(54) Title: SMALL-MOLECULE HYDROPHOBIC TAGGING OF FUSION PROTEINS AND INDUCED DEGRADATION OF SAME

(57) Abstract: The present invention relates to the ability to regulate any protein of interest in living systems with small molecules. In particular, the present invention relates to the discovery that appending a hydrophobic moiety to the surface of a protein can mimic the partially denatured state of the protein, thus engaging the cellular quality control machinery to induce its proteasomal degradation. An aspect of the present invention relates to bifunctional small molecules that bind a number of proteins, including, for example, a self-labeling tag such as bacterial dehalogenase (HaloTag protein) and present a hydrophobic group on its surface. Hydrophobic tagging of the HaloTag protein with a hydrophobic moiety (e.g. an adamantyl moiety) was effected and the tagging induced the degradation of cytosolic, isoprenylated, and transmembrane fusion proteins in cell culture. The present invention also demonstrated the in vivo utility of hydrophobic tagging by degrading proteins expressed in zebrafish embryos and by inhibiting RasG12V-driven tumor progression in mice. Therefore, hydrophobic tagging of HaloTag fusion proteins affords small molecule control over any protein of interest, making it an ideal system for validating potential drug targets in disease models.

Small-Molecule Hydrophobic Tagging of Fusion Proteins and Induced Degradation of Same

Field of the Invention

The present invention relates to compounds and compositions which may be used to perturb and/or disrupt the function of a transmembrane or intracellular protein in order to identify or validate that protein as a protein of interest. In addition to compounds and methods, the present invention is also directed to a method of identifying or validating a protein as a protein of interest for use as a bioactive agent (drug) target for therapy of a disease state or condition.

Related Applications and Government Support

The present invention claims priority from provisional applications serial numbers 61/420,584, filed December 7, 2010, entitled "Regulation of Protein Function in Live Animals via Hydrophobic Tagging", and 61/530,014, filed September 1, 2011 of identical title to the present application, the entire contents of which applications are incorporated by reference herein.

This invention was made with government support under grant no. R01AI084140 awarded by National Institutes of Health (NIH). The government has certain rights in the invention.

Background of the Invention

One of the central challenges of chemical biology remains the ability to perturb the function of any intracellular protein using a small molecule. While significant strides have been made towards developing individual ligands to specific proteins, only approximately 300 molecular targets for approved drugs have been characterized¹. Furthermore, the fraction of the proteome classified as "undruggable" by current methods is estimated to be about 80%². It is likely that many appealing drug candidates have yet to be found and that future advances in drug development will be able to overcome the boundaries of what is thought to be an "undruggable" target^{3,4}. Therefore, the challenge for biologists remains to identify

those disease-causing drug targets. To this end, advances in deep sequencing, microarray technology and genome-wide RNAi screens have been employed successfully to identify promising new drug targets. For instance, genome-wide RNAi screens have been employed to identify synthetic lethal interactions with mutated oncogenes and to identify genes necessary for various pathogenic infections⁵⁻⁷.

While target identification is an obvious important first step in drug development, the *in vivo* validation of these potential targets remains a challenge. This is due in part to the unpredictable pharmacokinetics/pharmacodynamics of any inhibitory compound identified based on *in vitro* inhibition of protein function. In other words, is the failure of a small molecule inhibitor to give the desired *in vivo* result an unforeseen consequence of its *in vivo* metabolism or is its target protein simply a poor drug target? To address this question, general methods are needed to functionally validate whether modulation of a putative disease-relevant protein leads to the desired *in vivo* result. RNAi offered initial promise for organismal validation of putative drug targets, however, the delivery and stability of duplex RNA remain major hurdles in knocking down mRNA expression in a whole animal setting⁸. In the absence of a direct ligand for the target protein, there are currently three categories of small molecule-based methods to control the function of a protein of interest (POI)⁹. First, the plant hormone auxin can be employed to dimerize a plant E3 ubiquitin ligase (TIR1) with a domain from the AUX/IAA transcriptional repressor (Aid1), which when fused to a POI can be ubiquitinated by proximity to TIR1¹⁰. This method requires fusing the POI to Aid1, along with an introduction of the plant E3 ligase TIR1 into cells. A second general method used to deregulate protein function involves dimerization of FKBP12 and the FKBP12-rapamycin binding (FRB) domain from mTOR. It has been shown that a POI can be recruited to the proteasome or to the mitochondrial outer membrane by this method¹¹⁻¹³. Again, at least two fusion proteins must be introduced into the cell for this system to function⁹. Lastly, two destabilizing domains (DDs), one based on the FKBP12 protein and the other on *E. coli* DHFR protein^{14,15}, have been developed to destabilize a DD-POI fusion protein. The degradation conferring DD can be stabilized by inclusion of derivatives of FK506¹⁶ (in the case of mutagenized FKBP12) or the *E. coli* DHFR inhibitor trimethoprim (in the case of DHFR), ultimately leading to increased levels of the fusion protein. While the DD method has been successfully used in several studies¹⁷⁻²⁰, it requires the continued presence of the ligand for stable expression of the fusion protein. This requirement can be a concern when studying developing embryos, which might not receive sufficient stabilizing

ligand, or when studying the long term effects of a POI, in which case the ligand would have to be injected into an animal for the duration of the study. Also, in the case of the long-term expression of the POI, one must bear in mind the possible fluctuations of the POI levels that are due to the intermittent injections of the stabilizing ligand.

Brief Description of the Invention

The present invention is directed to a hydrophobic compound comprising a hydrophobic moiety linked to a reactive linker, preferably a haloalkane reactive linker (i.e., a linker which contains a haloalkane moiety which is reactive with a halogenase/hydrolase self-labeling tag, such as halotag) which forms a covalent bond with the fusion protein linking the hydrophobic compound to the fusion protein. Compounds according to the present invention are useful for binding a fusion protein wherein the fusion protein comprises a protein of interest (e.g., a potential drug or other physiological target) and a self-labeling tag (such as a halotag, snaptag, cliptag, ACPtag, MCPtag, among others) which is useful for binding the hydrophobic compound to the fusion protein. In preferred aspects of the invention the hydrophobic compound comprises a haloalkane reactive linker to which the hydrophobic moiety may be linked to the fusion protein through action of a halogenase self-labeling tag (e.g. HaloTag) on the haloalkane reactive linker. Once reacted, the hydrophobic moiety is covalently bonded to the fusion protein. It has been unexpectedly discovered that the hydrophobic moiety covalently linked to the fusion protein produces degradation of the fusion protein (through interaction/degradation with the protein of interest) resulting in a denaturation of the protein and proteasomal degradation of the fusion protein. The action of the hydrophobic moiety linked to the fusion protein in degrading the fusion protein may be used in assays to determine the importance of the protein of interest to a biological process, for example, the modulation of a disease state or condition such as the growth or inhibition of a cancer cell or tissue. Determining the importance of the protein of interest may be used to establish the protein of interest as a potential target of bioactive agents, including small molecule pharmaceutical agents for the treatment of a disease state or condition which is modulated by the protein of interest.

In a method according to the present invention to determine if a protein of interest is a potential bioactive agent (e.g. drug) target, a hydrophobically labeled fusion protein comprising a protein of interest is exposed to cells and the impact of the degradation of the

hydrophobically labeled fusion protein in or on the surface of the cells is measured to determine if the protein of interest is a potential drug target (i.e., modulates a disease or condition for which drug or other therapy may prove useful). In preferred embodiments, this method comprises covalently attaching a fusion protein comprising a protein of interest and a self-labeling polypeptide to a hydrophobic moiety. This can be achieved by expressing the two polypeptides as a fusion protein.

In a first method aspect, the present invention comprises the steps of:

1. Providing a hydrophobically labeled fusion protein wherein said fusion protein comprises a protein of interest and a hydrophobic moiety covalently linked to said fusion protein wherein said hydrophobic moiety is capable of degrading said fusion protein intracellularly or on the surface of cells;
2. Exposing cells which utilize said protein of interest to said hydrophobically labeled fusion protein (e.g. by intracellular expression of the fusion protein or by exposure of the cells to the fusion protein), wherein the fusion protein may be optionally and preferably labeled with the hydrophobic moiety within or on the surface of said cells by a small molecule that labels self-labeling polypeptide of the fusion protein with a hydrophobic moiety;
3. Measuring the degradation of the fusion protein in or the surface of the cells; and
4. Determining if the degradation of the fusion protein modulates the biological activity of the cells through a change in a phenotypic response of the cells (e.g., a change in the growth and/or activity of the cells which is identified) consistent with the protein being a potential target for a bioactive agent (e.g. drug) for a disease and/or condition modulated through said protein of interest.

In preferred aspects, the method according to the present invention utilizes a fusion protein comprising a protein of interest and a self-labeling polypeptide to hydrophobically label the fusion protein to determine if the protein of interest is a potential bioactive agent (e.g. drug) target. This method comprises the steps of:

1. Providing a fusion protein comprising a protein of interest and a polypeptide self-labeling tag *in vitro* or *in vivo*, including intracellularly or on the surface of cells;
2. Covalently linking said fusion protein to a compound comprising a hydrophobic group (preferably, other than a fluorescent moiety having a Clog P of at least about 1.5) and a reactive linker, wherein the reactive linker is a substrate for the self-labeling tag which

wherein said hydrophobic group is covalently linked to said fusion protein, thus producing a hydrophobically labeled fusion protein;

3. Optionally, isolating said hydrophobically labeled fusion protein;
4. Exposing cells which utilize said protein of interest to said hydrophobically labeled fusion protein;
5. Measuring the degradation of said fusion protein in or on the surface of said cells; and optionally
6. Determining if said degradation of said fusion protein modulates biological activity of said cells (through a change in a phenotypic response of the cells, e.g., a change in the growth and/or activity of the cells which is identified) consistent with the protein being a potential target for a bioactive agent (e.g. drug) for a disease and/or condition modulated through said protein of interest.

In alternative aspects of the invention, the present invention is directed to a method of inducing degradation of a fusion protein in a cell, the method comprising the steps of

1. expressing a fusion protein in a cell wherein said fusion protein comprises a protein of interest and a self-labeling polypeptide tag;
2. reacting intracellularly or on the surface of said cell said expressed fusion protein with a compound comprising a hydrophobic group and a group reactive with said self-labeling polypeptide tag, wherein said compound upon reaction with said self-labeling polypeptide tag forms a covalent bond with said fusion protein to form a hydrophobically labeled fusion protein; and
3. allowing said fusion protein to degrade in or on the surface of said cell.

In preferred aspects of the invention, the fusion protein is produced and hydrophobic labeling of the fusion protein occurs in or on the surface of the same cells in which the protein of interest is utilized so that determination of the relevance of the protein of interest occurs in the same cells in which fusion protein is produced and the produced fusion protein is hydrophobically labeled. Thus, in certain preferred aspects of the invention the fusion protein is covalently linked to the hydrophobic moiety through the reactive linker *in vivo*/intracellularly or on the surface of cells by expressing the fusion protein intracellularly (including in test animals, such as a mouse, rat or other mammal) and exposing the fusion protein to a compound comprising the hydrophobic moiety and reactive linker (e.g., the compound may be administered *in vivo* to the test animal or exposed to the cells growing in

medium), wherein the hydrophobic moiety linked to the fusion protein will cause the fusion protein to degrade intracellularly or on the surface of cells with a possible resulting and measurable phenotypic response consistent with the the protein of interest being a potentially important drug target. It is noted that fusion proteins may be produced intracellularly and anchored on the surface of a cell through the use of signal and/or anchor peptide sequences which are native to a cell or expressed with the fusion protein. Such an approach is well known in the art and allows a fusion protein to be expressed and anchored on a cellular surface for attachment of a hydrophobic moiety. It is contemplated that the present invention is applicable to proteins which function on the surface of cells, as well as proteins which function internally in cells.

In the present invention, the fusion protein comprises a protein of interest and a polypeptide self-labeling tag (e.g. a Halotag, a Snaptag, a Cliptag, a ACP tag or a MCP tag) to which the hydrophobic moiety can be bound through a reactive linker. In the case of the Halotag fusion protein, the reactive linker contains a haloalkane group which reacts with the halogenase of the Halotag to produce a covalent bond with the fusion protein. In the case of a Snaptag fusion protein, the reactive linker contains a benzyl guanine substrate which reacts with the the DNA repair protein O⁶-alkylguanine-DNA alkyltransferase to afford a covalently linked hydrophobic moiety on the fusion protein. In the case of a Cliptag fusion protein, the reactive linker contains a O2-benzylcytosine moiety in order to afford the covalently linked hydrophobic moiety on the fusion protein. In the case of a ACP tag, the reactive linker contains a coenzyme A derivative (CoA derivative) which is covalently bonded through a post-translational modification catalyzed by the acyl carrier protein (ACP) phosphopantetheinyl transferase AcpS (ACP synthase). In the case of a MCP tag (mutant), the reactive linker contains a coenzyme A derivative which is covalently bonded through a post-translational modification catalyzed by a phosphopantetheinyl transferase Sfp (SFP synthase), but *not* AcpS. It is noted that the ACP and MCP tags are useful for providing hydrophobically labeled fusion proteins which are unable to penetrate cells- they are limited in their use to proteins of interest which are surface proteins.

In the above-described in the measuring step, degraded protein may be quantified by measuring non-degraded or degraded fusion protein in or on the surface of said cells using standard methods for identifying and quantifying proteins. These methods include, *inter alia*, using protein specific antibodies linked to a reporter, such as a fluorescent or other reporter,

such methods including immunoassay (e.g. ELISA, among others) and immunoblot, absorbance assays, mass spectrometric methods and proteomics methods, among numerous others. Methods for quantifying specific proteins in samples are well known in the art and are readily adapted to methods according to the present invention. Assaying for degraded protein and the impact of such degradation on the function of a cell, for example, the growth and/or proliferation of the cell (e.g., cell death) or other characteristic (e.g. biological, physiological) of a cell evidences the importance of the protein of interest to cellular growth and function and establishes whether the protein of interest is a modulator of a disease state or condition and thus a potential target (bioactive agent, including drugs) for the treatment of said disease state or condition. Identifying a protein of interest as a pharmaceutical target will allow the development of assays to identify compounds and other bioactive agents exhibiting activity as potential inhibitors and/or agonists of the protein of interest.

In one aspect, compounds according to the present invention may be represented by the general formula:

Where  is a hydrophobic group other than a reporter group (e.g. a fluorescent group) having a ClogP of at least about 1.5 or as specifically as otherwise described herein; and

is a linker group having a reactive moiety which reacts with a self-labeling polypeptide tag of a fusion protein comprising said self-labeling tag and a protein of interest

to form a covalent link between said  group and said fusion protein, wherein said hydrophobic group promotes the degradation of said protein of interest in said fusion protein

covalently linked to said  group.

In alternative embodiments according to the present invention, a compound according to the present invention comprises a compound according to the chemical structure:

Where  is a hydrophobic group other than a fluorescent moiety having a ClogP of at least about 1.5 or as otherwise specifically described herein;

 is a fusion protein comprising a protein of interest and a self-labeling polypeptide tag linked to said protein of interest in said fusion protein, said enzyme tag

covalently linking said  group to said fusion protein; and

L is a chemical linker which covalently binds said  group to said fusion protein, wherein said hydrophobic group promotes the degradation of said protein of interest

comprising a protein of interest covalently linked to said  group.

In preferred aspects of the invention,  compounds which may be used to covalently bind a hydrophobic moiety to a fusion protein, which preferably contains a self-labeling tag protein, have the chemical structure:

Where  is a hydrophobic group as otherwise described herein;

Z is a group which links  to X;

X is a group linking Z to group Y_R; and

Y_R is a group which is reactive with the fusion protein, preferably a self-labeling tag on said fusion protein, which forms a covalent bond connecting the hydrophobic group and the fusion protein.

In preferred aspects, Z is absent (a bond), -(CH₂)_i-O, -(CH₂)_i-S, -(CH₂)_i-N-R, a $\left(\text{CH}_2 \right)_i \text{X}_1 \text{Y}_1$ group wherein X₁Y₁ forms an amide group, or a urethane group, ester or thioester group, or a

Each R is H, or a C₁-C₃ alkyl or alkanol group;

Each Y is independently a bond, O, S or N-R;

and each i is independently 0 to 100, 1 to 75, 1 to 60, 1 to 55, 1 to 50, 1 to 45, 1 to 40, 2 to 35, 3 to 30, 1 to 15, 1 to 10, 1 to 8, 1 to 6, 1, 2, 3, 4 or 5;

Where each D is independently a bond (absent),

j is 1 to 100, 1 to 75, 1 to 60, 1 to 55, 1 to 50, 1 to 45, 1 to 40, 2 to 35, 3 to 30, 1 to 15, 1 to 10, 1 to 8, 1 to 6, 1, 2, 3, 4 or 5;

k is 1 to 100, 1 to 75, 1 to 60, 1 to 55, 1 to 50, 1 to 45, 1 to 40, 2 to 35, 3 to 30, 1 to 15, 1 to 10, 1 to 8, 1 to 6, 1, 2, 3, 4 or 5; preferably k is 1, 2, 3, 4, or 5;

m' is 1 to 100, 1 to 75, 1 to 60, 1 to 55, 1 to 50, 1 to 45, 1 to 40, 2 to 35, 3 to 30, 1 to 15, 1 to 10, 1 to 8, 1 to 6, 1, 2, 3, 4 or 5;

n is 1 to 100, 1 to 75, 1 to 60, 1 to 55, 1 to 50, 1 to 45, 1 to 40, 2 to 35, 3 to 30, 1 to 15, 1 to 10, 1 to 8, 1 to 6, 1, 2, 3, 4 or 5;

X¹ is O, S or N-R, preferably O;

Y is the same as above; and

CON is a bond (absent) or a

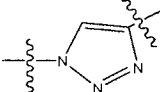

Where X² is O, S, NR⁴, S(O), S(O)₂, -S(O)₂O, -OS(O)₂, or OS(O)₂O;

X³ is O, S, NR⁴; and

R⁴ is H or a C₁-C₃ alkyl group, or

a pharmaceutically acceptable salt, enantiomer or stereoisomer thereof.

Preferably, **CON** is a  group or an amide group.

In preferred aspects, Y_R is a group which is reactive with a self-labeling tag of the fusion protein, wherein the self-labeling tag is preferably a Halotag, a Snaptag, a Cliptag, a ACPtag or a MCPtag. Preferably, the self-labeling tag is a Halotag, and the reactive substrate for the Halotag is a haloalkane group which is optionally substituted with one or two ether groups, preferably a C_2 - C_{12} chloroalkyl group which is optionally substituted with one (monoether) or two (diether) ether groups, even more preferably, a haloalkyl diether group. In preferred aspects the haloalkyl diether group is according to the chemical structure:

and forms a chemical structure with hydrophobic group and remaining portion of the linker according to the chemical structure:

Where , Z and X are as otherwise described above.

In alternative embodiments, where the fusion protein comprises a self-labeling tag as a Snaptag, Y_R is a benzylguanine group

which provides a compound according to the chemical structure:

Where , Z and X are as otherwise described above.

In alternative embodiments where the fusion protein comprises a self-labeling tag as a Cliptag, Y_R is a benzylcytosine group

which forms a compound according to the chemical structure:

Where , Z and X are as otherwise described above.

In further alternative embodiments, where the fusion protein comprises a self-labeling tag as a ACPTag or a MCPTag, Y_R is a coenzyme A derivative

which forms a compound according to the chemical structure:

Where **HYD**, Z and X are as otherwise described above.

Each of the above compounds will produce compounds covalently linked to fusion proteins by action of the self-labeling tag of the fusion protein on the reactive moiety of the compounds described above.

Representative compounds which are produced by action of a self-labeling tag are represented by the following structure:

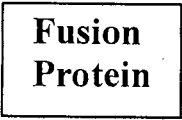

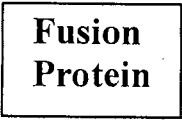

Where ,  , Z, X and  are as otherwise described above, and

Y_{Rp} is a chemical moiety which is formed by the action of the fusion protein, preferably the self-labeling tag protein of the fusion protein, on group Y_R .

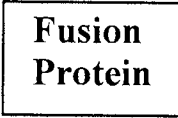

In the case of a fusion protein which comprises a halotag self-labeling tag protein, the reaction product is a compound according to the chemical structure:

Where ,  , Z, X and  are as otherwise described above. It is noted that the Y_{Rp} group (represented as the alkyl diether group) forms a covalent bond (through a nitrogen, oxygen or sulfur group represented as a X_{Fp} group) with the fusion protein.

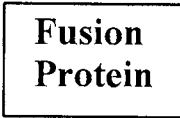

In the case of a fusion protein which comprises a snaptag or a cliptag self-labeling tag protein, the reaction product is a compound according to the chemical structure:

Where , Z, X and  are as otherwise described above. It is noted that the Y_{Rp} group (represented as a benzyl group) forms a covalent bond (through a sulfur group as represented) with the fusion protein.

In the case of a fusion protein which comprises a ACP or MCP self-labeling tag protein, the reaction product is a compound according to the chemical structure:

Where , Z, X and  are as otherwise described above. It is noted that the Y_{Rp} group forms a covalent bond (through an oxygen group with the phosphate as represented) with the fusion protein.

Brief Description of the Figures

Figure 1 shows a hydrophobic tagging strategy using the HaloTag fusion protein system (a) Chemical structures of the representative HaloTag Ligands: HyT5, HyT12, HyT13, HyT16, HyT21 and HyT22. (b) HEK 293T cells expressing HA-HaloTag-luciferase were treated with indicated compounds at 1 μ M for 24 hours, at which point luciferase assays were performed.

Figure 2 shows that HyT13 leads to degradation of HaloTag fusion proteins (a) Flp-In 293 cells expressing HA-EGFP-HaloTag were treated with indicated concentrations of HyT13 for 24 hours. The lysates were probed with anti-HA and anti- β -actin antibodies. (b) The same cell line as in (a) was treated for the indicated times with 1 μ M HyT13. The rightmost sample was treated with HyT13 for 24 hours, after which HyT13-free media was provided for 24 hours. (c) The same cell line as in (a) was pretreated with proteasome inhibitors MG132 (10 μ M) and YU101 (10 μ M) for 1 hour prior to addition of 1 μ M HyT13. The lysates were prepared from cells 6 hours after HyT13 addition. (d) HeLa cells stably expressing EGFP-HaloTag were treated with vehicle or 1 μ M HyT13 for 24 hours, whereupon the intracellular GFP fluorescence was quantified by flow cytometry. MFI = mean fluorescence intensity. (e) HEK 293T cells stably expressing indicated transmembrane HA-HaloTag fusion proteins were treated with 1 μ M HyT13 for 24 hours. Shown are representative images from at least three experiments; bands were quantified and mean degradation \pm SEM is shown. (f) One-cell stage zebrafish embryos were injected with 100 ng of HA-HaloTag-Smad5 cRNA, grown to 256-cell stage and then treated with 10 μ M HyT13 for 24 hours. Shown are representative images from at least three experiments; bands were quantified and mean degradation \pm SEM is shown.

Figure 3 shows the functional validation of HaloTag degradation by HyT13 (a) NIH-3T3 cells were retrovirally infected with a construct expressing either HA-HaloTag-HRas(G12V) or HA-HaloTag(D106A)-HRas(G12V). The cells were then treated with vehicle or 1 μ M HyT13 for 24 hours. The lysates were prepared for immunoblotting and the blots were probed with anti-HA and anti- β -actin antibodies. (b) One hundred thousand NIH-3T3 cells infected with HA-HaloTag-HRas(G12V) or HA-HaloTag(D106A)-HRas(G12V)

were plated in 10% FBS containing medium onto 10-cm plates. The next day, the medium was replaced with 1% FBS containing medium, along with vehicle or 1 μM HyT13. The media was refreshed every 2 days, and the plates were pictured on day 6. Bar, 5 mm. (c) Quantification of foci as described in (b). The number of foci/cm² was counted from three separate plates, with error bars representing SEM. (d) One hundred thousand HA-HaloTag-HRasG12V-expressing NIH-3T3 cells were injected into the flank of nude mice on day 0. The mice were administered IP injections of vehicle or HyT13 daily from day 0. Tumor size was measured daily, and the tumor volume was calculated. Each treatment group employed 7 mice. Error bars represent SEM.

Figure 4 shows the schematic of HyT13 mediated degradation of HaloTag fusion proteins. A fusion protein composed of a protein of interest and the HaloTag protein is degraded upon HyT13 treatment by the proteasome.

Figure 5 shows representative compounds which were synthesized and a number which were tested.

Figure 6 shows the concentration curve of HyT13. Flp-In 293 cells expressing HA-EGFP-HaloTag were treated with indicated concentrations of HyT13 for 24 hours. The lysates were probed with anti-HA and anti- β -actin antibodies, with β -actin serving as a loading control. Shown is quantification of three separate experiments, with error bars representing SEM.

Figure 7 shows the time course of HyT13 activity. Flp-In 293 cells expressing HA-EGFP-HaloTag cells were treated for the indicated times with 1 μM HyT13 and the lysates were probed with anti-HA and anti- β -actin antibodies. The rightmost sample was treated with HyT13 for 24 hours, after which HyT13-free media was provided for 24 hours. Shown is quantification of three separate experiments, with error bars representing SEM.

Figure 8 shows that compound HyT13 exhibits no toxicity at doses up to 20 μM HyT13. HEK293 or HeLa cells were treated with indicated concentrations of HyT13 for 24 hours. The oxidation-reduction indicator Resazurin (AlamarBlue, Invitrogen) was employed to determine cell viability. The proteasome inhibitor YU101 is toxic to cells at indicated concentration and served as a positive control for the assay.

Figure 9 shows that there was no observed toxicity in mice treated with HyT13. *Nude* mice were daily IP injected with indicated concentrations of HyT13 and were monitored for weight gain during the 14-day experiment. Shown is the percent weight gained during the 14-day period for each treatment group \pm SEM. Each treatment group consisted of 7 mice.

Figure 10 shows a serum HyT13 determination. Webster Swiss mice received IP injections of 25 mg/kg of HyT13. The injection volume was 10 μ L, consisting of 5 μ L of Cremophor EL excipient and 5 μ L of HyT13 in DMSO. Blood was collected from the carotid artery 1 and 24 hours after the injection. The blood was allowed to coagulate for 10 minutes, centrifuged at 10,000g for 5 minutes and the serum was pipetted into a new tube. Ten microliters of the serum were used for a bio-reporter assay, consisting of the ability to degrade luciferase activity in HEK 293T luciferase-HaloTag cells. The serum concentration of HyT13 was based on a concentration curve of HyT13 performed alongside the bio-reporter assay. No degradation activity was observed in serum from mice receiving no HyT13. Each treatment group consisted of three mice. Shown is the mean serum HyT13 level \pm SEM.

Figure 11 shows the results of a number of synthesized HyT compounds on the degradation of a green fluorescent protein halotag fusion protein at a concentration for each compound at 1 μ M.

Figure 12a-f shows representative immunoblot gel images of several fusion proteins degradations as described in the experimental section of the present application.

Figure 13 shows the immunoblot gel images of HA-HaloTag-HRas(G12V) fusion protein.

Figure 14 shows a number of representative hydrophobic moieties which are covalently linked to fusion proteins as otherwise described herein.

Figure 15 shows certain prototypical approaches to create hydrophobic tags (ClogP >1.5) according to the present invention having a haloalkane reactive linker so as to be able covalently link with a bacterial halogenase (halotag) polypeptide. Hydrophobic tags (HyTs)

can be prepared via the coupling of the commercial Promega reactive ligands and RCO_2H , RNH_2 , ROH , RCH_2X by standard synthetic chemical techniques.

Figure 16 shows ten representative polypeptide (amino acid) sequences for halotag, snaptag, cliptag, ACPTag and MCPtag self-labeling polypeptide tags used in the present invention.

Detailed Description of the Invention

In accordance with the present invention there may be employed conventional chemical synthetic methods, as well as molecular biology, microbiology, and recombinant DNA techniques within the skill of the art. Such techniques are well-known and are otherwise explained fully in the literature. See, e.g., Sambrook et al, 2001, "Molecular Cloning: A Laboratory Manual"; Ausubel, ed., 1994, "Current Protocols in Molecular Biology" Volumes I-III; Celis, ed., 1994, "Cell Biology: A Laboratory Handbook" Volumes I-III; Coligan, ed., 1994, "Current Protocols in Immunology" Volumes I-III; Gait ed., 1984, "Oligonucleotide Synthesis"; Hames & Higgins eds., 1985, "Nucleic Acid Hybridization"; Hames & Higgins, eds., 1984, "Transcription And Translation"; Freshney, ed., 1986, "Animal Cell Culture"; IRL Press, 1986, "Immobilized Cells And Enzymes"; Perbal, 1984, "A Practical Guide To Molecular Cloning."

Where a range of values is provided, it is understood that each intervening value, to the tenth of the unit of the lower limit unless the context clearly dictates otherwise (such as in the case of a group containing a number of carbon atoms), between the upper and lower limit of that range and any other stated or intervening value in that stated range is encompassed within the invention. The upper and lower limits of these smaller ranges may independently be included in the smaller ranges is also encompassed within the invention, subject to any specifically excluded limit in the stated range. Where the stated range includes one or both of the limits, ranges excluding either both of those included limits are also included in the invention.

Unless defined otherwise, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. Although any methods and materials similar or equivalent to those

described herein can also be used in the practice or testing of the present invention, the preferred methods and materials are now described.

It is to be noted that as used herein and in the appended claims, the singular forms "a," "and" and "the" include plural references unless the context clearly dictates otherwise.

Furthermore, the following terms shall have the definitions set out below. It is understood that in the event a specific term is not defined hereinbelow, that term shall have a meaning within its typical use within context by those of ordinary skill in the art.

The term "compound", as used herein, unless otherwise indicated, refers to any specific chemical compound disclosed herein. Within its use in context, the term generally refers to a single compound comprising a hydrophobic moiety and a linker which is capable of reacting and forming a covalent bond with a fusion protein as otherwise described herein. In certain instances the term may also refer to stereoisomers and/or optical isomers (including racemic mixtures) or enantiomerically enriched mixtures of disclosed compounds. In the present invention in certain instances, especially in preferred aspects of the invention, the compound contains both a hydrophobic moiety and a linker moiety and is chemically linked through a covalent bond to a fusion protein such that the hydrophobic moiety can facilitate and/or produce degradation of the protein of interest which is part of the fusion protein. Compounds which are disclosed are those which are stable and where a choice of substituents and claim elements is available, the substituent or claim element is chosen such that stable compounds are formed from the disclosed elements and substituents.

The term "patient" or "subject" is used throughout the specification within context to describe an animal, generally a mammal and preferably a human, to whom a treatment or procedure, including a prophylactic treatment or procedure is performed. For treatment of those infections, conditions or disease states which are specific for a specific animal such as a human patient, the term patient refers to that specific animal. In most instances, the patient or subject of the present invention is a human patient of either or both genders.

The term "effective" is used herein, unless otherwise indicated, to describe an amount of a compound or composition which, in context, is used to produce or effect an intended

result, whether that result relates to the binding of a hydrophobic moiety-linker compound onto a fusion protein or the use of a chemically modified fusion protein (to which is covalently bonded the hydrophobic group). The term effective subsumes all other effective amount or effective concentration terms which are otherwise described or used in the present application.

The term "protein of interest" is used to describe *inter alia*, intracellular and extracellular proteins which exhibit function in or at the surface of a cell and may be considered drug targets for a disease state or condition. Proteins of interest include structural proteins, receptors, enzymes, cell surface proteins, proteins pertinent to the integrated function of a cell, including proteins involved in catalytic activity, aromatase activity, motor activity, helicase activity, metabolic processes (anabolism and catabolism), antioxidant activity, proteolysis, biosynthesis, proteins with kinase activity, oxidoreductase activity, transferase activity, hydrolase activity, lyase activity, isomerase activity, ligase activity, enzyme regulator activity, signal transducer activity, structural molecule activity, binding activity (protein, lipid carbohydrate), receptor activity, cell motility, membrane fusion, cell communication, regulation of biological processes, development, cell differentiation, response to stimulus, behavioral proteins, cell adhesion proteins, proteins involved in cell death, proteins involved in transport (including protein transporter activity, nuclear transport, ion transporter activity, channel transporter activity, carrier activity, permease activity, secretion activity, electron transporter activity, pathogenesis, chaperone regulator activity, nucleic acid binding activity, transcription regulator activity, extracellular organization and biogenesis activity, translation regulator activity). Proteins of interest can include proteins from eukaryotes and prokaryotes including humans as targets for drug therapy, other animals, including domesticated animals, microbes for the determination of targets for antibiotics and other antimicrobials and plants, and even viruses, among numerous others. The protein of interest is one of the two proteins which comprise the fusion protein of the present invention which protein may be found at the amino terminus or the carboxylic acid terminus of the fusion protein; the other protein being a reporter protein (e.g., a green fluorescent protein, a red fluorescent protein, among others), more preferably a self-labeling tag (e.g., Halotag, Snaptag, Cliptag, ACPtag or MCPtag) as otherwise described herein.

The term “fusion protein” or “chimeric protein” as used herein, describes a protein created through the joining of two or more genes which originally coded for separate, distinct proteins. Translation of the fusion gene results in a single polypeptide (having two polypeptide segments) with functional properties derived from each of the original proteins. Fusion proteins according to the present invention are principally recombinant fusion proteins and are created artificially by recombinant DNA technology. In the present invention, the fusion proteins comprise a protein of interest and a second protein, which may be a reporter protein such as a green or red fluorescent protein or a luciferase protein or preferably, the second protein of the fusion protein is a self-labeling polypeptide tag protein such as a Halotag, Snaptag, Cliptag, ACPTag or MCPtag, as otherwise described herein. It is noted that the protein of interest may be positioned at the amino end or the carboxyl end of the fusion protein and the second protein to which a hydrophobic moiety is linked (e.g. reporter or tag polypeptide) may be positioned accordingly.

Fusion proteins according to the present invention are recombinant fusion proteins, created through engineering of a fusion gene. This typically involves removing the stop codon from a cDNA sequence coding for the first protein, then appending the cDNA sequence of the second protein in frame through ligation or overlap extension PCR, among other techniques. The introduced DNA sequence will then be expressed along with the other DNA sequence by a cell as a single protein. The protein can be engineered to include the full sequence of both original proteins, or only a portion of either. If the two entities are proteins, spacer peptides may be added which make it more likely that the proteins fold independently and behave as expected. In the case where the linkers enable protein purification, spacer peptides in protein or peptide fusions are sometimes engineered with cleavage sites for proteases or chemical agents which enable the liberation of the two separate proteins. Fusion proteins according to the present invention comprise a protein of interest and a second protein to which a hydrophobic tag may be linked. As described, fusion proteins according to the present invention comprise a protein of interest and a second polypeptide which functions to covalently bind a hydrophobic moiety as otherwise described herein. The second protein may be, for example, a reporter polypeptide such as a fluorescent protein or a luciferase protein, but in preferred aspects of the invention, the second protein is a self-labeling polypeptide tag.

Fusion proteins according to the present invention may be created by utilizing commercially available expression vectors which can be used to prepare fusion genes which are created by inserting an appropriate DNA sequence into the expression vector which is introduced into an expression cell, such as yeast or a bacterial cell in order to express the fusion protein. The present invention preferably utilizes fusion proteins which express a self-labeling polypeptide tag as otherwise described herein in addition to the protein of interest in order to link the hydrophobic moiety to the fusion protein.

The term "self-labeling polypeptide tag" or "self-labeling tag" is used to describe a polypeptide tag which is used in preferred fusion proteins according to the present invention as a means to covalently link a hydrophobic moiety to a protein of interest through a linker which is reactive with the self-labeling tag. The self-labeling tag comprises an enzyme (often mutated) which can be inserted into a fusion protein and is reactive with a specific moiety in order to covalently bind a linker (which contains the specific moiety on one end and a hydrophobic moiety on the other end) to the self-labeling tag and consequently, a hydrophobic moiety to the fusion protein. Preferred self-labeling tags include, for example, halotag, snaptag, cliptag, ACPTag and MCPtag self-labeling tags. All of these tags are readily available in commercially available expression vectors from Promega Corporation of Madison, Wisconsin (halotag) and New England BioLabs, Inc. of Ipswich, Massachusetts, which vectors can accommodate the splicing of a gene for a protein of interest into the expression vector in order to produce the fusion protein comprising a protein of interest and a self-labeling polypeptide tag.

The halotag self-labeling polypeptide tag is based upon the halotag protein, a 34kDa mutated bacterial hydrolase (haloalkane dehalogenase) which has been incorporated into expression vectors by Promega corporation, which are available commercially. For example, the halotag2 self-labeling tag (haloalkane dehalogenase) sequence SEQ ID NO: 1 (see figure 16) may be found at GenBank® Acc. #. AAV70825 and the expression vector at AY773970. The halotag7 polypeptide is SEQ ID NO:2 (figure 16). Halotag is reactive with haloalkanes and when expressed in fusion protein form, creates a covalent bond between the fusion protein and a reactive linker group onto which has been further linked a reporter moiety or, in the present application, a hydrophobic moiety (other than a fluorophore). Although a number of haloalkane groups may be used as the reactive linker in the halotag system in order to create a covalent bond, the preferred reactive linker is a

group. The halotag is readily available in commercially available expression vectors from Promega Corporation of Madison, Wisconsin (halotag). These vectors can accommodate the splicing of a gene for a protein of interest into the expression vector in order to produce the fusion protein comprising a protein of interest and a self-labeling polypeptide tag, expressed in *E. coli* as well as other expression vectors.

The snaptag self-labeling polypeptide tag is based upon a 20 kDa mutant of the DNA repair protein O⁶-alkylguanine-DNA alkyltransferase that reacts specifically and rapidly with benzylguanine (BG) derivatives as otherwise described herein, leading to irreversible covalent labeling of the snaptag with a synthetic hydrophobic moiety containing probe through a sulfur group residing on the snaptag and the benzyl group of the benzylguanine synthetic probe. The rate of the reaction of snaptag with BG derivatives is to a large extent independent of the nature of the synthetic probe attached to BG and permits the labeling of snap fusion proteins with a wide variety of synthetic probes. Expression vectors for incorporating snaptag into numerous fusion proteins (e.g. psnap-tag(m), psnap-tag(m)2, psnap-tag(T7) and psnap-tag (T7)-2 Vector) are available from New England Biolabs, Inc., USA. The polypeptide sequences for each of the snaptag polypeptides (snaptagm, snaptagm2, snaptagT7 and snaptagT7-2) are found in figure 16 as psnap-tag(m) (SEQ ID NO:3), psnap-tag(m)2 (SEQ ID NO:4), psnap-tag(T7) (SEQ ID NO:5) and psnap-tag (T7)-2 (SEQ ID NO:6).

The cliptag self-labeling polypeptide tag is based upon a mutation of the snaptag DNA alkyltransferase enzyme, resulting in differential substrate specificity. In the case of cliptag protein, this protein reacts specifically with O2-benzylcytosine (BC) derivatives forming a covalent bond between a synthetic probe which is attached to O2-benzylcytosine and the cliptag through a sulfur group on the cliptag and the benzyl group on the benzylcytosine derivatives. The SNAP- and CLIP-tag fusion proteins can be labeled simultaneously and specifically with different synthetic probes in living cells. Expression vectors for incorporating cliptag into numerous fusion proteins (e.g. clip-tag(m) vector is available from New England Biolabs, Inc., USA). The polypeptide sequence for the cliptag polypeptide (cliptagm) is found in figure 16 as pclip-tag(m) (SEQ ID NO:7).

The use of ACP and MCP tags are somewhat different from the labeling of snap and clip fusion proteins, as the ACP and MCP tags are based on an enzyme-catalyzed post-translational modification. In this approach, the protein of interest is fused to an acyl carrier protein (ACP) and the corresponding fusion protein is specifically labeled with CoA derivatives through a post-translational modification catalyzed by the phosphopantetheinyl transferase AcpS (SCP synthase). The ACPTag is of a small size of 9 kDa. The MCPtag, which is a mutant of the ACP tag of similar size is labeled by the phosphopantetheinyl transferase Sfp (Sfp synthase) but not by ACP synthase, thereby permitting the selective labeling of ACP and MCP fusion proteins with different probes in one sample. In contrast to substrates of the halotag, snaptag and cliptag, substrates of the ACPTag (ACPTagm and ACPTagm-2) and MCPtag (MCPtagm) are not cell permeable, although this approach may be readily utilized where the protein of interest is a cell surface protein. Expression vectors for these tags (pACP-tag(m), pACP-tag(m)-2 and pMCP-tag(m)) are available from New England Biolabs, Inc., Massachusetts, USA. These expression vectors may be used to readily accommodate many proteins of interest to provide an assortment of fusion proteins to determine the functionality and importance of a protein of interest in methods according to the present invention. These vectors can accommodate the splicing of a gene for a protein of interest into the expression vector in order to produce the fusion protein comprising a protein of interest and a self-labeling polypeptide tag, expressed in *E. coli* as well as other expression vectors. The polypeptide sequences for each of the ACPTag and MCPtag polypeptides is found in figure 16 as pACP-tag(m) (SEQ ID NO:8), pACP-tag(m)-2 (SEQ ID NO:9) and pMCP-tag(m) (SEQ ID NO:10).

The preferred self-labeling tags for use in the present invention, halotag, snaptag, cliptag, ACPTag and MCPtag can be used to selectively label corresponding fusion proteins with synthetic probes containing hydrophobic moieties as described herein in both cell assay and *in vitro* applications.

The term "hydrophobic group" or "hydrophobic moiety" is used to describe a hydrophobic group which is covalently linked to a fusion protein according to the present invention which destabilizes and degrades a protein of interest in the fusion protein such that the fusion protein becomes degraded in a cell (proteasomal degradation). In the present invention, the hydrophobic group has the following physicochemical characteristics, in

particular, as represented by having a ClogP value of at least about 1.5, at least about 1.75, at least about 2.0, at least about 2.25, at least about 2.5, at least about 2.75, at least about 3.0, at least about 3.25, at least about 3.5, at least about 3.75, at least about 4.0, at least about 4.25, at least about 4.5, at least about 4.75, at least about 5.0, at least about 5.25, at least about 5.5.

ClogP is a value which may be readily calculated using ClogP software, available from Biobyte, Inc., Claremont, California, USA and applied to any computer which utilizes Windows, linux or an Apple operating system. ClogP software is readily adaptable to a number of chemical programs including ChemDraw programs and related chemical structure drawing programs. The value ClogP assigns to the hydrophobicity of a chemical or moiety is based upon a determination of log P n-octanol/water ($\log P_{OW}$), which is the log of the partition coefficient of a molecule or moiety in octanol and water. ClogP accurately estimates $\log P_{OW}$ numbers and provides a readout of a value which may be readily applied to the present invention. Newer versions of ChemDraw software, available from CambridgeSoft, Inc., Cambridge Massachusetts, USA. incorporate the ability to interface with ClogP software and provide ClogP calculations, which may readily accomplished by simply drawing a molecule and applying the ClogP calculation app from that software to the hydrophobic molecule or moiety to be utilized. Thus, according to the present invention, virtually any hydrophobic moiety may be proposed and chemically synthesized and incorporated into a reactive linker with the expectation that that moiety when incorporated into a fusion protein as otherwise disclosed herein, will produce degradation of the fusion protein (containing a protein of interest) consistent with the method of the present invention.

In the present invention, virtually any hydrophobic group having a calculated ClogP value of at least about 1.5 (as otherwise disclosed hereinabove) may be used to facilitate the degradation of the protein of interest in the fusion protein. Representative hydrophobic groups include optionally substituted hydrocarbyl groups containing at least three carbon atoms, such as optionally substituted C_3 - C_{30} alkyl, alkene or alkyne groups, including linear, branch-chained or cyclic (including bi-cyclo, adamantyl and fused ring groups) hydrocarbon groups, aryl groups, including aryl groups containing a single ring or 2 or more fused rings (e.g., two, three or four fused rings) such as optionally substituted phenyl groups, including optionally substituted naphthyl groups (including 1- or 2-naphthyl groups), optionally substituted anthracenyl, phenanthrenyl, and phenacenyl (chrysene) groups, optionally

substituted triphenyl methyl (trityl, methoxytrityl) groups, optionally substituted hydrophobic heterocyclic, including heteroaryl groups such as optionally substituted quinolinyl groups, among others. Representative hydrophobic groups are found in the chemical compounds which are presented in attached Figs. 5 and 14 respectively. One of ordinary skill in the art may readily adapt ClogP software, combined with a structural chemical program (e.g. ChemDraw) to readily provide hydrophobic moieties useful in the present invention. In addition, the person of ordinary skill may modify numerous moieties with hydrophobic moieties to increase the hydrophobicity of the moiety to provide a ClogP value significantly greater than 1.5. It is noted that in certain instances, useful hydrophobic moieties may have values of ClogP less than 1.5, but those moieties contain substantial steric bulk which compensates for the low levels of hydrophobicity. The inclusion of a borane nido-decaborane group ($B_{10}H_{14}$) substituent on an aryl group such as a phenyl, naphthyl, phenanthrenyl, anthracenyl (paranaphthyl), etc.

The term "hydrocarbon" or "hydrocarbyl" refers to any monovalent radical containing carbon and hydrogen, which may be straight, branch-chained or cyclic in nature. Hydrocarbons include linear, branched and cyclic hydrocarbons, including alkyl groups, alkylene groups, saturated and unsaturated hydrocarbon groups (e.g., alkene, alkyne), including aromatic groups both substituted and unsubstituted.

"Alkyl" refers to a fully saturated monovalent radical containing carbon and hydrogen, and which may be cyclic, branched or a straight chain containing from 1 to 30 carbon atoms, from 1 to 20 carbon atoms, preferably 1 to 10 carbon atoms. Examples of alkyl groups are methyl, ethyl, n-butyl, n-hexyl, n-heptyl, n-octyl, isopropyl, 2-methylpropyl, cyclopropyl, cyclopropylmethyl, cyclobutyl, cyclopentyl, cyclopentylethyl, cyclohexylethyl and cyclohexyl. Preferred alkyl groups are C_1-C_6 or C_3-C_{10} alkyl groups. "Alkylene" refers to a fully saturated hydrocarbon which is divalent (may be linear, branched or cyclic) and which is optionally substituted. Other terms used to indicate substituent groups in compounds according to the present invention are as conventionally used in the art.

"Aryl" or "aromatic", in context, refers to a substituted or unsubstituted monovalent aromatic radical having a single ring (e.g., benzene) or multiple condensed rings (e.g., naphthyl, anthracenyl, phenanthryl, phenacenyl) and can be bound to the compound

according to the present invention at any position on the ring(s). Other examples of aryl groups, in context, may include heterocyclic aromatic ring systems "heteroaryl" groups having one or more nitrogen, oxygen, or sulfur atoms in the ring (monocyclic) such as imidazole, furyl, pyrrole, pyridyl, furanyl, thiene, thiazole, pyridine, pyrimidine, pyrazine, triazole, oxazole, indole or preferably fused ring systems (bicyclic, tricyclic), among others, which may be substituted or unsubstituted as otherwise described herein. Preferred heteroaryl groups are hydrophobic in nature or can be rendered hydrophobic by including one or more hydrophobic substituents on the heteroaryl group, or creating a fused system where at least one of the rings is a benzene (phenyl) ring.

The term "cyclic" shall refer to an optionally substituted carbocyclic or heterocyclic group, preferably a 5- or 6-membered ring or fused rings (two, three or four rings) preferably containing from 8 to 14 atoms. A heterocyclic ring or group shall contain at least one monocyclic ring containing between 3 and 7 atoms of which up to four of those atoms are other than carbon and are selected from nitrogen, sulfur and oxygen. Carbocyclic and heterocyclic rings according to the present invention may be unsaturated or saturated. Preferred cyclic groups are hydrocarbyl groups, preferably unsaturated hydrocarbyl groups which are optionally substituted. Other preferred cyclic groups are bicyclo alkyl groups or adamantyl groups, each of which may be optionally substituted. Preferred heterocyclic groups are heteroaryl or heteroaromatic.

The term "heterocyclic group" as used throughout the present specification refers to an aromatic ("heteroaryl") or non-aromatic cyclic group forming the cyclic ring(s) and including at least one hetero atom such as nitrogen, sulfur or oxygen among the atoms forming the cyclic ring. The heterocyclic ring may be saturated (heterocyclic) or unsaturated (heteroaryl). Exemplary heterocyclic groups include, for example pyrrolidinyl, piperidinyl, morpholinyl, pyrrole, pyridine, pyridone, pyrimidine, imidazole, indole, quinoline, isoquinoline, quinolizine, phthalazine, naphthyridine, quinazoline, cinnoline, acridine, phenacene, thiophene, benzothiophene, furan, pyran, benzofuran, thiazole, benzothiazole, phenothiazine and carbostyryl, more preferably pyrrolidinyl, piperidinyl, morpholinyl, pyrrole, pyridine, thiophene, benzothiophene, thiazole, benzothiazole, quinoline, quinazoline, cinnoline and carbostyryl, and even more preferably thiazole, quinoline, quinazoline,

cinnoline, carbostyryl, piperazinyl, N-methylpiperazinyl, tetrahydropyranyl, 1,4-dioxane and phthalimide, among others.

Exemplary heteroaryl moieties which may be used in the present invention include for example, pyrrole, pyridine, pyridone, pyridazine, pyrimidine, pyrazine, pyrazole, imidazole, triazole, tetrazole, indole, isoindole, indolizine, purine, indazole, quinoline, isoquinoline, quinolizine, phthalazine, naphthyridine, quinoxaline, quinazoline, cinnoline, pteridine, imidazopyridine, imidazotriazine, pyrazinopyridazine, acridine, phenanthridine, carbazole, carbazoline, perimidine, phenanthroline, phenacene, oxadiazole, benzimidazole, pyrrolopyridine, pyrrolopyrimidine and pyridopyrimidine; sulfur-containing aromatic heterocycles such as thiophene and benzothiophene; oxygen-containing aromatic heterocycles such as furan, pyran, cyclopentapyran, benzofuran and isobenzofuran; and especially aromatic heterocycles comprising 2 or more hetero atoms selected from among nitrogen, sulfur and oxygen, such as thiazole, thiadiazole, isothiazole, benzoxazole, benzothiazole, benzothiadiazole, phenothiazine, isoxazole, furazan, phenoxazine, pyrazoloxazole, imidazothiazole, thienofuran, furopyrrole, pyridoxazine, furopyridine, furopyrimidine, thienopyrimidine and oxazole. Further heteroaryl groups may include pyridine, triazine, pyridone, pyrimidine, imidazole, indole, quinoline, isoquinoline, quinolizine, phthalazine, naphthyridine, quinazoline, cinnoline, acridine, phenacene, thiophene, benzothiophene, furan, pyran, benzofuran, thiazole, benzthiazole, phenothiazine, pyrrolopyrimidine, furopyridine, furopyrimidine and thienopyrimidine, preferably benzothiophene, benzothiazole, quinoline, quinazoline, cinnoline, pyrrolopyrimidine, furopyridine and thienopyrimidine.

The term "substituted" shall mean substituted at a carbon (or nitrogen) position within context, hydroxyl, carboxyl, cyano ($C\equiv N$), nitro (NO_2), halogen (preferably, 1, 2 or 3 halogens, especially on an alkyl, especially a methyl group such as a trifluoromethyl), thiol, alkyl group (preferably, C_1 - C_{10} , more preferably, C_1 - C_6), alkoxy group (preferably, C_1 - C_{10} alkyl or aryl, including phenyl and substituted phenyl), ester (preferably, C_1 - C_{10} alkyl or aryl) including alkylene ester (such that attachment is on the alkylene group, rather than at the ester function which is preferably substituted with a C_1 - C_{10} alkyl or aryl group), thioether (preferably, C_1 - C_{10} alkyl or aryl), thioester (preferably, C_1 - C_{10} alkyl or aryl), (preferably, C_1 - C_{10} alkyl or aryl), halogen (F, Cl, Br, I), nitro or amine (including a five- or six-membered cyclic alkylene amine, further including a C_1 - C_{10} alkyl amine or C_1 - C_{10} dialkyl amine),

amido, which is preferably substituted with one or two C₁-C₁₀ alkyl groups (including a carboxamide which is substituted with one or two C₁-C₁₀ alkyl groups), alkanol (preferably, C₁-C₁₀ alkyl or aryl), or alkanolic acid (preferably, C₁-C₁₀ alkyl or aryl). Preferably, the term “substituted” shall mean within its context of use alkyl, alkoxy, halogen, ester, keto, nitro, cyano and amine (especially including mono- or di- C₁-C₁₀ alkyl substituted amines). Any substitutable position in a compound according to the present invention may be substituted in the present invention, but preferably no more than 5, more preferably no more than 3 substituents are present on a single ring or ring system. Preferably, the term “unsubstituted” shall mean substituted with one or more H atoms. Preferred substituents are those which have hydrophobic characteristics as otherwise described herein. It is noted that the incorporation of a hydrophobic substituent onto an otherwise less hydrophobic or non-hydrophobic moiety may render the entire moiety hydrophobic as described for the present invention. A preferred substituent on aryl groups (e.g., phenyl, naphthyl) for use in the present invention is the borane nido-decaborane group (B₁₀H₁₄), which although is not a hydrophobic group *per se*, provides the favorable characteristics of a significant steric effect to enhance degradation of fusion proteins in the present invention.

The term “linker” is used to describe a chemical group which covalently links the hydrophobic moiety to the fusion protein in preferred aspects of the present invention. In particular, the linker binds to the hydrophobic moiety at one end and to the fusion protein at the other end. In its broadest aspects, the linker may link the hydrophobic moiety to the fusion protein using conventional chemistry, by reacting (condensing) a nucleophilic group on the fusion protein (an amine, sulfhydryl or hydroxyl group) with an electrophilic group (carboxylic acid, etc.) on the linker to which the hydrophobic groups is attached, thus providing a compound which links the hydrophobic moiety to the fusion protein via the linker. In certain preferred embodiments, the linker binds to a self-labeling tag of the fusion protein by the action of the self-labeling tag on a reactive portion of the linker (“reactive linker”), depending upon the type of self-labeling tag. The chemistry associated with the various linkers according to the present invention will be a function of the fusion protein to which the hydrophobic moiety is to be linked, especially in the case where the fusion protein comprises a self-labeling protein tag (halotag, etc. as otherwise disclosed herein), in which case the chemistry of the linker will reflect the substrate specificity of the self-labeling protein tag. Because the reactive moiety of the linker is specific to the self-labeling tag used

in the fusion protein of the present invention, the chemistry of the linker at that (reactive end) end which covalently binds to the fusion protein will be a function of the substrate specificity for that self-labeling tag protein. Thus, the reactive moiety of the linker is specific as a substrate for the self-labeling tag of the fusion protein, wherein the self-labeling tag is preferably a HALOtag, a SNAPtag, a CLIPtag, a ACPTag or a MCPtag, all well-known in the art.

Preferably, the self-labeling tag is a HALOtag, in particular a haloalkane group (preferably a C₂-C₁₂ chloralkyl, even more preferably, a haloalkyl diether group, in preferred aspects a group according to the chemical structure:

In the case of where the fusion protein comprises a self-labeling tag as a SNAPtag, Y_R is a benzylguanine group which forms a compound according to the chemical structure:

Where , Z and X are as otherwise described above.

In the case where the fusion protein comprises a self-labeling tag as a CLIPtag, Y_R is a benzylcytosine group which forms a compound according to the chemical structure:

Where , Z and X are as otherwise described above.

In the case where the fusion protein comprises a self-labeling tag as a ACPtag or a MCPtag, Y_R is a coenzyme A derivative which forms a compound according to the chemical structure:

Where , Z and X are as otherwise described above.

The term “connector”, symbolized in compounds according to the present invention by the symbol [CON], is used to describe a chemical moiety which is optionally included in compounds according to the present invention in linker groups as otherwise described herein.

The connector group is the resulting moiety which forms from the facile condensation of two separate chemical fragments which contain reactive groups which can provide connector groups as otherwise described to produce linker groups which covalent link hydrophobic moieties to fusion proteins in compounds according to the present invention. It is noted that a connector is distinguishable from a linker in that the connector is the result of a specific chemistry which is used to provide compounds according to the present invention wherein the reaction product of these groups results in an identifiable connector group which forms a linker group of greater length as otherwise described herein.

Common connector groups which are used in the present invention include the following chemical groups:

Where X^2 is O, S, NR^4 , $S(O)$, $S(O)_2$, $-S(O)_2O$, $-OS(O)_2$, or $OS(O)_2O$;

X^3 is O, S, NR^4 ; and

R^4 is H or a C_1 - C_3 alkyl group.

Compounds according to the present invention are readily synthesized using methods well known in the art. In the present invention, a preferred approach to providing a reactive linker with a hydrophobic moiety covalently linked to same follows well established synthetic chemical methods. A hydrophobic moiety may be derivatized and a convenient approach is to provide a hydrophobic moiety which contains a carboxylic acid or other

electrophilic functional group to react with a nucleophilic (e.g. amine, hydroxyl or sulfhydryl) group on a linker molecule to provide a hydrophobic moiety-containing linker. The hydrophobic linker may contain a reactive moiety to covalently bond the linker to a fusion protein or the hydrophobic linker may be derivatized to provide a functional group (e.g., a nucleophilic or electrophilic moiety) which is capable of reacting with the fusion protein. In the case of the use of a self-labeling polypeptide tag to covalently link the hydrophobic moiety to the fusion protein, the hydrophobic containing linker is derivatized to contain (preferably, at the distal end away from the hydrophobic moiety) a chemical moiety which acted upon by the self-labeling tag (e.g., halo, snap, clip, ACP or MCP) as otherwise described herein. The formation of the function groups which are reactive with the self-labeling tag is well known and readily provided using chemical synthetic technicals which are well known in the art. In the case of the halotag, the formation of a haloalkane, in particularly preferred aspects of the present invention, a chloroalkyldiether moiety as otherwise described herein is readily accomplished from commercially available intermediates. Particular synthetic approaches are provided in the examples section which follows. In the case of the benzyl guanosine and benzyl cytosine linker analog substrates of snaptag and cliptag self-labeling tags, these are readily provided from reactive linkers which are end-capped with benzyl guanosine and benzyl cytosine respectively.

Once the reactive linker comprising a hydrophobic moiety is provided, reaction with the fusion protein commences to covalently link the hydrophobic moiety to the fusion protein. The reactive linker may be covalently linked to the fusion protein outside of the cell via standard chemical reaction, but preferably is linked via the self-labeling tag *intracellularly*. The reactive linker and fusion protein may be reacted intracellularly, separate and then utilized in an assay to determine the function and importance of the protein of interest in the fusion protein as a potential target, or alternatively, the fusion protein and reactive linker may be introduced *intracellularly* within the same cell in which the assay for function and importance takes place. The compounds according to the present invention may be utilized *in vitro* or *in vivo*, and may be used in cell-based assays and in animals models, given that the relatively low toxicity of many of the the compounds is consistent with *in vivo* utilization.

The compounds according to the present invention may be used in cell based assays to determine the function and importance of a protein of interest, by assaying cell function as a

consequence of the degradation of the fusion protein to which the hydrophobic moiety is covalently bonded. These assays may be based upon prokaryote and/or eukaryote cells and may be directed to animal and plant proteins, as well as microbial proteins, such as fungal and bacterial proteins, as well as viral proteins. Degradation of the fusion protein containing the protein of interest may be indicative of the importance of the protein of interest to an important function which modulates a disease state or condition, for example, the growth of cancer cells, an inflammatory response or other biological response, or the proliferation of bacteria and/or viruses. Degradation of the fusion protein under assay conditions may be readily monitored using one of the many standard techniques available in the art, including immunoblot, immunoassay (e.g. ELISA, among others), absorbance assays, mass spectrometric methods and proteomics methods, among others. Virtually any technique for measuring proteins may be adapted for use in the present method provided it is otherwise consistent with the integrity of the assay performed using compounds according to the present invention.

Elucidating the *in vivo* function of protein function for drug target validation is a stumbling block in drug development, which may be readily addressed using the present invention hydrophobic tagging methodology. For example, many G Protein-Coupled Receptors (GPCRs) GPCRs lack a known ligand or function. One could introduce the HaloTag gene into the mouse genome such that the knock-in transgene encodes a halotag fusion protein fused to a protein of interest, e.g., an orphan GCPR. Administration of a hydrophobic tagged reactive linker to animals expressing the fusion protein would induce the degradation of the fusion protein (by facilitating the covalent linking of the hydrophobic moiety containing reactive linker to the fusion protein) and the resulting phenotypic response would mimic the effect of a drug (e.g., as an inhibitor of the protein of interest), thus validating the GPCR (or any other protein) as a drug target.

Another example of the temporal control advantage offered by the present invention is in the area of parasite drug target validation. It is difficult to determine the functional consequence of inhibiting certain parasite proteins due to their complex life cycles, i.e., a protein might be needed at two stages, an early one in an animal vector and a latter one in humans. It would be desirable to retain protein function during the early stage but then to be able to eliminate it at the later stage so as to mimic the effects of a human drug against this parasite. By replacing the gene for a particular parasite protein with a self-labeling tag

(e.g., halotag) fused with a candidate gene (producing a protein of interest) and then inducing the degradation of this expressed fusion protein using the hydrophobic tagging methodology, one will be able to validate the candidate parasite protein as a drug target.

The present invention will now be further described by way of the following examples, the description of which should be taken to merely exemplify, but not limit, the present invention.

Examples

Overview

To develop a general method to degrade any intracellular protein using a small molecule, we sought to enlist the cellular protein quality control machinery. The burial of internal hydrophobic residues within a protein's core is a major driving force behind protein folding, and, correspondingly, exposure of such hydrophobic regions is considered a hallmark of an unfolded protein²¹⁻²³. For instance, the endoplasmic reticulum Hsp70-class chaperone BiP specifically binds hydrophobic amino acids and helps slow-folding proteins to fold^{22,24}. Should the cell fail to fold the target protein correctly, the unfolded protein is eliminated by either the ubiquitin-proteasome system or autophagy²⁵. We sought to mimic the partially denatured state of a protein by appending a hydrophobic tag on its surface in order to induce its degradation. To test this hypothesis, we selected the HaloTag dehalogenase system developed by Promega as the fusion protein component²⁶. This system was chosen because HaloTag fusion proteins are commercially available in various formats and the haloalkane reactive linker binds to the HaloTag domain covalently, suggesting a high specificity of the ligand for HaloTag. Here, we demonstrate that hydrophobic tagging affords rapid and robust control of the abundance of numerous proteins, including transmembrane receptors, in cultured cells as well as in zebrafish and mouse models.

Chemical Synthesis

Materials, Purification, and Analysis.

Reagents used for chemical synthesis were purchased from Sigma-Aldrich Co. and were used without further purification. All reactions were performed in oven-dried or flame-dried glassware fitted with rubber septa under a positive pressure of nitrogen. THF was distilled from sodium/benzophenone. Dichloromethane was distilled from calcium hydride. Analytical thin layer chromatography (TLC) was performed using glass plates precoated with silica gel (0.25 mm). TLC plates were visualized by exposure to UV light (UV), and then were stained by submersion into aqueous ceric ammonium molybdate (CAM) or ethanolic ninhydrin solution (Ninhydrin) followed by brief heating on hot plate. Flash column chromatography was performed using silica gel 60 (230-400 mesh, Merck) with the indicated solvents.

^1H and ^{13}C spectra were recorded on Bruker Avance DPX-500 or Bruker Avance DPX-400 NMR spectrometers. ^1H NMR spectra are represented as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, br = broad), integration, and coupling constant (J) in Hertz (Hz). ^1H NMR chemical shifts are reported relative to CDCl_3 (7.26 ppm) and $\text{d}_4\text{-MeOD}$ (3.30 ppm). ^{13}C NMR was recorded relative to the central line of CDCl_3 (77.00 ppm) and $\text{d}_4\text{-MeOD}$ (49.00 ppm). High resolution mass spectra were measured at the Keck Biotechnology Resource Laboratory of Yale University. Low resolution mass spectra were acquired on a Waters Micromass ZQ mass spectrometer or a Perkin-Elmer API 150 EX LCMS spectrometer.

Synthetic Experimental Procedures and Characterization Data

Compounds (2, 3, 4, 5, 6) and Control Compound (1).

Scheme 1. General Synthetic Scheme for Hydrophobic Tags (Halotag)

Scheme 2. Synthesis of HyT13 (3)

tert-Butyl (2-(2-hydroxyethoxy)ethyl)carbamate (9): To a solution of 2-(2-aminoethoxy)ethanol (2.1 g, 20 mmol) in C₂H₅OH (50 mL) at 0 °C was added Boc₂O (4.36 g, 20 mmol). The reaction mixture was stirred at rt for 5 h, evaporated, and diluted with CH₂Cl₂ (20 mL) and H₂O (20 mL). The mixture was extracted twice with CH₂Cl₂, and the combined extracts were washed with brine, dried over Na₂SO₄, filtered, and concentrated. The residue was chromatographed on silica gel to furnish *tert*-butyl (2-(2-hydroxyethoxy)ethyl)carbamate **9** (4.09 g, quant.). ¹H NMR (400 MHz, CDCl₃) δ 5.01 (brs, 1H), 3.76-3.72 (m, 2H), 3.58-3.54 (m, 4H), 3.35-3.32 (m, 2H), 2.39 (t, *J* = 5.9 Hz, 1H), 1.44 (s, 9H). ¹³C NMR (100 MHz, CDCl₃) δ 156.1, 79.3, 72.1, 70.3, 61.7, 40.3, 28.7. LRMS (ES+) [M+Na]⁺ 228.4. TLC (33% EtOAc in hexanes), R_f 0.08 (Ninhydrin).

tert-Butyl (2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)carbamate (11): To a solution of *tert*-butyl (2-(2-hydroxyethoxy)ethyl)carbamate **9** (2.15 g, 10.48 mmol) in THF (20 mL) and DMF (10 mL) at 0 °C added portionwise NaH (60% dispersion in mineral oil, 560 mg, 14.04 mmol). After stirring at 0 °C for 0.5 h, 6-chloro-1-iodohexane **10** (Sigma-Aldrich, 2.4 mL, 15.72 mmol) was added to the mixture at 0 °C. The reaction mixture was stirred at 0 °C for 20 min, at rt for 14 h, and quenched at 0 °C with saturated NH₄Cl solution in H₂O. The mixture was extracted twice with ethyl acetate and the combined extracts were washed with brine, dried over Na₂SO₄, filtered, and concentrated. The residue was chromatographed on silica gel to afford *tert*-butyl (2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl) carbamate **11** (2.4 g, 71%). ¹H

NMR (400 MHz, CDCl₃) δ 4.98 (brs, 1H), 3.61-3.51 (m, 8H), 3.46 (t, J = 6.7 Hz, 2H), 3.31 (t, J = 4.7 Hz, 2H), 1.81-1.74 (m, 2H), 1.61-1.57 (m, 2H), 1.49-1.33 (m, 4H), 1.43 (s, 9H). ¹³C NMR (125 MHz, CDCl₃) δ 155.9, 79.2, 71.2, 70.3, 70.2, 70.0, 45.0, 32.5, 29.4, 28.4, 26.7, 25.4. LRMS (ES+) [M+Na]⁺ 346.3. TLC (33% EtOAc in hexanes), R_f 0.36 (Ninhydrin).

2-(2-((6-Chlorohexyl)oxy)ethoxy)ethanamine (8): To a solution of *tert*-butyl 2-(2-((6-chlorohexyl)oxy)ethoxy)ethylcarbamate **11** (1.348 g, 4.171 mmol) in CH₂Cl₂ (30 mL) at 0 °C were added TFA (5 mL). After stirring at 0 °C for 2.5 h, TFA and solvent were removed in vacuo and the residue was diluted with MeOH (30 mL). The solution was cooled to 5 °C and K₂CO₃ (1.65 g, 11.929 mmol) was added to the mixture. The mixture was stirred at the same temperature for 10 min, filtered, and evaporated. The residue was diluted with H₂O (20 mL) and the mixture was extracted four times with ethyl acetate. The combined extracts were dried over Na₂SO₄, filtered, and concentrated. The crude amine was purified by flash column chromatography on silica gel to give 2-(2-((6-chlorohexyl)oxy)ethoxy)ethanamine **8** (867 mg, 93%). ¹H NMR (400 MHz, CDCl₃) δ 6.47 (brs, 1H), 3.69 (t, J = 4.9 Hz, 2H), 3.63-3.60 (m, 2H), 3.56-3.53 (m, 2H), 3.52 (t, J = 6.6 Hz, 2H), 3.44 (t, J = 6.8 Hz, 2H), 3.12 (t, J = 4.9 Hz, 2H), 1.79-1.71 (m, 2H), 1.60-1.53 (m, 2H), 1.46-1.39 (m, 2H), 1.36-1.28 (m, 2H). ¹³C NMR (100 MHz, CDCl₃) δ 71.1, 70.1, 69.7, 45.0, 39.4, 32.4, 29.1, 26.5, 25.1. LRMS (ES+) [M+H]⁺ 223.8, [M+Na]⁺ 246.1. TLC (10% CH₃OH in EtOAc), R_f 0.08 (CAM).

2-((3*r*,5*r*,7*r*)-Adamantan-1-yl)-N-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)acetamide (HyT13, **3**): To a solution of 1-adamantaneacetic acid **12** (Sigma-Aldrich, 19.5 mg, 0.10 mmol, 1.0 equiv.) and 2-(2-((6-chlorohexyl)oxy)ethoxy)ethanamine **8** (23 mg, 0.10 mmol, 1.0 equiv.) in CH₂Cl₂ (1.5 mL) at rt were added HOBT (16 mg, 0.12 mmol, 1.2 equiv.) and DIEA (52 μ L, 3.0 equiv.). The reaction mixture was cooled to 0 °C and EDCI (23 mg, 0.12 mmol, 1.2 equiv.) was added to the mixture. The resulting mixture was stirred at rt for 20 h and quenched at 0 °C with H₂O (5 mL). The mixture was extracted twice with ethyl acetate and the combined extracts were washed with brine, dried over Na₂SO₄, filtered, and concentrated. The residue was chromatographed on silica gel to afford **3** (HyT13, 38 mg, 96%). ¹H NMR (400 MHz, CDCl₃) δ 5.89 (brs, 1H), 3.61-3.59 (m, 2H), 3.57-3.50 (m, 6H), 3.47-3.42 (m, 4H), 1.95 (s, 2H), 1.92 (s, 2H), 1.80-1.73 (m, 2H), 1.70-1.56 (m, 13H), 1.48-1.41 (m, 2H), 1.40-1.33 (m, 2H). ¹³C NMR (100 MHz, CDCl₃) δ 170.9, 71.2, 70.2, 69.9, 51.7, 45.0, 42.5, 38.9,

36.7, 32.7, 32.4, 29.4, 28.6, 26.6, 25.3. HRMS (ES⁺) calculated for C₂₂H₃₈N₈ClNO₃ [M+H]⁺ 400.2613, found 400.2609. TLC (5% CH₃OH in CH₂Cl₂), R_f 0.29 (CAM).

N-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)-2,2-diphenylacetamide (HyT12, 2):

HyT12 was synthesized by the same methods as HyT13 (3).

¹H NMR (400 MHz, CDCl₃) δ 7.35-7.24 (m, 10H), 6.15 (s, 1H), 4.91 (s, 1H), 3.56-3.47 (m, 10H), 3.42 (t, *J* = 6.7 Hz, 2H), 1.80-1.73 (m, 2H), 1.62-1.55 (m, 2H), 1.48-1.41 (m, 2H), 1.39-1.31 (m, 2H). ¹³C NMR (100 MHz, CDCl₃) δ 171.8, 139.4, 128.8, 128.6, 127.1, 71.2, 70.2, 69.9, 69.6, 59.1, 45.0, 39.4, 32.4, 29.4, 26.6, 25.3. LRMS (ES⁺) [M+H]⁺ 418.4. TLC (5% CH₃OH in CH₂Cl₂), R_f 0.33 (UV, CAM).

N-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)-2-(9*H*-fluoren-9-yl)acetamide (HyT16, 4):

HyT16 was synthesized by the same methods as HyT13 (3).

^1H NMR (400 MHz, CDCl_3) δ 7.75 (d, $J = 7.5$ Hz, 2H), 7.50 (d, $J = 7.4$ Hz, 2H), 7.38 (d, $J = 7.4$ Hz, 1H), 7.36 (d, $J = 7.4$ Hz, 1H), 7.29 (dd, $J = 7.4, 1.0$ Hz, 1H), 7.28 (dd, $J = 7.4, 1.0$ Hz, 1H), 6.0 (brs, 1H), 4.52 (t, $J = 7.4$ Hz, 1H), 3.59-3.53 (m, 6H), 3.51-3.49 (m, 2H), 3.47 (t, $J = 6.7$ Hz, 2H), 3.36 (t, $J = 6.7$ Hz, 2H), 2.59 (d, $J = 7.4$ Hz, 2H), 1.72-1.65 (m, 2H), 1.52-1.45 (m, 2H), 1.39-1.32 (m, 2H), 1.30-1.24 (m, 2H). ^{13}C NMR (100 MHz, CDCl_3) δ 171.2, 146.4, 140.6, 127.3, 127.0, 124.5, 119.8, 71.1, 70.2, 69.8, 69.6, 45.0, 43.9, 40.9, 39.3, 32.4, 29.3, 26.5, 25.3. LRMS (ES+) $[\text{M}+\text{H}]^+$ 430.5. TLC (5% CH_3OH in CH_2Cl_2), R_f 0.36 (CAM).

N-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)-2,2-dicyclohexylacetamide (HyT21, 5):

HyT21 was synthesized by the same methods as HyT13 (3).

^1H NMR (400 MHz, CDCl_3) δ 5.85 (s, 1H), 3.60-3.51 (m, 8H), 3.47-3.51 (m, 4H), 1.80-1.72 (m, 2H), 1.71-1.57 (m, 13H), 1.49-1.32 (m, 4H), 1.28-1.03 (m, 8H), 0.97-0.88 (m, 2H). ^{13}C NMR (100 MHz, CDCl_3) δ 174.2, 71.2, 70.2, 70.1, 70.0, 59.4, 45.0, 38.7, 36.4, 32.5, 31.5, 29.6, 29.5, 26.7, 26.6, 26.5, 25.4. LRMS (ES+) $[\text{M}+\text{H}]^+$ 430.6. TLC (5% CH_3OH in CH_2Cl_2), R_f 0.34 (CAM).

(S)-N-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)-2-(4-isobutylphenyl)propanamide (HyT22, 6):

HyT22 was synthesized by the same methods as HyT13 (3).

^1H NMR (500 MHz, CDCl_3) δ 7.18 (d, $J = 8.0$ Hz, 2H), 7.09 (d, $J = 8.0$ Hz, 2H), 5.88 (s, 1H), 3.53-3.45 (m, 8H), 3.44-3.36 (m, 5H), 2.44 (d, $J = 7.2$ Hz, 2H), 1.87-1.79 (m, 1H), 1.61-1.55 (m, 2H), 1.49 (d, $J = 7.2$ Hz, 3H), 1.47-1.41 (m, 2H), 1.38-1.32 (m, 2H), 0.89 (d, $J = 6.6$ Hz, 6H). ^{13}C NMR (125 MHz, CDCl_3) δ 174.4, 140.5, 138.5, 129.4, 127.2, 71.2, 70.2, 69.9, 69.7, 46.7, 44.9, 39.2, 32.4, 30.1, 29.4, 26.6, 25.3, 22.3, 18.5. LRMS (ES+) $[\text{M}+\text{H}]^+$ 412.6. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.54 (UV, CAM).

Scheme 3. Synthesis of HyT5 (1)

tert-Butyl (24-chloro-11-oxo-3,6,9,15,18-pentaoxa-12-azatetracosyl)carbamate (**14**): To a solution of Boc-11-amino-3,6,9-trioxaundecanoic acid **13** (Peptides International Inc., Boc-mini-PEG-3, 200 mg, 0.650 mmol) and 2-(2-((6-chlorohexyl)oxy)ethoxy)ethanamine **8** (145 mg, 0.650 mmol) in CH₂Cl₂ (4.5 mL) at rt were added HOBT (105 mg, 0.780 mmol) and DIEA (280 μL, 1.625 mmol). The mixture was cooled to 0 °C and EDCI (150 mg, 0.780 mmol) was added to the mixture. The resulting mixture was allowed to rt, stirred at rt for 20 h, and quenched at 0 °C with H₂O (10 mL). The mixture was extracted twice with ethyl acetate and the combined extracts were washed with brine, dried over Na₂SO₄, filtered, and concentrated. The residue was chromatographed on silica gel to afford *tert*-butyl (24-chloro-11-oxo-3,6,9,15,18-pentaoxa-12-azatetracosyl)carbamate **14** (296 mg, 89%). ¹H NMR (400 MHz, CDCl₃) δ 7.18 (brs, 1H), 5.13 (brs, 1H), 4.00 (s, 2H), 3.69-3.47 (m, 20H), 3.43 (t, *J* = 6.7 Hz, 2H), 3.31-3.28 (m, 2H), 1.79-1.72 (m, 2H), 1.61-1.54 (m, 2H), 1.47-1.40 (m, 2H),

1.42 (s, 9H), 1.38-1.32 (m, 2H). ^{13}C NMR (100 MHz, CDCl_3) δ 169.9, 155.9, 79.1, 71.2, 70.8, 70.5, 70.4, 70.2, 70.1, 69.9, 69.7, 45.0, 40.2, 38.5, 32.4, 29.4, 28.3, 26.6, 25.3. LRMS (ES+) $[\text{M}+\text{H}]^+$ 535.5. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.48 (CAM).

N-(24-Chloro-11-oxo-3,6,9,15,18-pentaoxa-12-azatetracosyl)pent-4-ynamide (15): To a stirred solution of *tert*-butyl (24-chloro-11-oxo-3,6,9,15,18-pentaoxa-12-azatetracosyl) carbamate **14** (170 mg, 0.332 mmol) in CH_2Cl_2 (2.5 mL) at 0 °C was added TFA (0.5 mL). The reaction mixture was stirred at 0 °C for 2.5 h and concentrated. The crude amine was used for the next reaction without further purification.

To a solution of crude amine (0.330 mmol) and 4-pentynoic acid (32 mg, 0.330 mmol) in CH_2Cl_2 (2.5 mL) at rt were added HOBt (54 mg, 0.396 mmol) and DIEA (150 μL , 0.825 mmol). The mixture was cooled to 0 °C and EDCI (76 mg, 0.396 mmol) was added to the mixture. The resulting mixture was allowed to rt, stirred at rt for 17 h, and quenched at 0 °C with H_2O (5 mL). The mixture was extracted three times with ethyl acetate and the combined extracts were washed with brine, dried over Na_2SO_4 , filtered, and concentrated. The residue was chromatographed on silica gel to provide *N*-(24-chloro-11-oxo-3,6,9,15,18-pentaoxa-12-azatetracosyl)pent-4-ynamide **15** (140 mg, 86%). ^1H NMR (400 MHz, CDCl_3) δ 7.18 (brs, 1H), 6.71 (brs, 1H), 4.02 (s, 2H), 3.70-3.64 (m, 4H), 3.63-3.59 (m, 6H), 3.57-3.54 (m, 6H), 3.53-3.48 (m, 4H), 3.47-3.42 (m, 4H), 2.54-2.49 (m, 2H), 2.43-2.39 (m, 2H), 1.99 (t, $J = 2.6$ Hz, 1H), 1.80-1.72 (m, 2H), 1.62-1.55 (m, 2H), 1.48-1.40 (m, 2H), 1.39-1.31 (m, 2H). ^{13}C NMR (100 MHz, CDCl_3) δ 171.2, 170.3, 83.1, 71.2, 70.6, 70.5, 70.3, 70.2, 70.1, 70.0, 69.9, 69.7, 69.1, 45.0, 39.3, 38.6, 35.0, 32.4, 29.4, 26.6, 25.3, 14.8. LRMS (ES+) $[\text{M}+\text{H}]^+$ 515.62. TLC (5% CH_3OH in CH_2Cl_2), R_f 0.42 (UV, CAM).

tert-Butyl (2-(2-(2-(2-azidoethoxy)ethoxy)ethoxy)ethyl)carbamate (16): To a solution of 11-azido-3,6,9-trioxaundecan-1-amine (Fluka, 370 mg, 1.695 mmol) in $\text{C}_2\text{H}_5\text{OH}$ (3.5 mL) at 0 °C was added Boc_2O (370 mg, 1.695 mmol). The reaction mixture was stirred at rt for 12 h and evaporated. The residue was diluted with CH_2Cl_2 (5 mL) & H_2O (5 mL) and the mixture was extracted twice with CH_2Cl_2 . The combined extracts were washed with brine, dried over Na_2SO_4 , filtered, and concentrated. The crude residue was purified by flash chromatography on silica gel to provide *tert*-butyl (2-(2-(2-(2-azidoethoxy)ethoxy)ethoxy)ethyl)carbamate **16**

(518 mg, 96%). $^1\text{H NMR}$ (400 MHz, CDCl_3) δ 5.01 (s, 1H), 3.69-3.59 (m, 10H), 3.53 (t, $J = 5.1$ Hz, 2H), 3.38 (t, $J = 5.1$ Hz, 2H), 3.32-3.29 (m, 2H), 1.43 (s, 9H). TLC (10% CH_3OH in CH_2Cl_2), R_f 0.49 (CAM).

tert-Butyl (2-(2-(2-(2-(4-(28-chloro-3,15-dioxo-7,10,13,19,22-pentaoxa-4,16-diazaoctacosyl)-1*H*-1,2,3-triazol-1-yl)ethoxy)ethoxy)ethoxy)ethyl)carbamate (17): To a solution of *tert*-butyl (2-(2-(2-(2-azidoethoxy)ethoxy)ethoxy)ethyl)carbamate **16** (37 mg, 0.116 mmol) and *N*-(24-chloro-11-oxo-3,6,9,15,18-pentaoxa-12-azatetracosyl)pent-4-ynamide **15** (57 mg, 0.116 mmol) in *t*-BuOH- H_2O (1:1, 0.5 mL) and THF (0.5 mL) at rt were added $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ (3 mg, 0.012 mmol) and sodium ascorbate (1.0 M in H_2O , 3 drops). The reaction mixture was stirred at rt for 22 h and evaporated. The residue was diluted with H_2O (5 mL) and the mixture was extracted three times with ethyl acetate. The combined extracts were washed with brine, dried over Na_2SO_4 , filtered, and concentrated. The crude residue was purified by flash chromatography on silica gel to give *tert*-butyl (2-(2-(2-(2-(4-(28-chloro-3,15-dioxo-7,10,13,19,22-pentaoxa-4,16-diazaoctacosyl)-1*H*-1,2,3-triazol-1-yl)ethoxy)ethoxy)ethoxy)ethyl)carbamate **17** (86 mg, 92%). $^1\text{H NMR}$ (400 MHz, CDCl_3) δ 7.54 (s, 1H), 7.17 (brs, 1H), 6.60 (brs, 1H), 5.11 (brs, 1H), 4.49 (t, $J = 5.1$ Hz, 2H), 4.02 (s, 2H), 3.84 (t, $J = 5.1$ Hz, 2H), 3.70-3.38 (m, 34H), 3.31-3.28 (m, 2H), 3.03 (t, $J = 7.4$ Hz, 2H), 2.61 (t, $J = 5.1$ Hz, 2H), 1.79-1.72 (m, 2H), 1.61-1.54 (m, 2H), 1.47-1.40 (m, 2H), 1.42 (s, 9H), 1.39-1.31 (m, 2H). $^{13}\text{C NMR}$ (100 MHz, CDCl_3) δ 172.0, 170.1, 155.9, 146.3, 122.6, 79.1, 77.2, 71.2, 70.65, 70.62, 70.54, 70.51, 70.47, 70.42, 70.3, 70.2, 70.16, 70.14, 69.9, 69.8, 69.7, 69.4, 50.1, 45.0, 40.2, 39.2, 38.5, 35.5, 32.4, 29.4, 28.4, 26.6, 25.3, 21.4. 3-(1-(2-(2-(2-(2-aminoethoxy)ethoxy)ethoxy)ethyl)-1*H*-1,2,3-triazol-4-yl)-*N*-(24-chloro-11-oxo-3,6,9,15,18-pentaoxa-12-azatetracosyl)propanamide (HyT5, 1): To a solution of *tert*-butyl (2-(2-(2-(2-(4-(28-chloro-3,15-dioxo-7,10,13,19,22-pentaoxa-4,16-diazaoctacosyl)-1*H*-1,2,3-triazol-1-yl)ethoxy)ethoxy)ethoxy)ethyl) carbamate **17** (30 mg, 0.037 mmol) in CH_2Cl_2 (2.0 mL) at 0 °C were added TFA (0.5 mL). After stirring at 0 °C for 2.5 h, TFA and solvent were removed in vacuo and the residue was diluted with MeOH (0.5 mL). The solution was cooled to 5 °C and K_2CO_3 (26 mg, 0.185 mmol) was added to the mixture. The mixture was stirred at the same temperature for 30 min and extracted three times with ethyl acetate. The

combined extracts were washed with brine, dried over Na_2SO_4 , filtered, and concentrated. The crude residue was purified by flash chromatography on silica gel to give the proposed structure of 3-(1-(2-(2-(2-(2-aminoethoxy)ethoxy)ethoxy)ethyl)-1*H*-1,2,3-triazol-4-yl)-*N*-(24-chloro-11-oxo-3,6,9,15,18-penta oxa-12-azatetracosyl)propanamide **1** (HyT5, 24.5 mg, 93%). ^1H NMR (400 MHz, CD_3OD) δ 7.77 (s, 1H), 4.53 (t, $J = 5.1$ Hz, 2H), 3.99 (s, 2H), 3.86 (t, $J = 5.1$ Hz, 2H), 3.70-3.50 (m, 28H), 3.46 (t, $J = 6.5$ Hz, 2H), 3.41 (t, $J = 5.6$ Hz, 2H), 3.35 (t, $J = 5.4$ Hz, 2H), 3.12 (t, $J = 5.0$ Hz, 2H), 2.98 (t, $J = 7.5$ Hz, 2H), 2.56 (t, $J = 7.6$ Hz, 2H), 1.79-1.72 (m, 2H), 1.61-1.54 (m, 2H), 1.49-1.43 (m, 2H), 1.42-1.35 (m, 2H). ^{13}C NMR (100 MHz, CD_3OD) δ 174.6, 172.7, 147.6, 124.1, 72.1, 71.8, 71.5, 71.4, 71.37, 71.33, 71.29, 71.22, 71.1, 70.6, 70.47, 70.40, 67.9, 51.2, 45.7, 40.6, 40.3, 39.8, 36.2, 33.7, 30.5, 27.7, 26.5, 22.5. LRMS (ES+) $[\text{M}+\text{H}]^+$ 711.36, $[\text{M}+\text{Na}]^+$ 733.36. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.09 (Ninhydrin, CAM).

Scheme 4. Synthesis of HyT6 (**20**)

(4-Adamantan-1-yl-phenoxy) acetic acid ethyl ester (**18**): To a solution of 4-(1-adamantyl)phenol (250 mg, 1.095 mmol) in DMF (2 mL) at rt were added ethyl bromoacetate (150 μL , 1.314 mmol) and K_2CO_3 (454 mg, 3.285 mmol). The reaction mixture was stirred at rt for 20 h and diluted with H_2O (10 mL) and ethyl acetate (10 mL). The mixture was extracted twice with ethyl acetate and the extracts were washed with sat. NaHCO_3 and brine.

The combined organic layers were dried over Na₂SO₄, filtered, and concentrated. The crude residue was purified by flash chromatography on silica gel to give (4-adamantan-1-yl-phenoxy) acetic acid ethyl ester **18** (335 mg, quant.) as a white solid. ¹H NMR (500 MHz, CDCl₃) δ 7.27 (d, *J* = 8.7 Hz, 2H), 6.86 (d, *J* = 8.7 Hz, 2H), 4.59 (s, 2H), 4.27 (q, *J* = 7.1 Hz, 2H), 2.08 (s, 3H), 1.87 (d, *J* = 2.4 Hz, 6H), 1.79-1.71 (m, 6H), 1.30 (t, *J* = 7.0 Hz, 3H). ¹³C NMR (125 MHz, CDCl₃) δ 169.1, 155.6, 144.7, 125.9, 114.1, 65.5, 61.2, 43.3, 36.7, 35.6, 28.9, 14.1. TLC (10% CH₃OH in CH₂Cl₂), R_f 0.48 (UV, CAM).

(4-Adamantan-1-yl-phenoxy) acetic acid (19): To a solution of ester **18** (290 mg, 0.923 mmol) in THF-H₂O (3 mL/3 mL) at rt was added LiOH·H₂O (78 mg, 1.846 mmol). The reaction mixture was stirred at rt for 15 h and THF was removed in vacuo. The aqueous mixture was diluted with H₂O (5 mL), cooled to 0 °C, and adjusted to pH 4 with 1N-HCl. The mixture was extracted twice with ethyl acetate and the extracts were washed with brine. The combined organic layers were dried over Na₂SO₄, filtered, and concentrated. The crude residue was solidified with hexanes and the solid was filtered with hexanes and dried in vacuo to furnish (4-adamantan-1-yl-phenoxy) acetic acid **19** (246 mg, 93%) as a white solid. ¹H NMR (400 MHz, CD₃OD) δ 7.26 (d, *J* = 8.8 Hz, 2H), 6.84 (d, *J* = 8.8 Hz, 2H), 4.60 (s, 2H), 2.05 (s, 3H), 1.89 (s, 6H), 1.83-1.75 (m, 6H).

3-(1-(1-(4-((3*r*,5*r*,7*r*)-Adamantan-1-yl)phenoxy)-2-oxo-6,9,12-trioxa-3-azatetradecan-14-yl)-1*H*-1,2,3-triazol-4-yl)-*N*-(24-chloro-11-oxo-3,6,9,15,18-pentaoxa-12-azatetracosyl)propanamide (HyT6, 20): To a solution of (4-adamantan-1-yl-phenoxy) acetic acid **19** (6.3 mg, 0.022 mmol) in DMF (0.5 mL) at rt were added HATU (10 mg, 0.027 mmol) and DIEA (10 μL, 0.055 mmol). The mixture was stirred at rt for 0.5 h and a solution of HyT5 **1** (16.5 mg, 0.023 mmol) in DMF (0.5 mL) was added to the mixture. The resulting mixture was stirred at rt for 22 h, and quenched at 0 °C with H₂O (5 mL). The mixture was extracted three times with ethyl acetate and the combined extracts were washed with brine, dried over Na₂SO₄, filtered, and concentrated. The residue was chromatographed on silica gel to provide HyT6 **20** (19 mg, 88%). ¹H NMR (500 MHz, CD₃OD) δ 7.74 (s, 1H), 7.26 (d, *J* = 8.8 Hz, 2H), 6.87 (d, *J* = 8.8 Hz, 2H), 5.46 (s, 1H), 4.46 (t, *J* = 4.9 Hz, 2H), 4.45 (s, 2H), 3.98 (s, 2H), 3.80 (t, *J* = 5.1 Hz, 2H), 3.65 (s, 4H), 3.63-3.61 (m, 2H), 3.59-3.51 (m, 20H), 3.49 (t, *J* = 5.5 Hz, 2H), 3.45-3.42 (m, 4H), 3.39 (t, *J* = 5.5 Hz, 2H), 3.32 (t, *J* = 5.2 Hz, 2H), 2.95 (t,

$J = 7.6$ Hz, 2H), 2.52 (t, $J = 7.6$ Hz, 2H), 2.04 (s, 3H), 1.86 (d, $J = 2.3$ Hz, 6H), 1.80-1.70 (m, 8H), 1.57-1.52 (m, 2H), 1.46-1.40 (m, 2H), 1.38-1.32 (m, 2H). ^{13}C NMR (125 MHz, CD_3OD) δ 174.7, 127.0, 124.2, 115.4, 72.2, 71.8, 71.6, 71.5, 71.4, 71.32, 71.30, 71.2, 71.1, 70.8, 70.5, 70.4, 51.3, 45.7, 44.5, 40.3, 39.9, 39.8, 37.8, 36.7, 36.3, 33.7, 30.5, 30.4, 27.7, 26.5, 22.5. calculated for $C_{52}H_{76}N_6O_{11}Cl$ $[M+H]^+$ 995.5261, found 995.5265. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.62 (UV, CAM).

N-(2-(2-((6-Chlorohexyl)oxy)ethoxy)ethyl)-3,3,3-triphenylpropanamide (HyT8, 22):

HyT8 was synthesized by the same methods as HyT13 (3).

1H NMR (400 MHz, $CDCl_3$) δ 7.31-7.26 (m, 12H), 7.23-7.19 (m, 3H), 5.36 (brs, 1H), 3.58 (s, 2H), 3.53 (t, J = 6.7 Hz, 2H), 3.48-3.46 (m, 2H), 3.45-3.41 (m, 4H), 3.22-3.20 (m, 2H), 3.16-3.13 (m, 2H), 1.81-1.74 (m, 2H), 1.63-1.56 (m, 2H), 1.49-1.42 (m, 2H), 1.40-1.32 (m, 2H).
 ^{13}C NMR (100 MHz, $CDCl_3$) δ 170.3, 146.3, 129.1, 127.9, 126.2, 71.2, 70.0, 69.8, 69.3, 56.1, 48.4, 45.0, 38.9, 32.4, 29.3, 26.6, 25.3. HRMS (ES $^+$) calculated for $C_{31}H_{39}NO_3Cl$ $[M+H]^+$ 508.2618, found 508.2617. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.69 (UV, CAM).

Supplementary Scheme 6. Synthesis of HyT9 (24)

tert-Butyl (6-((2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)amino)-6-oxohexyl)carbamate 23: To a solution of 6-(Boc-amino)-caproic acid (28 mg, 0.121 mmol) and amine 8 (27 mg, 0.121

mmol) in CH₂Cl₂ (1.5 mL) at rt were added HOBt (20 mg, 0.145 mmol, 1.2 equiv.) and DIEA (63 μL, 0.363 mmol). The reaction mixture was cooled to 0 °C and EDCI (28 mg, 0.145 mmol, 1.2 equiv.) was added to the mixture. The resulting mixture was stirred at rt for 20 h and quenched at 0 °C with H₂O (5 mL). The mixture was extracted twice with ethyl acetate and the combined extracts were washed with brine, dried over Na₂SO₄, filtered, and concentrated. The residue was chromatographed on silica gel to afford *tert*-Butyl (6-((2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl) amino)-6-oxohexyl)carbamate **23** (45 mg, 85%). ¹H NMR (400 MHz, CDCl₃) δ 6.09 (s, 1H), 4.59 (s, 1H), 3.60-3.49 (m, 8H), 3.46-3.40 (m, 4H), 2.15 (t, *J* = 7.4 Hz, 2H), 1.78-1.71 (m, 2H), 1.66-1.55 (m, 4H), 1.50-1.39 (m, 4H), 1.41 (s, 9H), 1.37-1.27 (m, 2H). ¹³C NMR (100 MHz, CDCl₃) δ 172.8, 155.9, 79.0, 71.2, 70.1, 69.9, 69.7, 44.9, 39.0, 36.4, 32.4, 29.7, 29.3, 28.3, 26.6, 26.3, 25.3, 25.2. TLC (10% CH₃OH in CH₂Cl₂), R_f 0.46 (UV, CAM).

N-(2-(2-((6-Chlorohexyl)oxy)ethoxy)ethyl)-6-(3,3,3-triphenylpropanamido)hexanamide (HyT9, **24**):

To a stirred solution of *tert*-Butyl (6-((2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)amino)-6-oxohexyl) carbamate **23** (30 mg, 0.0687 mmol) in CH₂Cl₂ (1.5 mL) at 0 °C was added TFA (0.5 mL). The reaction mixture was stirred at 0 °C for 2.0 h and concentrated. The crude amine was used for the next reaction without further purification.

To a solution of crude amine and 3,3,3-triphenyl propionic acid (20 mg, 0.068 mmol) in CH₂Cl₂ (1.0 mL) at rt were added HOBt (11 mg, 0.0816 mmol) and DIEA (36 μL, 0.204 mmol). The mixture was cooled to 0 °C and EDCI (16 mg, 0.0816 mmol) was added to the mixture. The resulting mixture was allowed to rt, stirred at rt for 17 h, and quenched at 0 °C with H₂O (3 mL). The mixture was extracted three times with ethyl acetate and the combined extracts were washed with brine, dried over Na₂SO₄, filtered, and concentrated. The residue was chromatographed on silica gel to provide **24** (HyT9, 35 mg, 83%). ¹H NMR (500 MHz, CD₃OD) δ 7.89 (s, 1H), 7.23-7.16 (m, 13H), 7.12-7.09 (m, 3H), 3.55-3.45 (m, 10H), 3.42 (t, *J* = 6.5 Hz, 2H), 3.30-3.28 (m, 2H), 2.80-2.78 (m, 2H), 2.07 (t, *J* = 7.2 Hz, 2H), 1.73-1.67 (m, 2H), 1.56-1.50 (m, 2H), 1.45-1.37 (m, 4H), 1.36-1.31 (m, 2H), 1.11-1.09 (m, 2H), 1.05-1.02 (m, 2H). ¹³C NMR (125 MHz, CD₃OD) δ 176.1, 172.9, 172.8, 148.3, 130.6, 128.6, 127.1,

72.2, 71.2, 71.1, 70.6, 57.6, 48.2, 40.3, 40.0, 36.8, 33.7, 30.5, 29.7, 27.7, 27.4, 26.5, 26.4. HRMS (ES+) calculated for $C_{37}H_{50}N_2O_4Cl$ $[M+H]^+$ 621.3459, found 621.3460. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.48 (UV, CAM).

N-(24-chloro-11-oxo-3,6,9,15,18-pentaoxa-12-azatetracosyl)-3,3,3-triphenylpropanamide (HyT10, 25): HyT10 was synthesized by the similar methods as HyT9.

Supplementary Scheme 7. Synthesis of HyT10 (25)

1H NMR (400 MHz, $CDCl_3$) δ 7.29-7.17 (m, 15H), 7.12 (s, 1H), 5.68 (s, 1H), 4.00 (s, 2H), 3.66-3.64 (m, 2H), 3.62-3.60 (m, 2H), 3.59-3.57 (m, 4H), 3.55-3.51 (m, 8H), 3.20-3.17 (m, 2H), 3.15-3.13 (m, 2H), 1.80-1.73 (m, 2H), 1.62-1.55 (m, 2H), 1.49-1.41 (m, 2H), 1.39-1.32 (m, 2H). ^{13}C NMR (100 MHz, $CDCl_3$) δ 170.5, 170.1, 146.5, 129.2, 127.9, 126.2, 71.2, 70.6, 70.5, 70.4, 70.3, 70.2, 69.9, 69.7, 69.5, 56.1, 48.1, 45.0, 39.0, 38.5, 32.4, 29.4, 26.6, 25.3. S)-*N*-(2-(2-((6-Chlorohexyl)oxy)ethoxy)ethyl)-2-(3,4,5-trimethoxyphenyl)butanamide

(HyT11, 26): HyT11 was synthesized by the same methods as HyT13 (3).

^1H NMR (400 MHz, CDCl_3) δ 6.51 (s, 2H), 6.01 (brs, 1H), 3.84 (s, 6H), 3.81 (s, 3H), 3.54-3.45 (m, 9H), 3.43-3.32 (m, 3H), 3.10 (t, $J = 7.5$ Hz, 1H), 2.17-2.06 (m, 1H), 1.85-1.70 (m, 3H), 1.61-1.54 (m, 2H), 1.47-1.39 (m, 2H), 1.37-1.30 (m, 2H), 0.87 (t, $J = 7.3$ Hz, 3H). ^{13}C NMR (100 MHz, CDCl_3) δ 173.3, 153.2, 136.8, 135.8, 104.7, 71.1, 70.2, 69.9, 69.8, 60.7, 56.0, 55.3, 44.9, 39.2, 32.4, 29.3, 26.6, 26.5, 25.3, 12.3. HRMS (ES+) calculated for $\text{C}_{23}\text{H}_{39}\text{NO}_6\text{Cl}$ $[\text{M}+\text{H}]^+$ 460.2466, found 460.2465. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.62 (UV, CAM).

2-(4-((3*r*,5*r*,7*r*)-Adamantan-1-yl)phenoxy)-*N*-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)acetamide (HyT14, **27**): HyT14 was synthesized by the same methods as HyT13 (**3**).

Scheme 8. Synthesis of HyT14 (**27**)

To a solution of (4-adamantan-1-yl-phenoxy) acetic acid **19** (27 mg, 0.094 mmol) and amine **8** (21 mg, 0.094 mmol) in CH_2Cl_2 (1.5 mL) at rt were added HOBt (15 mg, 0.113 mmol) and DIEA (50 μL , 0.282 mmol). The reaction mixture was cooled to 0 $^\circ\text{C}$ and EDCI (22 mg, 0.113 mmol) was added to the mixture. The resulting mixture was stirred at rt for 22 h and

quenched at 0 °C with H₂O (4 mL). The mixture was extracted twice with ethyl acetate and the combined extracts were washed with brine, dried over Na₂SO₄, filtered, and concentrated. The residue was chromatographed on silica gel to afford **27** (HyT14, 42 mg, 92%). ¹H NMR (400 MHz, CDCl₃) δ 7.29 (d, *J* = 8.8 Hz, 2H), 7.04 (brs, 1H), 6.86 (d, *J* = 8.8 Hz, 2H), 4.47 (s, 2H), 3.58-3.52 (m, 8H), 3.51 (t, *J* = 6.7 Hz, 2H), 3.44 (d, *J* = 6.7 Hz, 2H), 2.08 (s, 3H), 1.87 (s, 6H), 1.79-1.71 (m, 8H), 1.62-1.55 (m, 2H), 1.46-1.38 (m, 2H), 1.37-1.30 (m, 2H). ¹³C NMR (100 MHz, CDCl₃) δ 168.4, 155.0, 145.1, 126.0, 114.2, 71.2, 70.3, 69.9, 67.4, 45.0, 43.3, 38.7, 36.7, 35.6, 32.4, 29.4, 28.8, 26.6, 25.3. HRMS (ES+) calculated for C₂₈H₄₃NO₄Cl [M+H]⁺ 492.2881, found 492.2883. TLC (10% CH₃OH in CH₂Cl₂), R_f 0.65 (UV, CAM).

(1*S*)-*N*-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)-7,7-dimethyl-2-oxobicyclo[2.2.1]heptane-1-carboxamide (HyT15, **28**): Hy15 was synthesized by the same methods as HyT13 (**3**).

¹H NMR (400 MHz, CDCl₃) δ 7.79 (s, 1H), 3.62-3.53 (m, 6H), 3.54-3.48 (m, 4H), 3.46 (t, *J* = 6.4 Hz, 2H), 2.53 (dd, *J* = 13.9, 4.0 Hz, 1H), 2.48 (dd, *J* = 5.6, 5.0 Hz, 1H), 2.17-2.09 (m, 1H), 2.07 (t, *J* = 4.5 Hz, 1H), 1.95 (d, *J* = 18.6 Hz, 2H), 1.80-1.73 (m, 2H), 1.62-1.55 (m, 2H), 1.47-1.32 (m, 4H). ¹³C NMR (100 MHz, CDCl₃) δ 216.9, 169.1, 71.2, 70.4, 70.0, 69.8, 64.6, 50.1, 45.0, 43.7, 43.2, 38.6, 32.5, 29.4, 28.1, 27.6, 26.7, 25.4, 20.9, 20.4. HRMS (ES+) calculated for C₂₀H₃₅NO₄Cl [M+H]⁺ 388.2255, found 388.2253. TLC (10% CH₃OH in CH₂Cl₂), R_f 0.57 (UV, CAM).

N-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)-6-fluoro-2-naphthamide (HyT17, **29**):

HyT17 was synthesized by the same methods as HyT13 (**3**).

^1H NMR (400 MHz, CDCl_3) δ 8.31 (s, 1H), 7.91 (dd, $J = 9.0, 5.6$ Hz, 1H), 7.85 (dd, $J = 8.7, 8.7$ Hz, 1H), 7.83 (dd, $J = 8.5, 8.5$ Hz, 1H), 7.47 (dd, $J = 9.6, 2.4$ Hz, 1H), 7.31 (ddd, $J = 8.7, 8.7, 2.5$ Hz, 1H), 3.72-3.70 (m, 4H), 3.69-3.66 (m, 2H), 3.62-3.59 (m, 2H), 3.46 (d, $J = 6.5$ Hz, 2H), 3.44 (d, $J = 6.5$ Hz, 2H), 1.71-1.64 (m, 2H), 1.57-1.50 (m, 2H), 1.39-1.21 (m, 4H). ^{13}C NMR (100 MHz, CDCl_3) δ 167.2, 162.8, 160.3, 135.6, 135.5, 131.4, 131.3, 131.23, 131.21, 129.5, 127.7, 127.6, 127.5, 124.6, 117.3, 117.1, 111.0, 110.8, 71.2, 70.2, 69.9, 69.7, 44.9, 39.7, 32.4, 29.4, 26.5, 25.3. HRMS (ES $^+$) calculated for $\text{C}_{21}\text{H}_{28}\text{NO}_3\text{ClF}$ $[\text{M}+\text{H}]^+$ 396.1742, found 396.1744. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.65 (UV, CAM).

2-(4-((3*r*,5*r*,7*r*)-adamantan-1-yl)phenoxy)-*N*-(24-chloro-11-oxo-3,6,9,15,18-pentaoxa-12-azatetracosyl)acetamide (HyT18, **30**): HyT18 was synthesized by the same methods as HyT9.

Scheme 9. Synthesis of HyT18 (**30**)

^1H NMR (400 MHz, CD_3OD) δ 7.29 (d, $J = 8.8$ Hz, 2H), 6.90 (d, $J = 8.8$ Hz, 2H), 4.47 (s, 2H), 3.95 (s, 2H), 3.64 (s, 4H), 3.60-3.51 (m, 14H), 3.47-3.39 (m, 6H), 2.06 (s, 3H), 1.89 (d, $J = 2.2$ Hz, 6H), 1.80-1.70 (m, 8H), 1.59-1.52 (m, 2H), 1.48-1.42 (m, 2H), 1.41-1.34 (m, 2H). ^{13}C NMR (100 MHz, CD_3OD) δ 172.8, 171.4, 156.9, 146.1, 127.0, 115.4, 72.2, 71.9, 71.5,

71.4, 71.3, 71.2, 71.1, 70.5, 70.4, 68.4, 45.7, 44.5, 39.9, 39.8, 37.8, 36.7, 33.7, 30.5, 30.4, 27.7, 26.5. HRMS (ES+) calculated for $C_{36}H_{58}N_2O_8Cl$ $[M+H]^+$ 681.3871, found 681.3861. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.62 (UV, CAM).

N-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)-2-(((2*S*,5*R*)-2-isopropyl-5-methylcyclohexyl)oxy)acetamide (HyT23, 31): HyT23 was synthesized by the same methods as 3.

1H NMR (400 MHz, $CDCl_3$) δ 6.97 (brs, 1H), 4.05 (d, $J = 15.1$ Hz, 1H), 3.84 (d, $J = 15.1$ Hz, 1H), 3.61-3.59 (m, 2H), 3.57-3.54 (m, 4H), 3.52 (t, $J = 6.7$ Hz, 2H), 3.49 (t, $J = 5.0$ Hz, 2H), 3.45 (t, $J = 6.6$ Hz, 2H), 3.13 (td, $J = 10.6, 4.1$ Hz, 1H), 2.12 (dtd, $J = 14.0, 7.0, 2.8$ Hz, 1H), 2.06-2.00 (m, 1H), 1.80-1.73 (m, 2H), 1.67-1.63 (m, 2H), 1.62-1.55 (m, 2H), 1.48-1.23 (m, 7H), 0.96 (qd, $J = 13.8, 3.2$ Hz, 1H), 0.91 (d, $J = 1.2$ Hz, 3H), 0.90 (d, $J = 1.8$ Hz, 3H), 0.89-0.81 (m, 2H), 0.77 (d, $J = 6.9$ Hz, 3H). ^{13}C NMR (100 MHz, $CDCl_3$) δ 170.4, 80.5, 71.2, 70.3, 70.0, 69.8, 67.9, 47.9, 45.0, 40.1, 38.4, 34.3, 32.5, 31.3, 29.4, 26.6, 25.9, 25.4, 23.2, 22.2, 20.9, 16.2. HRMS (ES+) calculated for $C_{22}H_{43}NO_4Cl$ $[M+H]^+$ 420.2881, found 420.2881. TLC (33% EtOAc in Hexanes), R_f 0.14 (CAM).

(*R*)-*N*-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)-2-(2-fluoro-[1,1'-biphenyl]-4-yl) propanamide

(HyT24, 32): HyT24 was synthesized by the same methods as HyT13 (3).

^1H NMR (400 MHz, CDCl_3) δ 7.53-7.51 (m, 2H), 7.45-7.33 (m, 4H), 7.17-7.11 (m, 2H), 6.04 (brs, 1H), 3.59-3.48 (m, 9H), 3.46-3.39 (m, 4H), 1.78-1.71 (m, 2H), 1.60-1.53 (m, 2H), 1.54 (d, $J = 7.1$ Hz, 3H), 1.46-1.39 (m, 2H), 1.37-1.29 (m, 2H). ^{13}C NMR (100 MHz, CDCl_3) δ 173.4, 160.9, 158.4, 142.9, 142.8, 135.4, 130.9, 130.8, 128.9, 128.8, 128.4, 127.7, 127.6, 71.2, 70.2, 69.9, 69.6, 46.5, 44.9, 39.3, 32.4, 29.4, 26.6, 25.3, 18.5. HRMS (ES+) calculated for $\text{C}_{25}\text{H}_{34}\text{NO}_3\text{ClF}$ $[\text{M}+\text{H}]^+$ 450.2211, found 450.2209. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.66 (UV, CAM).

2-(2,2,4,7-tetramethyl-3,4-dihydroquinolin-1(2H)-yl)ethyl(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)

carbamate (HyT25, 33): HyT25 was synthesized by the similar methods as **3**.

^1H NMR (400 MHz, CD_3OD) δ 6.97 (d, $J = 7.7$ Hz, 1H), 6.51 (s, 1H), 6.42 (d, $J = 7.7$ Hz, 1H), 4.13 (dd, $J = 8.7, 5.8$ Hz, 1H), 4.06 (dd, $J = 8.7, 5.7$ Hz, 1H), 3.64-3.56 (m, 4H), 3.55-3.50 (m, 4H), 3.47 (t, $J = 6.5$ Hz, 2H), 3.30-3.26 (m, 4H), 2.87-2.78 (m, 1H), 2.23 (s, 3H), 1.77-1.70 (m, 3H), 1.62-1.55 (m, 2H), 1.48-1.35 (m, 5H), 1.29 (s, 3H), 1.26 (d, $J = 6.7$ Hz, 3H), 1.13 (s, 3H). ^{13}C NMR (125 MHz, CD_3OD) δ 159.0, 145.8, 137.3, 126.9, 126.5, 118.1, 113.4, 72.2, 71.3, 71.2, 70.9, 63.8, 55.2, 45.6, 44.9, 41.7, 33.7, 30.5, 30.0, 28.3, 27.7, 26.5, 24.4, 21.8, 20.8. HRMS (ES+) calculated for $\text{C}_{26}\text{H}_{44}\text{N}_2\text{O}_4\text{Cl}$ $[\text{M}+\text{H}]^+$ 483.2990, found 483.2986. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.43 (UV, CAM).

2-(10H-phenoxazin-10-yl)ethyl (2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)carbamate (HyT26, 34):

HyT26 was synthesized by the similar methods as HyT13 (3).

^1H NMR (500 MHz, CD_3OD) δ 6.79 (dd, $J = 8.2, 1.5$ Hz, 1H), 6.78 (dd, $J = 8.2, 1.5$ Hz, 1H), 6.72 (d, $J = 7.5$ Hz, 2H), 6.64 (dd, $J = 7.5, 1.3$ Hz, 1H), 6.62 (dd, $J = 7.4, 1.3$ Hz, 1H), 6.57 (dd, $J = 7.8, 1.3$ Hz, 2H), 4.25 (t, $J = 6.4$ Hz, 2H), 3.81 (t, $J = 6.4$ Hz, 2H), 3.56-3.53 (m, 3H), 3.51 (t, $J = 6.6$ Hz, 3H), 3.48 (t, $J = 5.5$ Hz, 2H), 3.44 (t, $J = 6.5$ Hz, 2H), 3.26 (t, $J = 5.5$ Hz, 2H), 1.76-1.70 (m, 2H), 1.59-1.53 (m, 2H), 1.46-1.40 (m, 2H), 1.39-1.32 (m, 2H). ^{13}C NMR (125 MHz, CD_3OD) δ 159.1, 146.5, 134.8, 125.3, 122.6, 116.7, 113.5, 72.6, 71.7, 71.6, 71.3, 61.6, 46.1, 44.7, 42.2, 34.1, 30.9, 28.2, 26.9. HRMS (ES $^+$) calculated for $\text{C}_{25}\text{H}_{34}\text{N}_2\text{O}_5\text{Cl}$ $[\text{M}+\text{H}]^+$ 477.2156, found 477.2152. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.43 (UV, CAM).

(R)-N-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)-3,3,3-trifluoro-2-methoxy-2-phenylpropanamide

(HyT27, 35): HyT27 was synthesized by the same methods as HyT13 (3).

^1H NMR (400 MHz, CDCl_3) δ 7.55-7.53 (m, 2H), 7.40-7.38 (m, 3H), 7.17 (brs, 1H), 3.59-3.56 (m, 5H), 3.54-3.48 (m, 5H), 3.43 (t, $J = 6.7$ Hz, 2H), 3.41 (s, 3H), 1.79-1.72 (m, 2H),

1.61-1.54 (m, 2H), 1.48-1.40 (m, 2H), 1.39-1.31 (m, 2H). ^{13}C NMR (100 MHz, CDCl_3) δ 166.3, 132.6, 129.4, 128.4, 127.6, 71.2, 70.2, 69.9, 69.4, 54.9, 45.0, 39.1, 32.4, 29.4, 26.6, 25.3. HRMS (ES+) calculated for $\text{C}_{20}\text{H}_{30}\text{NO}_4\text{ClF}_3$ $[\text{M}+\text{H}]^+$ 440.1815, found 440.1814. TLC (33% EtOAc in Hexanes), R_f 0.51 (UV, CAM).

(R)-1-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)-3-(3-methyl-1,1-diphenylbutan-2-yl)urea
(HyT29,

36): HyT29 was synthesized by the same methods as HyT13 (**3**).

^1H NMR (400 MHz, CDCl_3) δ 7.38 (dd, $J = 6.7, 6.7$ Hz, 4H), 7.32-7.25 (m, 4H), 7.22-7.14 (m, 2H), 4.72 (t, $J = 9.7$ Hz, 1H), 4.60 (t, $J = 5.7$ Hz, 1H), 4.23 (d, $J = 9.8$ Hz, 1H), 3.95 (d, $J = 11.0$ Hz, 1H), 3.57 (t, $J = 6.6$ Hz, 2H), 3.55-3.42 (m, 7H), 3.37-3.32 (m, 1H), 3.30-3.15 (m, 2H), 1.85-1.78 (m, 2H), 1.76-1.68 (m, 1H), 1.67-1.60 (m, 2H), 1.54-1.46 (m, 2H), 1.44-1.36 (m, 2H), 0.98 (d, $J = 6.8$ Hz, 3H), 0.88 (d, $J = 6.8$ Hz, 3H), 0.04 (s, 6H). ^{13}C NMR (100 MHz, CDCl_3) δ 158.3, 143.1, 142.8, 128.7, 128.4, 128.3, 127.9, 126.4, 126.3, 71.2, 70.9, 70.3, 70.0, 55.7, 45.0, 40.5, 32.5, 29.4, 29.2, 26.6, 25.4, 20.8, 15.1, 0.0. HRMS (ES+) calculated for $\text{C}_{28}\text{H}_{42}\text{N}_2\text{O}_3\text{Cl}$ $[\text{M}+\text{H}]^+$ 489.2884, found 489.2881. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.62 (UV, CAM).

2-(bis((R)-1-phenylethyl)amino)-N-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)acetamide
(HyT30, **37**): HyT30 was synthesized by the same methods as HyT13 (**3**).

^1H NMR (500 MHz, CD_3OD) δ 7.34 (s, 4H), 7.33 (s, 4H), 7.27-7.23 (m, 2H), 4.87 (s, 2H), 3.95 (q, $J = 6.8$ Hz, 2H), 3.67-3.60 (m, 4H), 3.52-3.42 (m, 6H), 3.38 (d, $J = 17.6$ Hz, 1H), 3.27-3.16 (m, 2H), 2.85 (d, $J = 17.6$ Hz, 1H), 1.73-1.68 (m, 2H), 1.60-1.54 (m, 2H), 1.45-1.34 (m, 4H), 1.35 (d, $J = 6.8$ Hz, 6H). ^{13}C NMR (100 MHz, CDCl_3) \square 170.0, 142.7, 128.4, 127.7, 127.2, 71.3, 70.4, 70.0, 69.8, 59.5, 50.3, 45.0, 38.4, 32.4, 29.4, 26.5, 25.4, 20.0, -0.03. HRMS (ES $^+$) calculated for $\text{C}_{28}\text{H}_{42}\text{N}_2\text{O}_3\text{Cl}$ $[\text{M}+\text{H}]^+$ 489.2884, found 489.2883. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.56 (UV, CAM).

Scheme 10. Synthesis of HyT31 (42)

Ketone **38** and Alcohol **39** were prepared by the reported procedure (*Bioorg. Med. Chem.*, **1998**, 6, 1309-1335).

Ketone 38: ^1H NMR (500 MHz, CDCl_3) δ 7.55 (d, $J = 7.9$ Hz, 1H), 7.44 (dd, $J = 2.6, 1.4$ Hz, 1H), 7.35 (t, $J = 7.9$ Hz, 1H), 7.10 (ddd, $J = 8.2, 2.7, 0.8$ Hz, 1H), 6.79-6.74 (m, 3H), 4.54 (s, 2H), 3.85 (s, 3H), 3.83 (s, 3H), 3.23 (t, $J = 8.0$ Hz, 2H), 2.98 (t, $J = 6.9$ Hz, 2H), 1.47 (s, 9H). ^{13}C NMR (125 MHz, CDCl_3) δ 198.8, 167.6, 158.1, 148.9, 147.4, 138.2, 133.8, 129.7, 121.4, 120.1, 120.0, 113.1, 111.8, 111.3, 82.6, 77.6, 65.6, 55.9, 55.8, 40.7, 29.8, 28.0.

Alcohol 39: ^1H NMR (500 MHz, CDCl_3) δ 7.26 (dd, $J = 8.2, 8.2$ Hz, 1H), 6.96 (d, $J = 7.7$ Hz, 1H), 6.93 (s, 1H), 6.81-6.78 (m, 2H), 6.74-6.71 (m, 2H), 4.68-4.65 (m, 1H), 4.52 (s, 2H), 3.86 (s, 3H), 3.85 (s, 3H), 2.72-2.66 (m, 1H), 2.64-2.58 (m, 1H), 2.12-2.04 (m, 1H), 2.02-1.95 (m, 1H), 1.83 (d, $J = 3.3$ Hz, 1H), 1.55 (s, 1H), 1.48 (s, 9H). ^{13}C NMR (100 MHz, CDCl_3) δ 168.0, 158.1, 148.8, 147.2, 146.4, 134.3, 129.6, 120.2, 119.1, 113.6, 112.2, 111.7, 111.2, 82.4, 77.2, 73.7, 65.6, 55.9, 55.8, 40.6, 31.6, 28.0. TLC (33% EtOAc in Hexanes), R_f 0.19 (UV, CAM).

tert-Butyl 2-(3-(((*S*)-1-(4-((3*S*,5*S*,7*S*)-adamantan-1-yl)phenoxy)-3-(3,4-dimethoxyphenyl)propyl) phenoxy)acetate 40: To a solution of alcohol **39** (48 mg, 0.1193 mmol), 4-(1-adamantyl)phenol (27 mg, 0.1193 mmol), and triphenylphosphine (35 mg, 0.1312 mmol) in THF (1.2 mL) at rt was added DIAD (26 μL , 0.1312 mmol). The resulting mixture was stirred at rt for 20 h, and diluted at rt with $\text{H}_2\text{O}/\text{EtOAc}$ (1:1, 5 mL). The mixture was extracted twice with ethyl acetate and the combined extracts were washed with brine, dried over Na_2SO_4 , filtered, and concentrated. The residue was chromatographed on silica gel to provide *tert*-Butyl 2-(3-(((*S*)-1-(4-((3*S*,5*S*,7*S*)-adamantan-1-yl)phenoxy)-3-(3,4-dimethoxyphenyl)propyl) phenoxy)acetate **40** (55 mg, 76%). ^1H NMR (400 MHz, CDCl_3) δ 7.23 (dd, $J = 7.9, 7.9$ Hz, 1H), 7.15 (d, $J = 8.8$ Hz, 2H), 6.95 (d, $J = 7.7$ Hz, 1H), 6.88 (s, 1H), 6.80-6.75 (m, 4H), 6.72 (ddd, $J = 8.2, 8.2, 1.8$ Hz, 1H), 6.62 (d, $J = 1.6$ Hz, 1H), 4.94 (dd, $J = 8.9, 4.0$ Hz, 1H), 4.48 (s, 2H), 3.85 (s, 3H), 3.65 (s, 3H), 2.80-2.72 (m, 2H), 2.29-2.20 (m, 1H), 2.05-1.96 (m, 4H), 1.82-1.69 (m, 11H), 1.45 (s, 9H). ^{13}C NMR (100 MHz, CDCl_3) δ 167.9, 158.1, 156.0, 148.5, 147.0, 144.3, 143.6, 133.9, 129.6, 125.6, 120.1, 119.0, 115.1,

113.2, 112.0, 111.9, 111.1, 82.3, 78.5, 77.2, 65.5, 55.8, 55.4, 43.2, 40.6, 36.7, 35.4, 31.5, 28.9, 27.9. LRMS (ES+) $[M+Na]^+$ 635.8, TLC (25% EtOAc in Hexanes), R_f 0.57 (UV, CAM).

2-(3-((S)-1-(4-((3S,5S,7S)-adamantan-1-yl)phenoxy)-3-(3,4-dimethoxyphenyl)propyl)phenoxy)acetic acid 41: To a stirred solution of *tert*-Butyl 2-(3-((S)-1-(4-((3S,5S,7S)-adamantan-1-yl)phenoxy)-3-(3,4-dimethoxyphenyl)propyl)phenoxy)acetate **40** (40 mg, 0.0653 mmol) in CH_2Cl_2 (2.0 mL) at 0 °C was added TFA (0.15 mL). The reaction mixture was stirred at 0 °C for 2.0 h and concentrated. The residue was chromatographed on silica gel to provide acid **41** (31 mg, 85%). 1H NMR (400 MHz, CD_3OD) δ 7.22 (dd, $J = 7.9, 7.9$ Hz, 1H), 7.13 (d, $J = 8.8$ Hz, 2H), 6.93-6.88 (m, 2H), 6.84 (d, $J = 8.1$ Hz, 1H), 6.78 (dd, $J = 8.2, 2.2$ Hz, 1H), 6.74 (d, $J = 8.8$ Hz, 2H), 6.71 (dd, $J = 8.2, 1.7$ Hz, 1H), 6.67 (d, $J = 1.7$ Hz, 1H), 4.97 (dd, $J = 8.8, 4.2$ Hz, 1H), 4.59 (s, 2H), 3.78 (s, 3H), 3.56 (s, 3H), 2.74 (t, $J = 7.6$ Hz, 2H), 2.22-2.15 (m, 1H), 2.03-1.96 (m, 4H), 1.84-1.79 (m, 6H), 1.78-1.71 (m, 6H). ^{13}C NMR (100 MHz, CD_3OD) δ 159.7, 157.4, 150.2, 148.6, 145.7, 144.9, 135.6, 130.7, 126.6, 121.7, 120.2, 116.4, 114.3, 113.7, 113.5, 113.2, 79.4, 56.5, 56.1, 44.5, 41.8, 37.8, 36.6, 32.5, 30.5. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.24 (UV, CAM).

2-(3-((S)-1-(4-((3S,5S,7S)-adamantan-1-yl)phenoxy)-3-(3,4-dimethoxyphenyl)propyl)phenoxy)-*N*-(24-chloro-11-oxo-3,6,9,15,18-pentaoxa-12-azatetracosyl)acetamide (HyT31, 42): **42** synthesized by the similar methods as **3**. 1H NMR (500 MHz, CD_3OD) δ 7.25 (dd, $J = 7.1, 7.1$ Hz, 1H), 7.15 (d, $J = 8.7$ Hz, 2H), 6.96 (d, $J = 6.8$ Hz, 2H), 6.84 (d, $J = 8.2$ Hz, 2H), 6.75 (d, $J = 8.8$ Hz, 2H), 6.71 (d, $J = 8.2$ Hz, 1H), 6.67 (d, $J = 1.4$ Hz, 1H), 5.00 (dd, $J = 8.9, 4.0$ Hz, 1H), 4.47 (d, $J = 3.2$ Hz, 2H), 3.92 (s, 2H), 3.77 (s, 3H), 3.59 (s, 3H), 3.56-3.50 (m, 18H), 3.43-3.36 (m, 6H), 2.76 (t, $J = 7.0$ Hz, 2H), 2.25-2.17 (m, 1H), 2.02-1.97 (m, 4H), 1.84-1.69 (m, 14H), 1.56-1.51 (m, 2H), 1.45-1.39 (m, 2H), 1.37-1.32 (m, 2H). ^{13}C NMR (125 MHz, CD_3OD) δ 172.7, 171.1, 159.5, 157.4, 150.4, 148.8, 145.9, 145.0, 135.8, 130.9, 126.7, 121.8, 120.7, 116.5, 114.8, 113.7, 113.5, 79.5, 72.2, 72.0, 71.4, 71.33, 71.31, 71.2, 71.1, 70.5, 70.4, 68.4, 56.7, 56.3, 45.7, 44.6, 41.8, 40.0, 39.8, 37.9, 36.6, 33.7, 32.5, 30.6, 30.5, 27.7, 26.5. HRMS (ES+) calculated for $C_{53}H_{76}N_2O_{11}Cl$ $[M+H]^+$ 951.5138, found 951.5142. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.68 (UV, CAM).

N-2-(2-(((6-chlorohexyl)oxy)ethoxy)ethyl)-4-pentylbicyclo[2.2.2]octane-1-carboxamide (HyT33,

43): HyT33 was synthesized by the same methods as HyT13 (**3**).

^1H NMR (400 MHz, CDCl_3) δ 6.01 (t, $J = 4.8$ Hz, 1H), 3.60-3.58 (m, 2H), 3.56-3.54 (m, 2H), 3.52 (t, $J = 6.5$ Hz, 4H), 3.45 (t, $J = 6.7$ Hz, 2H), 3.19 (t, $J = 5.3$ Hz, 2H), 1.80-1.73 (m, 2H), 1.72-1.68 (m, 6H), 1.63-1.56 (m, 2H), 1.49-1.41 (m, 2H), 1.40-1.34 (m, 8H), 1.30-1.23 (m, 2H), 1.20-1.12 (m, 4H), 1.09-1.03 (m, 2H), 0.86 (t, $J = 7.0$ Hz, 3H). ^{13}C NMR (100 MHz, CDCl_3) δ 178.2, 77.2, 71.2, 70.2, 69.9, 69.8, 45.0, 41.2, 39.0, 38.9, 32.7, 32.5, 30.6, 30.3, 29.4, 28.8, 26.6, 25.4, 23.3, 22.6, 14.0. HRMS (ES $^+$) calculated for $\text{C}_{24}\text{H}_{45}\text{NO}_3\text{Cl}$ $[\text{M}+\text{H}]^+$ 430.3088, found 430.3088. TLC (5% CH_3OH in CH_2Cl_2), R_f 0.51 (CAM).

Scheme 11. Synthesis of HyT34 (**44**)

To a solution of amine **8** (23 mg, 0.1 mmol) in CH_2Cl_2 (1.5 mL) at rt were triethylamine (140 μL , 1.0 mmol) and 1-adamantyl isocyanate (18 mg, 0.1 mmol). The reaction mixture was stirred at rt for 16 h, and evaporated. The residue was chromatographed on silica gel to give 1-(((3*s*,5*s*,7*s*)-adamantan-1-yl)-3-(2-(2-(((6-chlorohexyl)oxy)ethoxy)ethyl)urea) **44** (HyT34, 40

mg, 76%). ^1H NMR (400 MHz, CDCl_3) δ 4.81 (t, $J = 5.6$ Hz, 1H), 4.46 (s, 1H), 3.60–3.58 (m, 2H), 3.56–3.54 (m, 2H), 3.53 (t, $J = 6.7$ Hz, 2H), 3.52 (t, $J = 6.7$ Hz, 2H), 3.44 (t, $J = 6.7$ Hz, 2H), 3.31 (t, $J = 5.4$ Hz, 1H), 3.30 (t, $J = 5.4$ Hz, 1H), 2.04 (brs, 3H), 1.93 (t, $J = 2.8$ Hz, 6H), 1.79–1.72 (m, 2H), 1.64 (t, $J = 2.8$ Hz, 6H), 1.62–1.56 (m, 2H), 1.48–1.40 (m, 2H), 1.39–1.31 (m, 2H). ^{13}C NMR (100 MHz, CDCl_3) δ 157.4, 77.2, 71.2, 70.9, 70.2, 70.0, 50.7, 45.0, 42.4, 39.9, 36.4, 32.4, 29.5, 29.4, 26.6, 25.3. HRMS (ES+) calculated for $\text{C}_{21}\text{H}_{38}\text{N}_2\text{O}_3\text{Cl}$ $[\text{M}+\text{H}]^+$ 401.2571, found 401.2573. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.59 (CAM).

1-((3*s*,5*s*,7*s*)-Adamantan-1-yl)-3-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)thiourea (HyT35, 45):

HyT35 was synthesized by the same methods as HyT34 (44).

^1H NMR (500 MHz, CDCl_3) δ 6.20 (s, 1H), 3.76 (s, 2H), 3.63–3.60 (m, 3H), 3.55–3.49 (m, 5H), 3.45–3.38 (m, 2H), 2.14–1.93 (m, 9H), 1.77–1.72 (m, 2H), 1.69–1.63 (m, 6H), 1.59–1.54 (m, 2H), 1.48–1.39 (m, 2H), 1.38–1.30 (m, 2H). ^{13}C NMR (125 MHz, CDCl_3) δ 180.8, 77.2, 71.3, 70.4, 70.1, 53.8, 45.0, 42.4, 42.1, 42.0, 36.2, 32.5, 29.7, 29.6, 29.5, 26.8, 25.4. HRMS (ES+) calculated for $\text{C}_{21}\text{H}_{38}\text{N}_2\text{O}_2\text{SCl}$ $[\text{M}+\text{H}]^+$ 417.2343, found 417.2341. TLC (10% CH_3OH in CH_2Cl_2), R_f 0.58 (CAM).

Scheme 12. Synthesis of HyT36 (49)

(3*r*,5*r*,7*r*)-1-(2-iodoethyl)adamantine 46: To a stirred solution of PPh₃ (1.57 g, 6.0 mmol) in CH₂Cl₂ (14 mL) at rt were added imidazole (442 mg, 6.5 mmol) and iodine (1.52 g, 6.0 mmol). The reaction mixture was cooled to 0 °C and stirred at 0 °C for 5 min. A solution of 1-adamantane ethanol (901 mg, 5.0 mmol) in CH₂Cl₂ (6 mL) was added dropwise to the mixture via cannula. The resulting mixture was stirred at 0 °C for 2.0 h and H₂O (20 mL) was added to the mixture at ice-bath. The organic layer was separated and the aqueous phase was extracted twice with CH₂Cl₂. The combined organic layers were concentrated. The concentrate was purified by column chromatography to afford (3*r*,5*r*,7*r*)-1-(2-iodoethyl)adamantine **46** (1.375 g, 95%) as a white solid. ¹H NMR (400 MHz, CDCl₃) δ 3.17 (d, *J* = 17.9 Hz, 1H), 3.17 (dt, *J* = 3.2, 1.8 Hz, 1H), 1.95 (brs, 3H), 1.78 (d, *J* = 17.9 Hz, 1H), 1.78 (dt, *J* = 3.3, 1.8 Hz, 1H), 1.71 (brs, 1H), 1.68 (brs, 2H), 1.63-1.61 (m, 1H), 1.61-1.58 (m, 1H), 1.49 (d, *J* = 2.4 Hz, 1H). TLC (10% EtOAc in Hexanes), R_f 0.81 (UV, CAM).

(*R*)-4-((3*R*,5*R*,7*R*)-adamantan-1-yl)-*N*-((1*S*,2*S*)-1-hydroxy-1-phenylpropan-2-yl)-*N*,2-dimethyl butanamide 47: A solution of *n*-butyllithium (2.5 M in hexanes, 0.8 mL, 2.0 mmol, 4.0 eq.) was added to a suspension of lithium chloride (275 mg, 6.5 mmol, 13.0 eq.) and diisopropylamine (0.3 mL, 2.15 mmol, 4.3 eq.) in THF (2 mL) at -78 °C. The resulting suspension was warmed briefly to 0 °C, then was cooled to -78 °C. An ice-cooled solution of (1*S*,2*S*)-(+)-pseudoephedrine propionamide (221 mg, 1.0 mmol, 2.0 eq.) in THF (2 mL) was

added dropwise over 30 min via cannula and the reaction mixture was stirred at 78 °C for 1.0 h, at 0 °C for 15 min, and at room temperature for 5 min, and cooled to 0 °C. To this solution at 0 °C was added a solution of iodide **46** (145 mg, 0.5 mmol, 1.0 eq.) in THF (1 mL) via cannula, and the reaction mixture was stirred at 0 °C for 6 h and at room temperature for 20 h. The pale yellow mixture was cooled to 0 °C, then treated with half-saturated aqueous NH₄Cl solution (10 mL), and extracted with ethyl acetate (10 mL x 3). The combined organic layers were dried over Na₂SO₄, filtered, and concentrated. The residue was purified by flash chromatography on silica gel to afford (*R*)-4-((3*R*,5*R*,7*R*)-adamantan-1-yl)-*N*-((1*S*,2*S*)-1-hydroxy-1-phenylpropan-2-yl)-*N*,2-dimethylbutanamide **47** (178 mg, 93%). ¹H NMR (400 MHz, CDCl₃) δ 7.38-7.30 (m, 5H), 4.62 (dd, *J* = 7.3, 7.3 Hz, 1H), 4.35 (brs, 1H), 2.81 (s, 3H), 2.50-2.41 (m, 1H), 1.93 (s, 3H), 1.71-1.60 (m, 7H), 1.57-1.41 (m, 8H), 1.17 (d, *J* = 7.0 Hz, 3H), 1.08 (d, *J* = 6.7 Hz, 3H), 0.98-0.87 (m, 2H). ¹³C NMR (100 MHz, CDCl₃) δ 179.3, 142.7, 128.7, 128.3, 127.5, 126.9, 126.3, 77.2, 76.5, 42.3, 42.2, 37.4, 37.2, 32.1, 28.7, 26.9, 17.2, 15.4. TLC (33% EtOAc in Hexanes), R_f 0.24 (UV, CAM).

(*R*)-4-((3*R*,5*R*,7*R*)-adamantan-1-yl)-2-methylbutanoic acid **48**: To a solution of (*R*)-4-((3*R*,5*R*,7*R*)-adamantan-1-yl)-*N*-((1*S*,2*S*)-1-hydroxy-1-phenylpropan-2-yl)-*N*,2-dimethylbutanamide **47** (120 mg, 0.313 mmol) in 1,4-dioxane (3 mL) and H₂O (2 mL) at rt was added *n*-Bu₄NOH (40% wt % in H₂O, 1.22 mL, 1.878 mmol). The reaction mixture was stirred at 110 °C for 20 h, cooled to rt, and evaporated. The residue was diluted with H₂O (2 mL), cooled to 0 °C, adjusted to pH 4 with 3N-HCl. The mixture was extracted twice with ethyl acetate and the combined extracts were washed with brine, dried over Na₂SO₄, filtered, and concentrated. The residue was chromatographed on silica gel to afford acid **48** (73 mg, quant.). ¹H NMR (400 MHz, CDCl₃) δ 10.8 (brs, 1H), 2.41-2.32 (m, 1H), 1.93 (brs, 3H), 1.71-1.60 (m, 7H), 1.46 (d, *J* = 2.0 Hz, 6H), 1.42-1.34 (m, 1H), 1.18 (d, *J* = 7.0 Hz, 3H), 1.11-1.03 (m, 2H). ¹³C NMR (100 MHz, CDCl₃) δ 183.5, 42.3, 41.7, 40.0, 37.2, 32.1, 28.7, 26.5, 16.8. TLC (33% EtOAc in Hexanes), R_f 0.62 (CAM).

(*R*)-4-((3*R*,5*R*,7*R*)-adamantan-1-yl)-*N*-(2-(2-((6-chlorohexyl)oxy)ethoxy)ethyl)-2-methylbutanamide (HyT36, **49**): HyT36 was synthesized by the EDC-mediated coupling method as HyT13.

^1H NMR (400 MHz, CDCl_3) δ 5.93 (s, 1H), 3.62-3.59 (m, 2H), 3.57-3.55 (m, 2H), 3.54 (t, J = 5.0 Hz, 2H), 3.52 (t, J = 6.5 Hz, 2H), 3.47-3.43 (m, 4H), 2.09-2.01 (m, 1H), 1.92 (s, 3H), 1.79 (t, J = 6.7 Hz, 1H), 1.75 (t, J = 6.7 Hz, 1H), 1.69-1.57 (m, 9H), 1.47-1.27 (m, 11H), 1.12 (d, J = 6.8 Hz, 3H), 1.03-0.98 (m, 2H). ^{13}C NMR (100 MHz, CDCl_3) δ 176.6, 71.2, 70.2, 70.0, 44.9, 42.4, 42.2, 42.1, 38.9, 37.2, 32.5, 32.1, 29.4, 28.7, 27.2, 26.6, 25.4, 17.8. HRMS (ES+) calculated for $\text{C}_{25}\text{H}_{45}\text{NO}_3\text{Cl}$ $[\text{M}+\text{H}]^+$ 442.3088, found 442.3086. TLC (5% CH_3OH in CH_2Cl_2), R_f 0.40 (CAM).

HyT39 was synthesized by the same methods as HyT36.

Scheme 13. Synthesis of HyT39 (**53**)

N-((1*S*,2*S*)-1-hydroxy-1-phenylpropan-2-yl)-*N*-methyl-3-phenylpropanamide **50**: To a solution of (1*S*,2*S*)-(+)-pseudoephedrine (496 mg, 3.0 mmol) in THF (9 mL) at rt was added triethylamine (0.59 mL, 4.2 mmol). The mixture was cooled to 0 °C, and hydrocinnamoyl chloride (0.54 mL, 3.6 mmol) was added to the mixture. The resulting mixture was stirred at 0 °C for 0.5 h, quenched with H₂O (10 mL), and extracted twice with ethyl acetate. The combined extracts were washed with brine, dried over Na₂SO₄, filtered, and concentrated. The residue was chromatographed on silica gel to afford *N*-((1*S*,2*S*)-1-hydroxy-1-phenylpropan-2-yl)-*N*-methyl-3-phenylpropanamide **50** (865 mg, 97%). ^1H NMR (500 MHz, CD_3OD) δ 7.38-7.31 (m, 4H), 7.29-7.13 (m, 6H), 4.77 (brs, $\frac{1}{2}$ H), 4.58 (dd, J = 11.2, 8.2 Hz, 1H), 4.03-3.97 (m, $\frac{1}{2}$ H), 2.88 (d, J = 10.7 Hz, 3H), 2.87 (t, J = 8.1 Hz, 2H), 2.76-2.58 (m,

Biological Experiments

Methods

Cell culture and materials

Indicated cells were grown at 37°C in DMEM, supplemented with 10% fetal bovine serum and penicillin/streptomycin. The HaloTag protein was obtained from pHT2 vector (Promega). The luciferase sequence was obtained from pGL3-Basic vector (Promega), mouse Ror2 was kindly provided by Sigmar Stricker (Max Planck-Institute for Molecular Genetics), *Danio rerio* Smad5 was cloned from a zebrafish cDNA library and H-RasG12V was obtained from Addgene plasmid 9051, contributed by Robert Weinberg (MIT). The remaining transmembrane proteins were cloned from a human spleen cDNA library (Invitrogen). A D106A point mutation was introduced into the HaloTag gene by the QuikChange Site Directed mutagenesis kit (Stratagene). Flp-In 293 cells were purchased from Invitrogen. HA-HaloTag-Smad5 and EGFP-HaloTag were cloned into the pCS2+ vector, while the rest

of the constructs were cloned into a retroviral pEYK3.1 vector (kindly provided by George Daley, MIT) by excising GFP⁴¹. Retrovirus was generated in GP2-293 cells (Clontech) with a pVSV-G and a corresponding pEYK plasmid, and the indicated cells were infected as described⁴¹. Anti-HA antibody was purchased from Covance (clone 16B12) and anti- β -actin antibody was purchased from Sigma (clone AC-74). HyT compounds were stored and aliquoted in DMSO as 1000x stock solutions.

Luciferase assay

Ten thousand stable HEK 293T cells infected with HA-luciferase-HaloTag were plated into each well in a 96-well plate. The next day, indicated HyT compounds were added in triplicate and the cells were cultured for another 24 hours. The cells were washed once with cold PBS and lysed in Passive Lysis Buffer (Promega). The luciferase activity was performed by Steady-Glo Luciferase Assay System (Promega) on a Wallac Victor 2 Plate Reader (Perkin Elmer) and the luciferase activity was normalized by protein concentration, as determined by the Bradford assay.

Immunoblotting

The indicated cells were washed twice with cold PBS and the cells were lysed in lysis buffer (1x PBS, 1% NP-40, 1 mM EDTA, 40 mM HEPES) with protease inhibitors. The lysates were cleared by centrifugation at 10,000 g for 5 min. The total protein concentration was determined by Bradford assay and 50 μ g of protein was loaded onto an 8% Bis-Tris gel. To solubilize polyubiquitinated and aggregated proteins upon proteasome inhibition⁴² samples generated for Fig. 12e were lysed with a SDS lysis buffer (1x PBS, 1% NP-40, 1% SDS, 1% sodium deoxycholate, 1 mM EDTA, 40mM HEPES) with protease inhibitors. The blots were processed by standard procedures with indicated antibodies, and the band intensities were quantified by ImageJ.

Flow cytometry analysis

Stable HeLa cells were raised by cotransfection of pCS2/EGFP-HaloTag and p-Puro containing the puromycin resistance gene. A clonal population of cells expressing EGFP-

HaloTag was isolated. These cells were treated with vehicle or 1 μ M HyT13 for 24 hours, washed with PBS and trypsinized. The cells were resuspended in FBS-free DMEM and the intracellular GFP level was measured by FACSCalibur (BD Biosciences).

Zebrafish *Danio rerio* experiments

The wild-type fish line TLF was used for this study. The HA-HaloTag-Smad5 in pCS2+ plasmid was *in vitro* transcribed with the SP6 transcription kit (Ambion). The mRNA was injected at 100 ng/ μ L at the one cell stage and embryos were raised to the 256-cell stage, when they were moved to glass depression slides (10-per-well) and put in 1 ml E2 media with or without HyT13 (10 μ M). Embryos were cultured at 28.6°C for 24 hours and then dechorionated and de-yolked as described⁴³. Approximately 60 embryos per condition were collected for immunoblot analysis, as described above.

Focus formation assay

One hundred thousand NIH-3T3 cells infected with HA-HaloTag-H-RasG12V and HA-HaloTag(D106A)-H-RasG12V were plated onto 10-cm cell culture plates in 10% FBS with DMEM. The next day, the media was replaced with 1% FBS media and the cells were administered either vehicle or 1 μ M HyT13. The media and the drug were replaced every two days. On day 6, the foci were photographed and counted as the number of distinct foci per 1-cm² area.

Tumor formation assay

One hundred thousand NIH-3T3 cells expressing HA-HaloTag-H-RasG12V were injected into the flank of anesthetized 6-week old female *nu/nu* nude mice (Charles River Laboratories). Two hours later, the mice were IP injected with either vehicle (10 μ L volume, with 5 μ L DMSO and 5 μ L of Cremophor EL), 25 mg/kg HyT13 or 100 mg/kg HyT13. The drug injections continued daily until the end of the experiment. Upon the appearance of tumors on day 7, the tumors were measured daily with calipers, and their volumes were calculated using the formula: $a(b)^2 / 2$, where a and b represent the longest and shortest diameters of the tumor, respectively.

Results

Hydrophobic tagging destabilizes HaloTag fusion proteins

The inventors designed 21 structurally distinct scaffolds as the basis for our hydrophobic Tags (HyTs), and synthesized and tested 30 compounds across these scaffolds composed of hydrophobic moieties linked to the HaloTag haloalkane reactive linker (Table 1, Figure 5). In designing the hydrophobic portion of these bifunctional molecules, the inventors used the compound library available in the Yale University Small Molecule Discovery Center as an informal resource to identify compounds that (1) maximized hydrophobicity, (2) minimized molecular weight, and (3) incorporated chemically diverse and commercially available scaffolds. To determine their biological activity, we generated a stable HEK 293T cell line expressing a luciferase-HaloTag fusion protein and treated these cells with the HyT compounds at 1 μ M for 24 hours. Remarkably, several non-toxic compounds appeared to reduce luciferase activity and we characterized the five most potent compounds further (**Fig. 1**). All five HyTs exhibited high hydrophobicity scores (logP ranging from +3 to +5) and were active in a concentration-dependent manner, whereas the HyT5 control compound with two PEG groups did not decrease the luciferase activity (**Fig. 1**). Based on these initial data, we continued our investigation of hydrophobic tagging-induced degradation with hydrophobic containing HyT13 because of the reported high stability and cell permeability of compounds bearing adamantyl groups^{27,28}.

As the luciferase assay relied on the loss-of-activity of the luciferase-HaloTag fusion protein, we wanted to determine whether the decrease in luciferase activity resulted from the degradation of the entire fusion protein or perhaps simply inhibition of luciferase activity. We generated a stable Flp-In 293 cell line with a single integration site containing HA-EGFP-HaloTag fusion protein, and employed this cell line to perform kinetic studies with HyT13. Immunoblotting showed that HyT13 efficiently degraded the fusion protein, with a maximal effect achieved at 100 nM (**Fig. 12a**). The IC₅₀ of HyT13 was determined to be 21 nM (**Fig. 6**). A time course experiment revealed that the full effect is reached within 8 hours, with 50% degradation observed by 1.5 hours (**Fig. 12b** and **Fig. 7**). When cells were treated with 1 μ M HyT13 for 24 hours, and then the HyT13 was removed for 24 hours, the protein level recovered to half the starting levels. No cellular toxicity was observed at 20 μ M of HyT13, a dose of 1000-fold over the IC₅₀ value (**Fig. 8**). Consistent with our hypothesis that

hydrophobic tagging mimics a partially denatured protein state and that the protein is ultimately delivered to the proteasome for degradation, inclusion of proteasome inhibitors MG132 and YU101²⁹ blocked HyT13 mediated degradation (**Fig. 12c**). To verify that the observed decrease in HA-EGFP-HaloTag levels does not result from masking of the HA epitope during immunoblotting, we generated a HeLa cell line stably expressing EGFP-HaloTag and analyzed the intracellular fluorescence by flow cytometry. Consistent with our previous observations, treatment of these cells with 1 μ M of HyT13 for 24 hours reduced the mean fluorescence intensity of cells almost 7-fold (**Fig. 12d**). Together, these findings provide the first experimental evidence that hydrophobic tagging represents a viable strategy for the control of protein levels.

Degradation of transmembrane and zebrafish proteins

One limitation of existing technologies for small molecule control of protein levels has been the difficulty of degrading transmembrane proteins⁹. To determine if hydrophobic tagging shares this limitation, we constructed several transmembrane-HA-HaloTag fusion proteins, such that the HaloTag portion would be intracellular. Ror2 is a single-pass receptor tyrosine kinase-like orphan receptor, which functions in Wnt ligand signaling³⁰. Likewise, CD3E is a single-pass cell surface glycoprotein involved in antigen recognition³¹. CD9 is a 4-pass transmembrane protein from the tetraspanin family and it functions in integrin signaling³². Finally, G-protein coupled receptors GPR40 and Frizzled-4 are 7-pass transmembrane receptors for long-chain free fatty acids and Wnt proteins, respectively^{33,34}. Treatment of HEK 293T cell lines stably expressing these transmembrane HaloTag fusion proteins with HyT13 efficiently induced their degradation (**Fig. 12e**), demonstrating the potential of our hydrophobic tagging system to degrade transmembrane proteins. These experiments show that fusions to either the amino or carboxy terminus of the HaloTag protein are susceptible to this small molecule-induced degradation strategy and that transmembrane proteins can be degraded by HyT13.

We also explored the possibility of employing the hydrophobic tagging system in the zebrafish *Danio rerio*. We injected HA-HaloTag-Smad5 cRNA into zebrafish embryos and then treated the embryos with either vehicle or HyT13. Immunoblotting of injected embryo lysates revealed that the fusion protein is very efficiently degraded, demonstrating that HyT13 is able to penetrate the chorion and can direct the HaloTag fusion proteins for degradation in zebrafish (**Fig. 12f**). These experiments show that HyT13 is capable of degrading fusion proteins in various cell lines, as well as in zebrafish embryos.

HyT13 suppresses HaloTag-RasG12V tumor burden in mice

We next explored the functional utility of HaloTag-based degradation of an oncogene by HyT13 both in cell culture and in mice. The small GTPase H-Ras is one of the most commonly mutated genes in cancer, with up to 90% of cancers harboring activating mutations in this gene³⁵. Activating mutations, such as the H-RasG12V allele, lead to decreased dependence on extracellular mitogenic signals. Ectopic expression of H-RasG12V in mouse fibroblast cell line NIH-3T3 can lead to a transformed phenotype, as demonstrated

by assays in cell culture and in mice. When H-RasG12V expressing cells are grown in culture under low serum conditions they lose cell-to-cell contact inhibition and form distinct foci instead of growing as a cellular monolayer. Furthermore, these transformed cells are capable of tumor formation when injected into immuno-compromised nude mice^{36,37}. We investigated whether (1) HaloTag-H-RasG12V driven focus formation can be suppressed in NIH-3T3 cells and (2) HaloTag-H-RasG12V driven tumor burden in mice can be reduced by administration of HyT13. First, NIH-3T3 cells were stably infected with a HA-HaloTag-H-RasG12V retroviral construct. The encoded fusion protein was readily degraded with HyT13 (**Fig. 13a**). To test the HaloTag receptor specificity for HyT13, we generated a point mutation in the HaloTag protein (HaloTagD106A) that is unable to form a covalent bond with the reactive chloroalkane in HyT13²⁶. Unlike HA-HaloTag-H-RasG12V, HA-HaloTag(D106A)-H-RasG12V fusion protein was unaffected by HyT13 (**Fig. 13a**). Next, we plated both cell lines sparsely (10^5 cells/10-cm plate) in 10% FBS containing media. The next day, the media was replaced with 1% FBS containing media and the cultures were treated with either vehicle or HyT13. By day 6, both vehicle-treated cell lines and HyT13-treated HA-HaloTag(D106A)-H-RasG12V expressing cells had formed many foci, whereas HA-HaloTag-H-RasG12V expressing cells treated with HyT13 had grown a normal monolayer of cells, much like the parental NIH-3T3 cells (**Fig. 13b-c**). In the absence of HyT13, HA-HaloTag-H-RasG12V expressing cells exhibited slightly higher number of colonies than HA-HaloTag(D106A)-H-RasG12V cells. However, we attribute this observation to slight differences in retroviral infection efficiencies, since we have observed instances where the HaloTag(D106A)-H-RasG12V cells exhibit more colonies than the HA-HaloTag-H-RasG12V cells as well (data not shown). These results demonstrate that hydrophobic tagging can be used to reduce protein activity in the context of *in vitro* cell culture.

To examine whether the HaloTag:HyT13 based system could be used in mouse models to relieve the H-RasG12V-driven tumor burden, we first evaluated the pharmacokinetics of HyT13. We performed a maximum tolerated dose experiment with HyT13 in nude mice at doses up to 100 mg/kg over a 14-day treatment regimen. No obvious phenotype was observed even at the highest dose (**Fig. 9**). Next, we sought to determine the serum bioavailability of HyT13 following injections. HyT13 was administered at 25 mg/kg by intraperitoneal (IP) injection into Swiss Webster mice and the serum was collected at 1 and 24 hours post-injection. At 1 hour post HyT13 administration the blood serum

concentration was approximately 2 μ M, and by 24 hours the HyT13 concentration had dropped to about 500 nM (**Fig. 10**). Based on our previous experiments in a cell culture setting, we speculated that these serum HyT13 concentrations would be sufficient to suppress H-RasG12V tumor formation in mice. To test this, we injected NIH-3T3 cells expressing HA-HaloTag-H-RasG12V into the flank of nude mice and on the same day started a daily treatment regimen of vehicle, 25 mg/kg HyT13 or 100 mg/kg HyT13. Obvious solid tumor masses were observed on day 9 in vehicle-treated mice and the tumor volume grew exponentially until day 13, when the animals were sacrificed. The tumors in HyT13 mice were on average 6 times smaller than in vehicle treated mice, suggesting that HyT13 was able to reduce H-RasG12V tumor formation (**Fig. 13d**). These data clearly demonstrate the utility of the HaloTag:HyT13 system in perturbing protein function in live animals.

Discussion

The present invention relates to a novel hydrophobic tagging technology to systematically degrade levels of a specific protein upon addition of a small molecule (**Fig. 9**). This strategy has several benefits over the existing technologies. First, protein degradation is achieved upon compound administration as opposed to following ligand withdrawal. This aspect is particularly relevant when a protein needs to be expressed for long periods before the study, as there is no continuous ligand treatment necessary to maintain expression of the POI. In contrast, DD-based methods (see Introduction) of controlling protein abundance require constant drug administration, which can be both time-consuming and expensive. Also, there are likely fluctuations in the concentration of the fusion protein between ligand administrations using the DD-based system, whereas the expression of the HaloTag fusion protein is stable in the absence of the degradation signal. Therefore, depending on the application, it can be desirable to have a system where the small molecule induces degradation, rather than stabilization, of the POI. Second, our HaloTag:HyT13 method relies on the single introduction of a fusion domain to the POI. This feature contrasts with the auxin system, where an exogenous plant E3 ligase must be expressed in addition to the fusion protein. Third, almost all human and mouse genes are commercially available as both N- and C-terminal HaloTag fusions in transient and lentiviral expression vectors. These protein fusions with the 34 kDa HaloTag receptor are proving useful in many studies of protein function since they can be readily labeled *in vivo* and purified using fluorescent or

biotinylated HaloTag reagents. The ability to degrade these fusion proteins with the hydrophobic tag HyT13 only adds to the repertoire of possible HaloTag applications. Although HyT13 is not yet commercially available, this small molecule can be obtained using standard synthetic methods in four steps from commercially available starting materials with an overall yield of 63% (**Scheme 2**, above).

One of the criticisms that surround the several FKBP12 based degradation systems is their reliance on either rapamycin, FK506 or their derivatives to cause protein perturbation. Since these are bioactive small molecules, they could induce biological effects unrelated to perturbing the POI. In contrast, HaloTag dehalogenase is a bacterial gene and covalent binding of HyT13 to HaloTag affords this system a high degree of specificity. This bioorthogonality may explain the lack of noticeable HyT13 cytotoxicity even upon 1,000-fold administration over its IC₅₀ value of 21 nM in cell culture. Moreover, mice injected daily with HyT13 at 100 mg/kg for 14 days gained weight normally, suggesting that HyT13 possesses no *in vivo* toxicity even at this high dose.

Like several other systematic degradation methods, the HaloTag:HyT13 methodology is not able to degrade endogenous proteins unless the HaloTag gene is fused with the gene of interest. However, there are two viable strategies to overcome this limitation and subject endogenous proteins to HaloTag:HyT13-mediated regulation in culture or live animals. First, it is possible to generate HaloTag fusion constructs via targeted genome engineering. Recent advances in zinc finger nucleases^{20,38,39} and homologous recombination⁴⁰ technologies open the possibility of systematically tagging endogenous proteins in rodents in a manner similar to yeast. The second approach would be to inactivate the endogenous gene by knockdown or knockout techniques and introduce the corresponding HaloTag fusion gene into the animal. Both approaches should be amenable to bypassing an early requirement of an essential gene, thus allowing the study of its function later during organogenesis or disease development.

In summary, herein we describe a chemical biology approach to systematically degrade any POI in either cell culture or whole animals. The system requires construction of a single fusion protein, which is specifically degraded by the addition of a non-toxic, low-molecular weight hydrophobic tag. We believe this system is particularly amenable to animal studies, as we have shown here with experiments in zebrafish and mice. Additionally, our

findings suggest that hydrophobic tagging represents a novel approach to promote targeted degradation of endogenous proteins independent of the HaloTag:HyT13 system.

Claims:

1. A compound according to the formula:

Where  is a hydrophobic group having a ClogP of at least about 1.5 or a hydrophobic group as depicted in figure 14 hereof; and

is a linker group having a reactive moiety which reacts with an self-labeling polypeptide tag on a fusion protein comprising said self-labeling tag and a protein of interest

to form a covalent link between said  group and said fusion protein, wherein said hydrophobic group promotes the intracellular degradation of said protein of interest in said

fusion protein covalently linked to said  group.

2. The compound according to claim 1 wherein said hydrophobic group is other than a reporter group.

3. The compound according to claim 1 wherein said hydrophobic group is other than a fluorescent reporter group.

4. The compound according to any of claims 1-3 wherein said self-labeling polypeptide tag is a haloalkane dehalogenase (halotag2 or halotag7) self-labeling polypeptide tag (SEQ ID NO:1 or SEQ ID NO:2).

5. The compound according to any of claims 1-3 wherein said self-labeling polypeptide tag is selected from the group consisting of snaptag (SEQ ID NO:3, SEQ ID NO:4, SEQ ID NO:5, SEQ ID NO:6), cliptag (SEQ ID NO:7), ACPTag (SEQ ID NO:8, SEQ ID NO:9) and MCPtag (SEQ ID NO:10).

6. The compound according to claim 4 wherein said reactive group is a haloalkyl group which is optionally substituted with a monoether or diether group.

7. The compound according to claim 6 wherein said haloalkane is a C₂-C₁₂ chloroalkyl group optionally substituted with a monoether or diether group.

8. The compound according to claim 6 wherein said reactive group is

9. The compound according to claim 5 wherein said self-labeling tag is a O⁶-alkylguanine-DNA alkyltransferase that reacts specifically with benzylguanine (BG) derivatives (SEQ ID NO:3, SEQ ID NO:4, SEQ ID NO:5, SEQ ID NO:6).

10. The compound according to claim 9 wherein said reactive group is

11. The compound according to claim 5 wherein said self-labeling tag is a O⁶-alkylguanine-DNA alkyltransferase that reacts specifically with benzylcytosine (BC) derivatives (cliptag).

12. The compound according to claim 9 wherein said reactive group is

13. The compound according to claim 5 wherein said self-labeling tag is a phosphopantetheinyl transferase AcpS (SCP synthase) that reacts specifically with Coenzyme A derivatives (ACPtag, SEQ ID NO: 8 or SEQ ID NO: 9).

14. The compound according to claim 5 wherein said self-labeling tag is a phosphopantetheinyl transferase Sfp (Sfp synthase) (SEQ ID NO:10) that reacts specifically with Coenzyme A derivatives.

15. The compound according to claim 13 or 14 wherein said reactive group is

16. A compound according to the chemical structure:

Where HYD is a hydrophobic group;

Z is a group which links HYD to X;
 X is a group linking Z to group Y_R ; and
 Y_R is a group which is reactive with a fusion protein which forms a covalent bond connecting the hydrophobic group and the fusion protein.

17. The compound according to claim 16 wherein said hydrophobic group has a ClogP of at least about 1.5.

18. The compound according to claim 16 wherein said hydrophobic group is a group from figure 14 hereof.

19. The compound according to claim 16 wherein Z is a bond, $-(\text{CH}_2)_i\text{-O}$, $-(\text{CH}_2)_i\text{-S}$, $-(\text{CH}_2)_i\text{-N-R}$, a $(\text{CH}_2)_i\text{-X}_1\text{Y}_1$ group wherein X_1Y_1 forms an amide group, or a urethane group, ester or thioester group, or a

Each R is H, or a $\text{C}_1\text{-C}_3$ alkyl or alkanol group;

Each Y is independently a bond, O, S or N-R;

and each i is independently 0 to 100;

Where each D is independently a bond (absent),

j is 1 to 100;

k is 1 to 100;

m' is 1 to 100;

n is 1 to 100;

X¹ is O, S or N-R;

Y is the same as above; and

CON is a bond (absent) or a

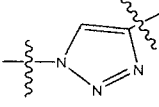

Where X² is O, S, NR⁴, S(O), S(O)₂, -S(O)₂O, -OS(O)₂, or OS(O)₂O;

X³ is O, S, NR⁴; and

R⁴ is H or a C₁-C₃ alkyl group, or

a pharmaceutically acceptable salt, enantiomer or stereoisomer thereof.

20. The compound according to claim 19 wherein **CON** is a  group or an amide group.

21. The compound according to claim 19 wherein Y_R is a group reactive with a self-labeling tag of said fusion protein.

22. The compound according to claim 21 wherein said self-labeling tag is halotag 2 or 7 (SEQ ID NO:1, SEQ ID NO:2), snaptag (SEQ ID NO:3, SEQ ID NO:4, SEQ ID NO:5, SEQ ID NO:6), cliptag (SEQ ID NO:7), ACPtag (SEQ ID NO:8, SEQ ID NO:9) or MCPtag (SEQ ID NO:10).

23. The compound according to claim 21 wherein Y_R is

24. The compound according to claim 19 wherein Y_R is

25. The compound according to claim 19 wherein said hydrophobic group has a ClogP of at least about 1.5.

26. The compound according to claim 19 wherein said hydrophobic group is a group from figure 14 hereof.

27. A compound HyT according to figure 4 hereof.

28. A compound according to the structure:

Where  is a hydrophobic group;

Z is a group which links  to X;

X is a group linking Z to group Y_{Rp} ;

 is a fusion protein comprising a protein of interest and a self-labeling polypeptide tag linked to said protein of interest in said fusion protein, said self-labeling

polypeptide tag being reactive with a reactive group Y_R to covalently link said **HYD** group to said fusion protein; and

Y_{Rp} is a chemical moiety formed by the action of the fusion protein on said reactive group Y_R which links the fusion protein to said hydrophobic group through said X group and said Z group.

29. The compound according to claim 28 according to the chemical structure:

Where (HYD), Z, X and Fusion Protein are as described in claim 28 and X_{Fp} is a N, O or S group from the fusion protein through which the reactive YR covalently binds to the fusion protein.

30. The compound according to claim 28 or 29 wherein said hydrophobic group has a ClogP of at least about 1.5.

31. The compound according to any of claims 28-30 wherein said hydrophobic group is a group from figure 14 hereof.

32. The compound according to any of claims 28-31 wherein Z is a bond, -(CH₂)_i-O,

-(CH₂)_i-S, -(CH₂)_i-N-R, a $\left(\text{CH}_2\right)_i\text{-X}_1\text{Y}_1$ group wherein X₁Y₁ forms an amide group, or a urethane group, ester or thioester group, or a

Each R is H, or a C₁-C₃ alkyl or alkanol group;

Each Y is independently a bond, O, S or N-R;

and each i is independently 0 to 100; and

Where each D is independently a bond (absent),

j is 1 to 100;

k is 1 to 100;

m' is 1 to 100;

n is 1 to 100;

X¹ is O, S or N-R;

Y is the same as above; and

CON is a bond (absent) or a

Where X² is O, S, NR⁴, S(O), S(O)₂, -S(O)₂O, -OS(O)₂, or OS(O)₂O;

X³ is O, S, NR⁴; and

R⁴ is H or a C₁-C₃ alkyl group, or

a pharmaceutically acceptable salt, enantiomer or stereoisomer thereof.

33. The compound according to any of claims 31 or 32 wherein **CON** is a

34. The compound according to any of claims 28-33 wherein said self-labeling tag is halotag 2 or 7 (SEQ ID NO:1, SEQ ID NO:2), snaptag (SEQ ID NO:3, SEQ ID NO:4, SEQ ID NO:5, SEQ ID NO:6), cliptag (SEQ ID NO:7), ACPtag (SEQ ID NO:8, SEQ ID NO:9) or MCPtag (SEQ ID NO:10).

35. The compound according to any claim 28-34 wherein said protein of interest is a structural protein, receptor, enzyme, cell surface protein, a protein involved in catalytic activity, aromatase activity, motor activity, helicase activity, metabolic processes, antioxidant activity, proteolysis, biosynthesis, kinase activity, oxidoreductase activity, transferase

activity, hydrolase activity, lyase activity, isomerase activity, ligase activity, enzyme regulator activity, signal transducer activity, structural molecule activity, binding activity, cell motility, membrane fusion, cell communication, regulation of biological processes, development, cell differentiation, response to stimulus, behavioral proteins, cell adhesion proteins, proteins involved in cell death, protein transporter activity, nuclear transport, ion transporter activity, channel transporter activity, carrier activity, permease activity, secretion activity, electron transporter activity, pathogenesis, chaperone regulator activity, nucleic acid binding activity, transcription regulator activity, extracellular organization and biogenesis activity or translation regulator activity.

36. The compound according to any of claims 28-35 wherein said protein of interest is a eukaryotic protein.

37. The compound according to any of claims 28-35 wherein said protein of interest is a prokaryotic protein.

38. A method of determining whether a protein of interest is a potential target of a bioactive agent or a drug target comprising the steps of:

a. Providing a hydrophobically labeled fusion protein wherein said fusion protein comprises said protein of interest and a hydrophobic moiety covalently linked to said fusion protein wherein said hydrophobic moiety is capable of degrading said fusion protein intracellularly or on the surface of cells;

b. Exposing cells which utilize said protein of interest to said hydrophobically labeled fusion protein, wherein said fusion protein is optionally labeled with the hydrophobic moiety within or on the surface of said cells;

c. Measuring the degradation of the fusion protein in or on the surface of the cells;

and

d. Determining if the degradation of the fusion protein modulates the biological activity of the cells through a change in a phenotypic response of the cells consistent with the protein being a potential target for a bioactive agent or drug for a disease and/or condition modulated through said protein of interest.

39. The method according to claim 38 wherein said fusion protein is expressed within or on the surface of said cells which utilize said protein of interest.

40. A method of determining whether a protein of interest is a potential bioactive agent target or drug target comprising the steps of :

1. Providing a fusion protein comprising a protein of interest and a polypeptide self-labeling tag by expressing said fusion protein in a population of cells;
2. Optionally, isolating said fusion protein;
3. Optionally, exposing a population of cells which utilize said protein of interest to said isolated fusion protein;
4. Covalently linking said fusion protein to a compound comprising a hydrophobic group and a reactive linker intracellularly or on the surface of cells, wherein the reactive linker has a reactive group which is a substrate for the self-labeling tag wherein said hydrophobic group becomes covalently linked to said fusion protein, thus producing a hydrophobically labeled fusion protein intracellularly or on the cell surface;
5. Measuring the degradation of said fusion protein in or on the surface of said cells; and
6. Optionally determining if said degradation of said fusion protein modulates biological activity of said cells through a change in a phenotypic response of the cells consistent with the protein of interest being a potential target for a bioactive agent or drug for a disease and/or condition modulated through said protein of interest.

41. A method of determining whether a protein of interest is a potential bioactive agent target or drug target comprising the steps of :

1. Providing a fusion protein comprising a protein of interest and a polypeptide self-labeling tag by expressing said fusion protein in a population of cells which utilize said protein of interest;
2. Covalently linking said fusion protein to a compound comprising a hydrophobic group and a reactive linker within said cells, wherein the reactive linker has a reactive group which is a substrate for the self-labeling tag wherein said hydrophobic group becomes covalently linked to said fusion protein, thus producing a hydrophobically labeled fusion protein within or on the surface of said cells;
3. Measuring the degradation of said fusion protein in or on the surface of said cells; and
4. Optionally determining if said degradation of said fusion protein modulates biological activity of said cells through a change in a phenotypic response of the cells consistent with the protein of interest being a potential target for a bioactive agent or drug for a disease and/or condition modulated through said protein of interest.

42. The method according to claim 40 or 41 wherein said self-labeling polypeptide tag is a halotag 2 or 7 (SEQ ID NO:1, SEQ ID NO:2), snaptag (SEQ ID NO:3, SEQ ID NO:4, SEQ ID NO:5, SEQ ID NO:6), cliptag (SEQ ID NO:7), ACPtag (SEQ ID NO:8, SEQ ID NO:9) or MCPtag (SEQ ID NO:10).

43. The method according to any of claims 38-42 wherein said hydrophobic group is other than a reporter group.

44. The method according to any of claims 38-42 wherein said hydrophobic group is other than a fluorescent reporter group.

45. The method according to any of claims 40-44 wherein said self-labeling polypeptide tag is a haloalkane dehalogenase (halotag1 or halotag2) self-labeling polypeptide tag (SEQ ID NO:1, SEQ ID NO:2).

46. The method according to claim 45 wherein said reactive group is a haloalkyl group which is optionally substituted with a monoether or diether group.

47. The method according to claim 46 wherein said haloalkane is a C₂-C₁₂ haloalkyl group optionally substituted with a monoether or diether group.

48. The method according to claim 46 wherein said reactive group is

49. The method according to any of claims 40-42 wherein said self-labeling tag is a O⁶-alkylguanine-DNA alkyltransferase that reacts specifically with benzylguanine (BG) derivatives (SEQ ID NO:3, SEQ ID NO:4, SEQ ID NO:5, SEQ ID NO:6).

50. The method according to claim 49 wherein said reactive group is

51. The method according to any of claims 40-42 wherein said self-labeling tag is a O⁶-alkylguanine-DNA alkyltransferase that reacts specifically with benzylcytosine (BC) derivatives (SEQ ID NO:7).

52. The method according to claim 51 wherein said reactive group is

53. The method according to any of claims 40-42 wherein said self-labeling tag is a phosphopantetheinyl transferase AcpS (SCP synthase) that reacts specifically with Coenzyme A derivatives (SEQ ID NO:8, SEQ ID NO:9).

54. The method according to any of claims 40-42 wherein said self-labeling tag is a phosphopantetheinyl transferase Sfp (Sfp synthase) that reacts specifically with CoenzymeA derivatives (SEQ ID NO:10).

55. The method according to claim 53 or 54 wherein said reactive group is

56. The method according to any of claims 38-55 wherein said protein of interest is a structural protein, receptor, enzyme, cell surface protein, a protein involved in catalytic activity, aromatase activity, motor activity, helicase activity, metabolic processes, antioxidant activity, proteolysis, biosynthesis, kinase activity, oxidoreductase activity, transferase activity, hydrolase activity, lyase activity, isomerase activity, ligase activity, enzyme regulator activity, signal transducer activity, structural molecule activity, binding activity, cell motility, membrane fusion, cell communication, regulation of biological processes, development, cell differentiation, response to stimulus, behavioral proteins, cell adhesion proteins, proteins involved in cell death, protein transporter activity, nuclear transport, ion transporter activity, channel transporter activity, carrier activity, permease activity, secretion activity, electron transporter activity, pathogenesis, chaperone regulator activity, nucleic acid binding activity, transcription regulator activity, extracellular organization and biogenesis activity or translation regulator activity.

57. The method according to any of claims 38-56 wherein said protein of interest is a eukaryotic protein.

58. The method according to any of claims 38-56 wherein said protein of interest is a prokaryotic protein.

59. The method according to any of claims 38-58 wherein said hydrophobic group has a ClogP of at least about 1.5.

60. The method according to any of claims 38-58 wherein said hydrophobic group is a group from figure 14 hereof.

61. The method according to any of claims 38-58 wherein said hydrophobic group is other than a reporter group.

62. The method according to any of claims 38-58 wherein said hydrophobic group is other than a fluorescent moiety.

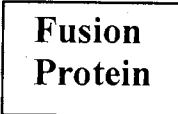

63. The method according to any of claims 40-62 wherein said hydrophobically labeled fusion protein is a compound according to the structure:

Where  is a hydrophobic group;

Z is a group which links  to X;

X is a group linking Z to group Y_{Rp};

 is a fusion protein comprising a protein of interest and a self-labeling polypeptide tag linked to said protein of interest in said fusion protein, said self-labeling

polypeptide tag being reactive with a reactive group Y_R to covalently link said  group to said fusion protein; and

Y_{Rp} is a chemical moiety formed by the action of the fusion protein on said reactive group Y_R which links the fusion protein to said hydrophobic group through said X group and said Z group.

64. The method according to claim 63 wherein said compound is according to the chemical structure:

or

Where HYD , Z, X and $Fusion\ Protein$ are as described in claim 63 and X_{Fp} is a N, O or S group from the fusion protein through which the reactive Y_R covalently binds to the fusion protein.

65. The method according to any of claims 63 or 64 wherein Z is a bond, $-(CH_2)_i-O$,

$-(CH_2)_i-S$, $-(CH_2)_i-N-R$, a $(CH_2)_i-X_1Y_1$ group wherein X_1Y_1 forms an amide group, or a urethane group, ester or thioester group, or a

Each R is H, or a C₁-C₃ alkyl or alkanol group;

Each Y is independently a bond, O, S or N-R;

and each i is independently 0 to 100; and

Where each D is independently a bond (absent),

j is 1 to 100;

k is 1 to 100;

m' is 1 to 100;

n is 1 to 100;

X¹ is O, S or N-R;

Y is the same as above; and

CON is a bond (absent) or a

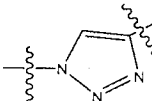

Where X^2 is O, S, NR^4 , $S(O)$, $S(O)_2$, $-S(O)_2O$, $-OS(O)_2$, or $OS(O)_2O$;

X^3 is O, S, NR^4 ; and

R^4 is H or a C_1 - C_3 alkyl group, or

a pharmaceutically acceptable salt, enantiomer or stereoisomer thereof.

66. The method according to claim 65 wherein **CON** is a  group or an amide group.

67. The method according to any of claims 38-66 wherein said degradation of protein is measured using immunoassay, immunoblot, absorbance assay, mass spectrometry or proteomics.

68. A method of inducing degradation of a fusion protein in a cell, said method comprising

1. expressing a fusion protein in a cell wherein said fusion protein comprises a protein of interest and a self-labeling polypeptide tag;
2. reacting intracellularly or on the surface of said cell said expressed fusion protein with a compound comprising a hydrophobic group and a group reactive with said self-labeling polypeptide tag, wherein said compound upon reaction with said self-labeling polypeptide tag forms a covalent bond with said fusion protein to form a hydrophobically labeled fusion protein; and
3. allowing said fusion protein to degrade.

Frizzled-4

Short exposure

Long exposure

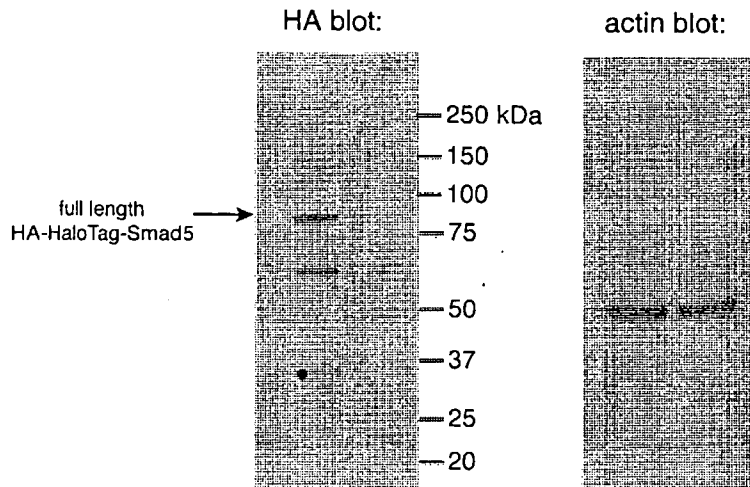

FIGURE 12F

HA-HaloTag-Smad5

Expected MW of HA-HaloTag-Smad5 is 85 kDa. Two smaller bands were consistently observed, presumably due to proteolysis of the full length protein.
