about 2% digestible fat or corn oil. Examples of some corn masa and their fat levels are set out below in Table 1.

Table 1

Fat Content of Different Commercial Dry Masa

DRY MASA	FAT %
Azteca Yellow	3.6
Azteca White	4.0
Illinois Yellow	2.7
Illinois White	2.5
Quaker Yellow	4.0
Quaker White	3.8
ConAgra Yellow	3.5

Fat Free Filler

Starch is a preferred fat free filler. The starch can be derived from any grain or vegetable such as corn starch, wheat starch, tapioca, potato starch and rice starch. The following is a list of non-starch polysaccharides and proteins that are also utilized, either alone or in combinations, as fillers for the fat free corn-based snacks of this invention. These fat free fillers are free of digestible fats or oils.

Non-Starch Polysaccharides

Cellulose

Cellulose Ethers, e.g. Methylcellulose, Hydroxypropyl methylcellulose and Hydroxypropyl cellulose

Carboxymethyl cellulose

Microcrystalline cellulose

Fiber (such as oat fiber or other non-digestible edible fibers derived from grains, fruits and vegetables)

Polydextrose

Citrus Absorbing Material which is a modified fiber described in U.S. 4,783,239 and U.S. 4,875,974 issued to T. F. Rich

Pectins

Gums, e.g. Alginates, Carrageenans, Guar gum, Locust bean gum, Gellan gum, Gum Tragacanth, Gum Acacia, Gum Tragacanth, Gum Ghatti, Gum Karaya

Proteins

The protein can be derived from any suitable source such as:

Total milk protein (dried precipitate of casein and whey)

Dried whey

Whey protein concentrate

Whey protein isolate

Casein, e.g. acid casein or rennet casein

Caseinates, e.g. sodium caseinate, potassium caseinate, calcium caseinate

Nonfat dry milk

Soybean flour (defatted)

Soy protein concentrate

Soy protein isolate

Cereal proteins, e.g. Vital wheat gluten

Oat bran

Corn protein isolate

Nuts, e.g., peanuts, walnuts, pecans, etc.

Dough Formation

A particularly important aspect of the process herein is the formation of the dough. The dough is formed by combining corn masa, starch based flour or other fat-free filler and water. Optional material such as emulsifiers, salts, flavorants, preservatives, calcium carbonate and hydrolyzed starches can also be added to the dough. Any conventional mixing techniques can be used to form the dough.

Sheeting, Snack Piece Formation and Frying

Once prepared, the dough is then formed into a relatively flat, thin sheet. Any method suitable for forming such sheets from starch based doughs can be used. For example, the sheet can be rolled out between two

counter rotating cylindrical rollers to obtain a uniform, relatively thin sheet of dough material. Any conventional sheeting, milling and gauging equipment can be used.

Doughs of the present invention can be formed into a sheet having a thickness of from about 0.015 to about 0.035 inches (from about 0.038 to about 0.09 cm), and preferably to a thickness of from about 0.015 to about 0.025 inches (from about 0.038 to about 0.062 cm).

The dough sheet is then formed into snack pieces of a predetermined size and shape. These snack pieces can be formed using any suitable stamping or cutting equipment.

The snack pieces can be formed into a variety of shapes. For example, the snack pieces can be e.g., ovals, squares, circles, a bowtie, a star wheel, or a pin wheel.

The snack pieces are fried in a non-digestible fat, preferably by a continuous frying method. The snacks can be constrained during frying in an apparatus as described in U.S. 3,626,466 (Liepa, 1971). The dough pieces are cut from the sheet, shaped using a movable, apertured mold half to shape the cut dough pieces and then held during subsequent frying by a second apertured mold half. A reservoir containing a frying medium is used. The shaped, constrained pieces are passed through the frying medium until they are crisp and have a final moisture content of from about 0.5% to about 4%. Continuous frying or batch frying of the snack pieces in a non-constrained mode is also acceptable. In this method the pieces are immersed in the oil on a moving belt or basket.

If desired, the snack pieces can be fried to moisture contents of 10% or less and then heated with hot air, superheated steam or inert gas to lower the moisture level to 4% or less. This is a combined frying/baking step.

The snack pieces are fried at temperatures between about 300°F (148°C) and 450°F (232°C). The exact fry time is controlled by the temperature of the oil and the starting water content. The fry time and temperature is easily determined by one skilled in the art.

The snack pieces can also be coated with a non-digestible fat and baked using radiant, convection or microwave heating to lower the moisture content. The coating can be accomplished by dipping, spraying, surface application, etc. See U. S. Patent 4,806,377, issued February 21, 1989, to Ellis et al., for "Waxy Corn Masa Based Products and Method of Making" for its teaching of corn types and general corn chip making details.

The ingredients of the low moisture cooked snack food products of the present invention, the relationship of the ingredients, and the preparation of the snack food products herein, are described in detail as follows:

I. **Ingredient Materials**

The materials used to prepare the nondigestible low moisture cooked snack food products of the present invention include an edible substrate, the formal snack dough, and a nondigestible fat substitute composition which is incorporated into and/or onto the edible substrate.

A. **Edible Substrate: Corn Masa and Non-Fat Solid**

The edible substrate can comprise corn chip pieces or fabricated pieces. As used herein, the term "fabricated pieces" refers to corn dough pieces obtained from a dough sheet formed from aqueous corn masa and fat free filler solids. The dough comprises from about 30% to 50% water, 40% to 50% corn masa, 0% to 5% emulsifier and about 20% to about 50% fat free filler. The ratio of corn to fat free filler is from about 68:32 to 30:70.

B. **Nondigestible fat substitute Compositions**

Another essential ingredient of the low moisture cooked snack food products of the present invention is a nondigestible fat substitute composition. All edible nondigestible fat substitutes are included. Such nondigestible fat substitute compositions contain a nondigestible fat substitute component and little or no conventional triglyceride-fat component.

For purposes of this invention a liquid oil is one which has a complete melting point below about 37°C. Suitable liquid nondigestible edible oils for use herein include liquid polyol fatty acid polyesters (see Jandacek; U. S. Patent 4,005,195; Issued January 25, 1977); liquid esters of tricarballylic acids (see Hamm; U. S. Patent 4,508,746; Issued April 2, 1985); liquid diesters of dicarboxylic acids such as derivatives of malonic and succinic acid (see Fulcher; U. S. Patent 4,582,927; issued April 15, 1986); liquid triglycerides of alpha-branched chain carboxylic acids (see Whyte; U.S. Patent 3,579,548; issued May 18, 1971); liquid ethers and ether esters containing the neopentyl moiety (see Minich; U.S. Patent 2,962,419; issued November 29, 1960); liquid fatty polyethers of polyglycerol (See Hunter et al.; U.S. Patent 3,932,532; issued January 13, 1976); liquid alkyl glycoside fatty acid polyesters (see Meyer et al.; U. S. Patent 4,840,815, issued June 20, 1989); liquid polyesters of two ether linked hydroxypolycarboxylic acids

(e.g., citric or isocitric acid) (see Huhn et al.; U.S. Patent 4,888,195I issued December 19, 1989); all of which are incorporated herein by reference, as well as liquid polydimethyl siloxanes (e.g., Fluid Silicones available from Dow Corning).

The preferred nondigestible fat substitute are fatty materials having properties similar to triglycerides such as sucrose polyesters but are not absorbed or digested by the body. A preferred sucrose polyester is OLEAN ® made by The Procter & Gamble Company. These preferred nondigestible fat substitute or oil substitute compositions are described in the literature, for example, in Young; U.S. Patent 5,085,884; Issued February 4, 1992, and U.S. Patent 5,422,131, issued June 6, 1995 to Elsen et al., incorporated herein by reference therefore.

The nondigestible fat substitute compositions comprise from about 99% to 100% nondigestible fat substitute and from 0% to about 1% triglyceride-fat. Preferably, such compositions comprise about 100% nondigestible fat substitute. The nondigestible fat is not counted in the calculation of "fat free".

II. Preparation of the Fat Free, Low Moisture Cooked Corn Snack Food

A. Incorporation of Nondigestible fat substitute Composition Into Edible Substrate

The low moisture cooked corn snack food products have a nondigestible fat substitute composition of the type described above incorporated into and/or onto an edible substrate of the type described above.

One means of incorporating the nondigestible fat substitute compositions into the edible substrate is to apply the nondigestible fat substitute composition to the exterior surface of the edible substrate. Snack food products prepared by applying the fat compositions to a portion or all of the surface of the edible substrate are referred to as fat-coated foods. The nondigestible fat substitute composition can also be incorporated into the interior of the edible substrate by mixing into the dough or through absorption into the snack during cooking or baking.

The low moisture snack food products herein are preferably coated with these compositions. The nondigestible fat substitute compositions can be applied by a variety of means including immersing, dipping, soaking,

spraying, blowing, pouring, pan coating, (e.g., in a revolving pan), tumble coating, brushing, applying with a roller, rolling around in a container of nondigestible fat substitute composition, falling film methods, enrobing, and curtain coating. The fat composition can be heated during application to the edible substrate, such as in the case of frying. If desired, the nondigestible fat substitute compositions can be applied to the surface of the food, followed by heating, such as baking. The nondigestible fat substitute composition can also be applied to the surface of a food that already contains fat. Once applied to the surface, the nondigestible fat substitute composition is typically absorbed into the interior of the food, such as in the case of fabricated corn snack, corn chips and tortilla chips.

Additional nondigestible fat substitute is added in a sprayer or enrober. For the nondigestible fat substitute compositions herein, the fat is heated to above 170°F (67°C) or its melt point before application to the snack or cracker. Preferably the nondigestible fat substitute composition is applied at temperatures of from 170°F (67°C) to about 250°F (121°C). To enhance the absorption of the nondigestible fat substitute into the snack, the snack is held for a period of time, generally from 1 to 5 minutes, at 67°C or above.

B. Providing the Desired Fat Content for the Finished Snack Food Product

Incorporation of the nondigestible fat substitute composition into the edible substrate according to the means described above may result in snack food products which are either too greasy or not lubricious. This is because the total nondigestible fat substitute content of the finished snack food product is either too high or too low. Snack food products with a total fat content of from about 35% to about 50% taste undesirably greasy.

1. Pre-Cooking Treatments

One way to provide snack food product having the desired fat content is to treat fabricated corn snacks or the dough used to prepare fabricated snacks prior to cooking. For example, the absorption of fat into fabricated snack during frying can be reduced by increasing the thickness of the snack pieces.

Another way to reduce the amount of fat absorbed by fabricated snack during frying is to partially dry the fabricated corn snack such as by convection or microwave heating prior to frying. In addition, coating of raw fabricated corn snack with a thin hydrocolloid film (e.g., cellulose ethers,

high amylose starch, protein, etc.) will limit fat absorption during frying and result in finished chips having a lower total fat content.

The amount of fat absorbed by fabricated snacks during frying can be limited by careful control of the dough moisture level prior to frying and/or by incorporating maltodextrin into the dough used to prepare the fabricated snacks. For baked snack food products, the fat content of the finished snack product can be controlled via formulation of the dough and the amount of topical nondigestible fat coating or fat addition.

A proofer box is used in tortilla snacks manufacturing to equilibrate the moisture within the dough before frying. This process can be used for the fabricated snacks herein.

2. Treatment of Edible Substrate During Cooking

When the nondigestible fat substitute composition is incorporated into the edible substrate by means of frying, the amount of fat absorbed by the edible substrate can be limited by frying at a low initial temperature with an increasing temperature profile through the fryer. (See Bensen et al. U.S. Patent 5,137,740 issued August 11, 1992 and Swedish Patent Application 1,519,049, published July 26, 1978). In addition, coating fabricated corn snack or fabricated snack products with a thin film of the nondigestible fat substitute composition and then baking in a convection or microwave oven can result in a desirable fat content for the finished snack product (see Dreher et al., U.S. Patent 4,756,916, Issued July 12, 1988; Yaun et al., U.S. Patent 4,283,425, Issued August 1981; and Mehta et al., Canadian Patent 1,151,945, Issued August 16, 1983).

3. Post-Cooking Treatments

Another way to provide snack food products having desirable nondigestible fat substitute content in the range of 1% to 35% is to remove a portion of the nondigestible fat substitute composition after it has been incorporated into and/or onto the edible substrate. The nondigestible fat substitute compositions may be removed from the snack food by any conventional post-fry treatment used for the removal of triglyceride-fats from snack food products. For example, the fat can be removed from the surface of the snack food product by steam stripping (see, for example, Neel et al., U.S. Patent 4,933,199, issued June 12, 1990 and Young et al., U.S. Patent 5,171,600, issued December 15, 1992) or by treatment of the snack food product with a solvent such as supercritical CO₂ or hexane to solubilize a portion of the surface and interior fat contained in the snack food product

(see, Goulston, U.S. Patent 3,127,271, Issued march 31, 1964; and Kazlas et al., World Patent Application US 91/05950 (publication number WO 92/03064), Published March 5, 1992). Nondigestible fat substitutes can also be removed from the surface of the snack food product by immersing the snack food product in an edible liquid displaying a low solubility for the nondigestible fat substitute composition, e.g. ethanol, for from about 0.5 to about 5 minutes to physically rinse the nondigestible fat substitute from the surface of the snack food products. Residual solvent on the snack food product is then removed by heating under vacuum.

In addition, the fat can be removed from the surface of the snack food product by contacting the snack food product with a blast of hot air or nitrogen following frying (see, for example, Bernard, U.S. Patent 4,537,786, issued August 27, 1985) or by centrifugation of fried snack food products while simultaneously contacting the snack food product with superheated steam, saturated steam, or a mixture of steam and hot dry air (see Hai et al., Canadian Patent 957,896, issued November 19, 1974).

ANALYTICAL TEST METHODS

A number of parameters used to characterize elements of the present invention are quantified by particular experimental analytical procedures. Each of these procedures is described in detail as follows:

Fat Content of Fabricated corn snack

The fat content of fabricated corn snack can be determined by Soxhlet extraction as follows:

Equipment/Reagents:

Soxtec HT6 Extractor, water bath, hot oil bath, extraction beaker, extraction thimble, vacuum drying oven, nitrogen purging gas, methylene chloride, boiling stones, glass wool

Procedure:

1. Weigh the extraction thimble (to four places 0.0001) and record as tare.
2. Load approximately 8-12 grams of ground chip sample into thimble and record as gross weight (to 0.0001).
3. Place glass wool on top of chip sample in thimble to contain the chips in the thimble.
4. Place 2-3 boiling stones into extraction beaker, weigh, and record weight as tare (to 0.0001).

5. Add 50 ml of methylene chloride to extraction beaker.
6. Load extraction beaker and the thimble containing the chip sample into extractor.
7. Set oil bath at 110°C and water bath at 28.3°C and allow to equilibrate.
8. Lower thimble into extraction beaker and allow to boil for 60 minutes, with the condenser pet cock opened.
9. Raise thimble out of extraction beaker and rinse for 60 minutes.
10. Turn the condenser's pet cock to closed position, purge with nitrogen and allow methylene chloride to evaporate for 60 minutes.
11. Place extraction beaker into vacuum oven at 120°C for 30 minutes.
12. Allow extraction beaker to cool to room temperature, weigh (to 0.0001) and record as final weight (weight beaker, boiling stones and extracted fat).

Calculations:

1. Chip Sample Weight = gross wt (step 2) - tare wt (step 1)
2. Extracted Fat wt = final wt (step 12) - tare wt (step 4)
3. Fat Content (%) = [Extracted Fat wt/chip sample wt] x 100

5. Moisture Content of Fabricated Low Moisture Snack

The moisture content of a snack food product can be determined by a forced air oven volatiles method as follows:

Equipment:

Forced air oven, aluminum tins with lids, Cabinet-type desiccator

Procedure:

1. Weigh tin and lid to 0.0001 grams and record weight as tare weight
2. Place 2-3 gram ground chip sample into tin, weigh to 0.0001 grams and record as gross weight
3. Set oven temperature to 105°C
4. Place tin containing the chip sample in oven for 1 hour, uncovered
5. Remove tin containing the sample from the oven, cover the tin, and place in desiccator until cooled to room temperature

6. Weigh tin, lid and dried sample to 0.0001 grams and record as final dried weight

Calculations:

1. Sample weight = gross wt. - tare wt.
2. Final weight = weight recorded in step 6
3. Moisture Content (%) = $[(\text{gross wt} - \text{final wt.})/\text{sample wt}] \times 100$.

Table 1**Ratios of Corn Masa to Fat Free Filler on a Dry Weight Basis**

Range:	68:32 to 30:70
Preferred Range:	50:50 to 43:57

PROCESS EXAMPLES**Process Example A**

The corn base and starch are pre-measured and added to a mixer. Measured amounts of distilled water (about 47 parts) and an effective amount (about 1 to 3 parts) of an essentially fat free emulsifier are placed into a container and heated to 100°F (38°C). The water and emulsifier are stirred briefly and then added to the mixer. The complete mixture is blended for 2 minutes, stopped and the sides scraped. The mixture is then blended for another 2 minutes. The blended material is transferred to a Farinograph equipped with a twin blade self-wiping mixing head, the head held at 100°F (38°C). The Farinograph is run at 100 rpm until a reading of 350 Brabender units (BU) is reached. The dough is formed. The dough is then removed from the mixing head, pushed into rough ball-shapes and transferred to the roll mill. Each ball is then passed through an 8" twin roll mill with a set gap of 0.3 to 0.5 millimeter to obtain a dough sheet thickness of about 0.64 millimeter. The sheet is then cut into corn chip pieces.

The dough pieces are deep fried in hot OLEAN®, a sucrose polyester frying oil for 20 to 25 seconds. The frying oil comprises a blend consisting of about 6% solid nondigestible particles and about 94% of liquid cottonseed sucrose polyester having the following attributes:

The OLEAN® used in Examples 1-3 is a 99.5% nondigestible-cooking-fat described herein above. The corn chips have about 0.4 g. of digestible-fat, i.e., less than 0.5 grams of digestible-fat (DF) per 30 grams of said product. They are essentially fat-free according to United States FDA nutrition authority. (See the U.S. FDA's guidelines in 21 CFR §101.62.) Yet

these snack food products taste very good.

The liquid sucrose polyester OLEAN® has the following attributes:

Fatty Acid Composition*

<u>Fatty Acid</u>	<u>%</u>
C14	0.5
C16	20.3
C18:0	6.2
C18:1	37.3
C18:2	34.2
C18:3	0.3
C20	0.3
C22:1	—
C22:0	—
C24	—
Other	0.9

Ester Distribution

% Octa	74.6
% Hepta	25.0
% Hexa	<0.1
% Penta	<0.1
% Lower	<0.1

The frying oil has a Waxy/Greasy Thixotropic Area Value of 115 kPa/s. The oil enters the continuous fryer at a temperature of 350°F (177° C) and exits at approximately 330°F (166°C).

The solid nondigestible particles are formed from sucrose polyesters in which the ester groups are formed from fatty acids derived from soybean oil and C₂₂ saturated fatty acids. The solid sucrose polyester has the following attributes:

Example 1

	Mass	% DFAT	Total DFAT
Starch	20.6	0.00%	0.00
Corn	43.4	2.70%	1.17
OLEAN	32.0	0.50%	0.16
Water	2.0	0.00%	0.00
Emulsifier	0.5	0.50%	0.00
Misc.	1.5	0.00%	0.00
DFAT	100.0		1.33
	0		

DFAT per 30 = 0.27 gm

*OLEAN is a commercially available nondigestible frying fat sold by Procter & Gamble, Cincinnati, Ohio.

A 30 gram serving of these corn chips of this Example is essentially fat free having a negligible level of digestible fat per serving. Starch is a fat free filler. OLEAN is a nondigestible fat substitute. The level of digestible fat in the corn masa for this example is about 0.27 gm per serving. DFAT means digestible fat. The ratio of corn and starch (FFF) in Example 1 is about 68:32. The ratio of the corn plus the FFF and the balance of the corn

chips is about 64:36.

Example 2

	Mass	(% DFAT)	Total DFAT
Starch	49.7	(0.00%)	0.00
Corn	21.3	(4.00%)	0.85
OLEAN	25.0	(0.50%)	0.13
Water	2.0	(0.00%)	0.00
Emulsifier	0.5	(0.50%)	0.00
Misc.	1.5	(0.00%)	0.00
DFAT	100.0		0.98
	0		
DFAT per 30 g			= 0.29 gm.

The level of digestible fat in the corn for this example is 4%. The ratio of corn and starch (FFF) in Example 2 is about 30:70. The ratio of the corn plus the FFF to the balance of the corn chips is about 71:29. A 30 gram serving of these corn chips of this Example is essentially fat free having a 0.29 gram of DFAT per serving.

Example 3

	Mass	(% DFAT)	Total DFAT
Starch	32.0	(0.00%)	0.00
Corn	32.0	(3.00%)	0.96
OLEAN	32.0	(0.50%)	0.16
Water	2.0	(0.00%)	0.00
Emulsifier	0.5	(0.50%)	0.00
Misc.	1.5	(0.00%)	0.00
Total	100.0		1.12
	0		
DFAT per 30 gms			= 0.34 gm.

A 30 gram serving of these corn chips is essentially fat free having a 0.34 gram of digestible fat per serving. The ratio of corn and starch (FFF) in Example 3 is about 50:50.

Process Example B

Fabricated corn chip dough pieces are prepared.

Tortilla chips are prepared from alkali-treated low digestible fat containing corn dough, i.e. masa. To prepare masa, dried corn is steeped in a water and lime solution (pH = 11.2) in a steam-jacketed vessel. The mixture is heated to boiling and then cooled to between 115°F and 140°F. The corn is allowed to soak for 8 to 24 hours until the moisture content of the corn reaches about 50% (Note that the moisture level can be allowed to reach from 30 to 80%; 40 to 60% moisture is preferred and more preferred is 45% to 55%).

Following steeping, the corn is washed and then uniformly ground or milled into a masa dough.

A fat free filler is added to the milled corn masa and uniformly ground or milled into a dough. The fat free filler preferably starch, is added to reduce the level of digestible-fat (DF) in the corn masa dough so that the final product is fat free i.e., contains is less than about 0.5 grams of digestible fat per 30 grams of product.

The masa dough is sheeted at a thickness of about 0.050" and 0.060" and cut into dough pieces. The dough pieces can be partially baked in an oven for 12 to 18 seconds at a temperature between 750°F (400°C) and 900°F (482°C) to lower the moisture level. The moisture content of the partially cooked dough pieces exiting the oven are between 35% and 40%.

The dough pieces are then batch fried in a 5-lb. capacity batch fryer containing frying oil. The frying oil comprises 100% of a sucrose polyester blend comprising about 6% solid nondigestible particles and about 94% liquid soybean oil sucrose polyester. The Waxy/Greasy Thixotropic Area Value of the frying oil is 75 kPa/s. The frying oil is maintained at a temperature of 365°F (185°C). The dough pieces are fried for about 90 seconds.

Upon removal from the fryer, they are seasoned for serving. A 30 gram serving these cooked and seasoned tortilla chips are digestible-fat free with a nondigestible-fat content of about 26.8% and a moisture content of about 1.0%.

Process Example C

The same as Process Example A except that the chips are baked rather than fried.

Other Product Examples

Example 4

	Mass	(% DFAT)	Total DFAT
Starch	38.7	(0.00%)	0.00
Corn	29.8	(4.00%)	1.19
OLEAN	27.5	(0.50%)	0.14
Water	2.0	(0.00%)	0.00
Emulsifier	0.5	(0.50%)	0.00
Misc.	1.5	(0.00%)	0.00
Total	100.0		1.33
	0		
DFAT per 30 gms			= 0.40 gram

The corn chips of this Example have a negligible 0.4 gram of digestible fat (DFAT) per 30 gram serving. The ratio of corn and fat free filler starch (FFF) in Example 4 is about 44:56. The ratio of the corn plus the fat free filler and the balance of the chips is about 69:31 and the ratio of the corn plus the fat free filler and the non-digestible fat is about 71:29.

Example 5

	Parts	% DFAT	(% DFAT)
Starch	34.7	0.00	(0.00%)
Corn	38.8	1.55	-
OLEAN	23.0	0.12	(0.50%)
Water	2.0	0.00	(0.00%)
Seasoning.	1.5	0.00	(0.50%)
Misc.			(0.00%)
Total	100	1.67	
Total DFAT per 30g		Under 0.50 gm	

The corn chips of this Example have a negligible level of digestible fat per 30 gram serving.

Example 6

	Mass	(% Fat)	Real Fat
Fat Free Filler	38.7	(0.00%)	0.00
Corn	29.8	(4.00%)	1.19
OLEAN	27.5	(0.50%)	0.14
Water	2.0	(0.00%)	0.00

THE CLAIMS DEFINING THE INVENTION ARE AS FOLLOWS:

1. Fat free corn snacks comprising a mixture of 20% to 50% by weight corn; 20% to 62% by weight fat free filler selected from the group consisting of starch, protein and nondigestible fiber, and mixtures thereof; from 1% to 35% by weight nondigestible fat substitute; and from 0% to 10% by weight essentially fat free ingredients selected from the group consisting of salt, emulsifiers and fat free seasonings and combinations thereof, wherein said snack contains less than 0.5 gram of digestible fat per 30 gram serving.

10

2. A corn snack according to claim 1 wherein the ratio of said corn to said fat free filler is from 68:32 to 30:70.

3. A corn snack according to claim 2 comprising: from 25 to 35% by weight of said corn; from 30 to 40% by weight of said fat free filler; from 0% to 6% by weight of said salt and other seasonings; from 0.5 to 3% by weight moisture; and from 25 to 32% by weight of said nondigestible fat substitute.

4. A corn snack according to any one of claims 1 to 3 wherein said fat free filler is starch.

5. A corn snack according to any one of claims 1 to 3 wherein said filler is protein.

6. A corn snack according to any one of claims 1 to 3 wherein said fat free filler is fiber.

7. A corn snack according to any one of claims 1 to 3 wherein said fat free filler is a mixture of equal amounts of starch, fiber and protein.

30

8. Digestible fat free corn chips comprising on a dry weight basis, from 20% to 45% by weight of corn; from 20% to 50% by weight of fat free filler selected

from the group consisting of starch, protein and nondigestible fiber and mixtures thereof; from 23% to 35% by weight of nondigestible fat substitute; from 0% to 4% by weight moisture; and from 0% to 10% by weight of other essentially fat free ingredients selected from the group consisting of salt, emulsifiers and fat free seasonings and combinations thereof;

5

wherein said corn chip serving is made by the following process:

- a) preparing raw corn chip pieces from an aqueous dough comprising from 50 parts to 70 parts by weight of a mixture of corn and fat free filler, the ratio of corn to fat free filler being from 68:32 to 30:70, and from 30 parts to 50 parts water by weight; and
- b) cooking said raw corn chip pieces in said nondigestible fat substitute at 300°F to 450°F (148.9°C to 232°C) to provide said digestible fat-free corn chips;

10

wherein a 30 gm serving of said corn chip has less than 0.5 gm digestible fat.

15

9. A corn snack according to claim 1 substantially as hereinbefore described with reference to any one of the Examples.
