(54) Title: ANTIBODY-DRUG CONJUGATES AND METHODS OF USE

(57) Abstract: The present disclosure provides antibody-drug conjugates that are potent cytotoxins, wherein the drug is linked to the antibody through a linker. The disclosure is also directed to compositions containing the antibody-drug conjugates, and to methods of treatment using them.

WO 2007/038658 A2

ANTIBODY-DRUG CONJUGATES AND METHODS OF USE

CROSS-REFERENCE TO RELATED APPLICATIONS

This application claims the benefit of U.S. Provisional Application Serial No. 5 60/720,499 filed on September 26, 2005, the benefit of the earlier filing date of which is hereby claimed under 35 U.S.C. § 119(e), and the entire content is incorporated herein by reference.

FIELD OF THE INVENTION

10 The present invention provides antibody-drug conjugates that are cleaved *in vivo*. The antibody-drug conjugates can form prodrugs and conjugates of cytotoxins.

BACKGROUND OF THE INVENTION

Many therapeutic agents, particularly those that are especially effective in cancer chemotherapy, often exhibit acute toxicity *in vivo*, especially bone marrow and 15 mucosal toxicity, as well as chronic cardiac and neurological toxicity. Such high toxicity can limit their applications. Development of more and safer specific therapeutic agents, particularly antitumor agents, is desirable for greater effectiveness against tumor cells and a decrease in the number and severity of the side effects of these products (toxicity, destruction of non-tumor cells, etc.). Another difficulty with some existing therapeutic agents is their 20 less than optimal stability in plasma. Addition of functional groups to stabilize these compounds resulted in a significant lowering of the activity. Accordingly, it is desirable to identify ways to stabilize compounds while maintaining acceptable therapeutic activity levels.

25 The search for more selective cytotoxic agents has been extremely active for many decades, the dose limiting toxicity (i.e. the undesirable activity of the cytotoxins on normal tissues) being one of the major causes of failures in cancer therapy. For example, CC-1065 and the duocarmycins are known to be extremely potent cytotoxins.

CC-1065 was first isolated from *Streptomyces zelensis* in 1981 by the Upjohn Company (Hanka *et al.*, *J. Antibiot.* **31**: 1211 (1978); Martin *et al.*, *J. Antibiot.* **33**: 902 30 (1980); Martin *et al.*, *J. Antibiot.* **34**: 1119 (1981)) and was found to have potent antitumor and antimicrobial activity both *in vitro* and in experimental animals (Li *et al.*, *Cancer Res.*

42: 999 (1982)). CC-1065 binds to double-stranded B-DNA within the minor groove (Swenson *et al.*, *Cancer Res.* **42**: 2821 (1982)) with the sequence preference of 5'-d(A/GNTTA)-3' and 5'-d(AAAAA)-3' and alkylates the N3 position of the 3'-adenine by its CPI left-hand unit present in the molecule (Hurley *et al.*, *Science* **226**: 843 (1984)). Despite its potent and broad antitumor activity, CC-1065 cannot be used in humans because it causes delayed death in experimental animals.

Many analogues and derivatives of CC-1065 and the duocarmycins are known in the art. The research into the structure, synthesis and properties of many of the compounds has been reviewed. See, for example, Boger *et al.*, *Angew. Chem. Int. Ed. Engl.* **35**: 1438 (1996); and Boger *et al.*, *Chem. Rev.* **97**: 787 (1997).

A group at Kyowa Hakko Kogyo Co., Ltd. has prepared a number of CC-1065 derivatives. See, for example, U.S. Pat. No. 5,101,038; 5,641,780; 5,187,186; 5,070,092; 5,703,080; 5,070,092; 5,641,780; 5,101,038; and 5,084,468; and published PCT application, WO 96/10405 and published European application 0 537 575 A1.

The Upjohn Company (Pharmacia Upjohn) has also been active in preparing derivatives of CC-1065. See, for example, U.S. Patent No. 5,739,350; 4,978,757, 5,332,837 and 4,912,227.

Research has also focused on the development of new therapeutic agents which are in the form of prodrugs, compounds that are capable of being converted to drugs (active therapeutic compounds) *in vivo* by certain chemical or enzymatic modifications of their structure. For purposes of reducing toxicity, this conversion is preferably confined to the site of action or target tissue rather than the circulatory system or non-target tissue. However, even prodrugs are problematic as many are characterized by a low stability in blood and serum, due to the presence of enzymes that degrade or activate the prodrugs before the prodrugs reach the desired sites within the patient's body.

Bristol-Myers Squibb has described particular lysosomal enzyme-cleavable antitumor drug conjugates. See, for example, U.S. Patent No. 6,214,345. This patent provides an aminobenzyl oxycarbonyl.

Seattle Genetics has published applications U.S. Pat. Appl. 2003/0096743 and U.S. Pat. Appl. 2003/0130189, which describe p-aminobenzylethers in drug delivery agents. The linkers described in these applications are limited to aminobenzyl ether compositions.

Other groups have also described linkers. See for example de Groot *et al.*, *J. Med. Chem.* 42, 5277 (1999); de Groot *et al.* *J. Org. Chem.* 43, 3093 (2000); de Groot *et al.*, *J. Med. Chem.* 66, 8815, (2001); WO 02/083180; Carl *et al.*, *J. Med. Chem. Lett.* 24, 479, (1981); Dubowchik *et al.*, *Bioorg & Med. Chem. Lett.* 8, 3347 (1998). These linkers include
5 aminobenzyl ether spacer, elongated electronic cascade and cyclization spacer systems, cyclisation eliminations spacers, such as w-amino aminocarbonyls, and a *p* aminobenzyl oxycarbonyl linker.

Stability of cytotoxin drugs, including *in vivo* stability, is still an important issue that needs to be addressed. In addition, the toxicity of many compounds makes them
10 less useful, so compositions that will reduce drug toxicity, such as the formation of a cleaveable prodrug, are needed. Therefore, in spite of the advances in the art, there continues to be a need for the development of improved therapeutic agents for the treatment of mammals, and humans in particular, more specifically cytotoxins that exhibit high specificity of action, reduced toxicity, and improved stability in blood relative to known compounds of
15 similar structure. The instant invention addresses those needs.

SUMMARY OF THE INVENTION

The present invention relates to antibody-drug conjugates where the drug and antibody are linked through a linker, such as a peptidyl, hydrazine, or disulfide linker. These
20 conjugates are potent cytotoxins that can be selectively delivered to a site of action of interest in an active form and then cleaved to release the active drug. The linker arms of the invention can be cleaved from the cytotoxic drugs by, for example, enzymatic or reductive means *in vivo*, releasing an active drug moiety from the prodrug derivative.

One embodiment is an antibody-drug conjugate that includes an antibody
25 having specificity for at least one type of tumor; a drug; and a linker coupling the drug to the antibody. The linker is cleavable in the presence of the tumor. The antibody-drug conjugate retards or arrests growth of the tumor when administered in an amount corresponding to a daily dosage of 1 μ mole/kg or less. Preferably, the antibody-drug conjugate retards growth of the tumor when administered in an amount corresponding to a daily dosage of 1 μ mole/kg
30 or less (referring to moles of the drug) over a period of at least five days. In at least some

embodiments, the tumor is a human-type tumor in a SCID mouse. As an example, the SCID mouse can be a CB17.SCID mouse (available from Taconic, Germantown, NY).

The invention also relates to groups useful for stabilizing therapeutic agents and markers. The stabilizing groups are selected, for example, to limit clearance and metabolism of the therapeutic agent or marker by enzymes that may be present in blood or non-target tissue. The stabilizing groups can serve to block degradation of the agent or marker and may also act in providing other physical characteristics of the agent or marker, for example to increase the solubility of the compound or to decrease the aggregation properties of the compound. The stabilizing group may also improve the agent or marker's stability during storage in either a formulated or non-formulated form.

In another aspect, the invention provides a cytotoxic drug-ligand compound having a structure according to any of Formulas 1-3:

15

wherein the symbol D is a drug moiety having pendant to the backbone thereof a chemically reactive functional group, said functional group selected from the group consisting of a primary or secondary amine, hydroxyl, sulfhydryl, carboxyl, aldehyde, and a ketone.

20

The symbol L^1 represents a self-immolative spacer where m is an integer of 0, 1, 2, 3, 4, 5, or 6.

25

The symbol X^4 represents a member selected from the group consisting of protected reactive functional groups, unprotected reactive functional groups, detectable labels, and targeting agents.

The symbol L^4 represents a linker member, and p is 0 or 1. L^4 is a moiety that imparts increased solubility or decreased aggregation properties to the conjugates. Examples

of L⁴ moieties include substituted alkyl, unsubstituted alkyl, substituted aryl, unsubstituted aryl, substituted heteroalkyl, or unsubstituted heteroalkyl, any of which may be straight, branched, or cyclic, a positively or negatively charged amino acid polymer, such as polylysine or polyarginine, or other polymers such as polyethylene glycol.

5 The symbols F, H, and J represent linkers, as described further herein.

In one embodiment, the invention pertains to peptide linker conjugate of the structure:

10

wherein

D is a drug moiety having pendant to the backbone thereof a chemically reactive functional group, said functional group selected from the group consisting of a primary or secondary amine, hydroxyl, thiol, carboxyl, aldehyde, and a
15 ketone;

L¹ is a self-immolative linker;

m is an integer 0, 1, 2, 3, 4, 5, or 6;

F is a linker comprising the structure:

20

wherein

AA¹ is one or more members independently selected from the group consisting of natural amino acids and unnatural α-amino acids;

25

c is an integer from 1 to 20;

L² is a self-immolative linker;

L^3 is a spacer group comprising a primary or secondary amine or a carboxyl functional group; wherein if L^3 is present, m is 0 and either the amine of L^3 forms an amide bond with a pendant carboxyl functional group of D or the carboxyl of L^3 forms an amide bond with a pendant amine functional group of D ;

5 o is 0 or 1;

L^4 is a linker member, wherein L^4 does not comprise a carboxylic acyl group directly attached to the N-terminus of $(AA^1)_c$;

p is 0 or 1; and

10 X^4 is a member selected from the group consisting of protected reactive functional groups, unprotected reactive functional groups, detectable labels, and targeting agents.

In one embodiment, the peptide linker conjugate comprises the following structure:

15 In another embodiment, the peptide linker conjugate comprises the following structure:

20 In a preferred embodiment, L^3 comprises an aromatic group. For example, L^3 can comprise a benzoic acid group, an aniline group, or an indole group. Non-limiting examples of $-L^3-NH-$ include structures selected from the following group:

wherein Z is a member selected from O, S and NR^{23} , and

wherein R^{23} is a member selected from H, substituted or unsubstituted alkyl,

5 substituted or unsubstituted heteroalkyl, and acyl.

In preferred embodiments of the peptide linker, $(\text{AA}^1)_c$ is a peptide sequence cleavable by a protease expressed in tumor tissue. A preferred protease is a lysosomal protease. In preferred embodiments, c is an integer from 2 to 6, or c is 2, 3 or 4. In certain

10 embodiments, the amino acid in $(\text{AA}^1)_c$ located closest to the drug moiety is selected from the group consisting of: Ala, Asn, Asp, Cit, Cys, Gln, Glu, Gly, Ile, Leu, Lys, Met, Phe, Pro, Ser, Thr, Trp, Tyr, and Val. In preferred embodiments, $(\text{AA}^1)_c$ is a peptide sequence selected from the group consisting of Val-Cit, Val-Lys, Phe-Lys, Lys-Lys, Ala-Lys, Phe-Cit, Leu-Cit, Ile-Cit, Trp, Cit, Phe-Ala, Phe- N^9 -tosyl-Arg, Phe- N^9 -nitro-Arg, Phe-Phe-Lys, D-Phe-Phe-Lys, Gly-Phe-Lys, Leu-Ala-Leu, Ile-Ala-Leu, Val-Ala-Val, Ala-Leu-Ala-Leu (SEQ ID NO:

15 1), β -Ala-Leu-Ala-Leu (SEQ ID NO: 2) and Gly-Phe-Leu-Gly (SEQ ID NO: 3). In particularly preferred embodiments, $(\text{AA}^1)_c$ is Val-Cit or Val-Lys.

In some preferred embodiments, the peptide linker, F, comprises the structure:

wherein

5 R^{24} is selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted heteroalkyl;

Each K is a member independently selected from the group consisting of substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl, unsubstituted heterocycloalkyl, halogen, NO_2 , $\text{NR}^{21}\text{R}^{22}$, $\text{NR}^{21}\text{COR}^{22}$, $\text{OCONR}^{21}\text{R}^{22}$, OCOR^{21} , and OR^{21}

wherein

15 R^{21} and R^{22} are independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl, unsubstituted heterocycloalkyl; and

a is an integer of 0, 1, 2, 3, or 4.

In other preferred embodiments, $-(L^1)_m-$ comprises the structure:

20

wherein

each R^{24} is a member independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted heteroalkyl.

In another aspect, the invention pertains to hydrazine linker conjugates of the structure:

wherein

D is a drug moiety having pendant to the backbone thereof a chemically reactive functional group, said function group selected from the group consisting of a primary or secondary amine, hydroxyl, thiol, carboxyl, aldehyde, and a ketone;

L^1 is a self-immolative linker;

m is an integer selected from 0, 1, 2, 3, 4, 5, or 6;

X^4 is a member selected from the group consisting of protected reactive functional groups, unprotected reactive functional groups, detectable labels, and targeting agents;

L^4 is a linker member;

p is 0 or 1;

H is a linker comprising the structure:

wherein

n_1 is an integer from 1 – 10;

n_2 is 0, 1, or 2;

each R^{24} is a member independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted heteroalkyl; and

I is either a bond or:

wherein n_3 is 0 or 1 with the proviso that when n_3 is 0, n_2 is not 0; and

5 n_4 is 1, 2, or 3,

wherein when I is a bond, n_1 is 3 and n_2 is 1, D can not be

where R is Me or $\text{CH}_2\text{-CH}_2\text{-NMe}_2$.

10 In some preferred embodiments, the substitution on the phenyl ring is a para substitution. In some preferred embodiments, n_1 is 2, 3, or 4 or n_1 is 3 or n_2 is 1.

In certain embodiments, I is a bond. In other embodiments, n_3 is 0 and n_4 is 2.

15 In various aspects, the invention provides hydrazine linkers, H, that can form a 6-membered self immolative linker upon cleavage, or two 5-membered self immolative linkers upon cleavage, or a single 5-membered self immolative linker upon cleavage, or a single 7-membered self immolative linker upon cleavage, or a 5-membered self immolative linker and a 6-membered self immolative linker upon cleavage.

In a preferred embodiment, H comprises a geminal dimethyl substitution.

In a preferred embodiment, H comprises the structure:

20

Preferably, n_1 is 2, 3, or 4, more preferably n_1 is 3. Preferably, each R_{24} is independently selected from CH_3 and H. In certain preferred embodiments, each R_{24} is H.

In another preferred embodiment, H comprises the structure:

5

Preferably, n_1 is 3. Preferably, each R_{24} is independently selected from CH_3 and H.

In yet other preferred embodiments, H comprises the structure:

10

Preferably, each R_{24} independently an H or a substituted or unsubstituted alkyl.

15 In another aspect, the invention pertains to hydrazine linker conjugates of the structure:

wherein

20 D is a drug moiety having pendant to the backbone thereof a chemically reactive functional group, said function group selected from the group consisting of a primary or secondary amine, hydroxyl, thiol, carboxyl, aldehyde, and a ketone;

L^1 is a self-immolative linker;

m is an integer selected from 0, 1, 2, 3, 4, 5, or 6;

X^4 is a member selected from the group consisting of protected reactive functional groups, unprotected reactive functional groups, detectable labels, and targeting agents;

L^4 is a linker member;

p is 0 or 1; and

H comprises the structure:

where q is 0, 1, 2, 3, 4, 5, or 6; and

each R^{24} is a member independently selected from the group consisting

of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted heteroalkyl.

In yet another aspect, the invention pertains to disulfide linker conjugates of the structure:

wherein

D is a drug moiety having pendant to the backbone thereof a chemically reactive functional group, said function group selected from the group consisting of a primary or secondary amine, hydroxyl, thiol, carboxyl, aldehyde, and a ketone;

L^1 is a self-immolative linker;

m is an integer selected from 0, 1, 2, 3, 4, 5, or 6;

X^4 is a member selected from the group consisting of protected reactive functional groups, unprotected reactive functional groups, detectable labels, and targeting agents;

L^4 is a linker member;

P is 0 or 1;

J is a linker comprising the structure:

5 wherein

each R^{24} is a member independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted heteroalkyl;

10 each K is a member independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl, unsubstituted heterocycloalkyl, halogen, NO_2 , $\text{NR}^{21}\text{R}^{22}$, $\text{NR}^{21}\text{COR}^{22}$, $\text{OCONR}^{21}\text{R}^{22}$, OCOR^{21} , and OR^{21}

wherein

15 R^{21} and R^{22} are independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl and unsubstituted heterocycloalkyl;

a is an integer of 0, 1, 2, 3, or 4; and

20 d is an integer of 0, 1, 2, 3, 4, 5, or 6.

In various embodiments, J can comprise one of the following structures:

wherein d is 1 or 2;

or

5

In all of the foregoing linker conjugates, D preferably is a cytotoxic drug. In preferred embodiments, D has a chemically reactive function group selected from the group consisting of a primary or secondary amine, hydroxyl, sulfhydryl and carboxyl. Non-limiting examples of preferred drugs, D, include duocarmycins and duocarmycin analogs and derivatives, CC-1065, CBI-based duocarmycin analogues, MCBI-based duocarmycin analogues, CCBI-based duocarmycin analogues, doxorubicin, doxorubicin conjugates, morpholino-doxorubicin, cyanomorpholino-doxorubicin, dolastatins, dolestatin-10, combretastatin, calicheamicin, maytansine, maytansine analogues, DM-1, auristatin E, auristatin EB (AEB), auristatin EFP (AEFP), monomethyl auristatin E (MMAE), 5-benzoylvaleric acid-AE ester (AEVB), tubulysins, disorazole, epothilones, Paclitaxel, docetaxel, SN-38, Topotecan, rhizoxin, echinomycin, colchicine, vinblastin, vindesine,

15

estramustine, cemadotin, eleutherobin, methotrexate, methopterin, dichloromethotrexate, 5-fluorouracil, 6-mercaptapurine, cytosine arabinoside, melphalan, leurosine, leurosideine, actinomycin, daunorubicin, daunorubicin conjugates, mitomycin C, mitomycin A, carminomycin, aminopterin, tallysomycin, podophyllotoxin, podophyllotoxin derivatives, etoposide, etoposide phosphate, vincristine, taxol, taxotere retinoic acid, butyric acid, N⁸-acetyl spermidine and camptothecin.

In a preferred embodiment, D is a duocarmycin analog or derivative that comprises a structure:

10 wherein the ring system A is a member selected from substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl and substituted or unsubstituted heterocycloalkyl groups;

E and G are members independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, a heteroatom, a single bond, or
 15 E and G are joined to form a ring system selected from substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl and substituted or unsubstituted heterocycloalkyl;

X is a member selected from O, S and NR²³;

R²³ is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl;

20 R³ is a member selected from the group consisting of (=O), SR¹¹, NHR¹¹ and OR¹¹,

wherein

R¹¹ is a member selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, diphosphates,

triphosphates, acyl, $C(O)R^{12}R^{13}$, $C(O)OR^{12}$, $C(O)NR^{12}R^{13}$, $P(O)(OR^{12})_2$, $C(O)CHR^{12}R^{13}$, SR^{12} and $SiR^{12}R^{13}R^{14}$,

in which

R^{12} , R^{13} , and R^{14} are members independently selected from H,

5 substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl and substituted or unsubstituted aryl, wherein R^{12} and R^{13} together with the nitrogen or carbon atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more heteroatoms;

R^4 , $R^{4'}$, R^5 and $R^{5'}$ are members independently selected from the

10 group consisting of H, substituted alkyl, unsubstituted alkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl, unsubstituted heterocycloalkyl, halogen, NO_2 , $NR^{15}R^{16}$, $NC(O)R^{15}$, $OC(O)NR^{15}R^{16}$, $OC(O)OR^{15}$, $C(O)R^{15}$, SR^{15} , OR^{15} , $CR^{15}=NR^{16}$, and $O(CH_2)_nN(CH_3)_2$

wherein

15 n is an integer from 1 to 20;

R^{15} and R^{16} are independently selected from H, substituted or

unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, substituted or unsubstituted heterocycloalkyl, and substituted or unsubstituted peptidyl, wherein R^{15} and R^{16} together with the nitrogen atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more heteroatoms;

R^6 is a single bond which is either present or absent and when present R^6 and R^7 are joined to form a cyclopropyl ring; and

25 R^7 is CH_2-X^1 or $-CH_2-$ joined in said cyclopropyl ring with R^6 ,

wherein

X^1 is a leaving group,

wherein at least one of R^{11} , R^{12} , R^{13} , R^{15} or R^{16} links said drug to L^1 , if present, or to F, H, or J.

30

In a preferred embodiment, D has the structure:

wherein

Z is a member selected from O, S and NR²³

wherein

5 R²³ is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl;

R¹ is H, substituted or unsubstituted lower alkyl, C(O)R⁸, or CO₂R⁸, wherein R⁸ is a member selected from group consisting of substituted alkyl, unsubstituted alkyl, NR⁹R¹⁰, NR⁹NHR¹⁰, and OR⁹

10 in which

R⁹ and R¹⁰ are members independently selected from H, substituted or unsubstituted alkyl and substituted or unsubstituted heteroalkyl; and

R² is H, substituted alkyl or unsubstituted lower alkyl;

15 wherein at least one of R¹¹, R¹², R¹³, R¹⁵ or R¹⁶ links said drug to L¹, if present, or to F, H, or J.

In a preferred embodiment of the above, R² is an unsubstituted lower alkyl.

In another preferred embodiment, D has the structure:

wherein

Z is a member selected from O, S and NR²³

wherein

R²³ is a member selected from H, substituted or unsubstituted alkyl,
5 substituted or unsubstituted heteroalkyl, and acyl;

R¹ is H, substituted or unsubstituted lower alkyl, C(O)R⁸, or CO₂R⁸,
wherein R⁸ is a member selected from NR⁹R¹⁰ and OR⁹,

in which

R⁹ and R¹⁰ are members independently selected from H, substituted or
10 unsubstituted alkyl and substituted or unsubstituted heteroalkyl;

R^{1'} is H, substituted or unsubstituted lower alkyl, or C(O)R⁸, wherein
R⁸ is a member selected from NR⁹R¹⁰ and OR⁹,

in which

R⁹ and R¹⁰ are members independently selected from H, substituted or
15 unsubstituted alkyl and substituted or unsubstituted heteroalkyl;

R² is H, or substituted or unsubstituted lower alkyl or unsubstituted
heteroalkyl or cyano or alkoxy; and

R^{2'} is H, or substituted or unsubstituted lower alkyl or unsubstituted
heteroalkyl,

20 wherein at least one of R¹¹, R¹², R¹³, R¹⁵ or R¹⁶ links said drug to L¹, if
present, or to F, H, or J.

In all of the foregoing linker conjugate structures, L⁴ preferably comprises a
non-cyclic moiety. L⁴ preferably increases solubility of the compound as compared to the
25 compound lacking L⁴ and/or L⁴ decreases aggregation of the compound as compared to the
compound lacking L⁴. In a preferred embodiment, L⁴ comprises a polyethylene glycol
moiety. The polyethylene glycol moiety can contain, for example, 3-12 repeat units, or 2-6
repeat units or, more preferably, 4 repeat units.

In yet another aspect, the invention provides a cytotoxic drug-ligand
30 compound having a structure according to the following formula:

wherein the symbol L^1 represents a self-immolative spacer where m is an integer of 0, 1, 2, 3, 4, 5, or 6.

The symbol X^4 represents a member selected from the group consisting of protected reactive functional groups, unprotected reactive functional groups, detectable labels, and targeting agents.

The symbol L^4 represents a linker member, and p is 0 or 1. L^4 is a moiety that imparts increased solubility or decreased aggregation properties to the conjugates. Examples of L^4 moieties include substituted alkyl, unsubstituted alkyl, substituted aryl, unsubstituted aryl, substituted heteroalkyl, or unsubstituted heteroalkyl, any of which may be straight, branched, or cyclic, a positively or negatively charged amino acid polymer, such as polylysine or polyarginine, or other polymers such as polyethylene glycol.

The symbol Q represent any cleavable linker including, but not limited to, any of the peptidyl, hydrozone, and disulfide linkers described herein. Cleavable linkers include those that can be selectively cleaved by a chemical or biological process and upon cleavage separate the drug, D^1 , from X^4 .

The symbol D^1 represents a drug having the following formula:

wherein X and Z are members independently selected from O, S and

20 NR^{23} ;

R^{23} is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl;

R^1 is H, substituted or unsubstituted lower alkyl, $C(O)R^8$, or CO_2R^8 ,

$R^{1'}$ is H, substituted or unsubstituted lower alkyl, or $C(O)R^8$,

wherein R^8 is a member selected from NR^9R^{10} and OR^9 and R^9 and R^{10} are members independently selected from H, substituted or unsubstituted alkyl and substituted or unsubstituted heteroalkyl;

R^2 is H, or substituted or unsubstituted lower alkyl or unsubstituted heteroalkyl or cyano or alkoxy;

$R^{2'}$ is H, or substituted or unsubstituted lower alkyl or unsubstituted heteroalkyl,

R^3 is a member selected from the group consisting of SR^{11} , NHR^{11} and OR^{11} , wherein R^{11} is a member selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, diphosphates, triphosphates, acyl, $C(O)R^{12}R^{13}$, $C(O)OR^{12}$, $C(O)NR^{12}R^{13}$, $P(O)(OR^{12})_2$, $C(O)CHR^{12}R^{13}$, SR^{12} and $SiR^{12}R^{13}R^{14}$, in which R^{12} , R^{13} , and R^{14} are members independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl and substituted or unsubstituted aryl, wherein R^{12} and R^{13} together with the nitrogen or carbon atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more heteroatoms;

wherein at least one of R^{11} , R^{12} , and R^{13} links said drug to L^1 , if present, or to Q,

R^6 is a single bond which is either present or absent and when present R^6 and R^7 are joined to form a cyclopropyl ring; and

R^7 is CH_2-X^1 or $-CH_2-$ joined in said cyclopropyl ring with R^6 ,

wherein

X^1 is a leaving group,

R^4 , $R^{4'}$, R^5 and $R^{5'}$ are members independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl, unsubstituted heterocycloalkyl, halogen, NO_2 , $NR^{15}R^{16}$, $NC(O)R^{15}$, $OC(O)NR^{15}R^{16}$, $OC(O)OR^{15}$, $C(O)R^{15}$, SR^{15} , OR^{15} , $CR^{15}=NR^{16}$, and $O(CH_2)_nNR^{24}R^{25}$ wherein n is an integer from 1 to 20;

R^{15} and R^{16} are independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl,

substituted or unsubstituted heteroaryl, substituted or unsubstituted heterocycloalkyl, and substituted or unsubstituted peptidyl, wherein R¹⁵ and R¹⁶ together with the nitrogen atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more heteroatoms;

and R²⁴ and R²⁵ are independently selected from unsubstituted alkyl,

and

wherein at least one of R⁴, R^{4'}, R⁵ and R^{5'} is O(CH₂)_nNR²⁴R²⁵.

In yet another aspect, the invention pertains to pharmaceutical formulations.

Such formulations typically comprise a conjugate compound of the invention and a pharmaceutically acceptable carrier.

In still a further aspect, the invention pertains to methods of using the conjugate compounds of the invention. For example, the invention provides a method of killing a cell, wherein a conjugate compound of the invention is administered to the cell an amount sufficient to kill the cell. In a preferred embodiment, the cell is a tumor cell. In another embodiment, the invention provides a method of retarding or stopping the growth of a tumor in a mammalian subject, wherein a conjugate compound of the invention is administered to the subject an amount sufficient to retard or stop growth of the tumor.

Other aspects, advantages and objects of the invention will be apparent from review of the detailed description below.

BRIEF DESCRIPTION OF THE DRAWINGS

Non-limiting and non-exhaustive embodiments of the present invention are described with reference to the following drawings. For a better understanding of the present invention, reference will be made to the following Detailed Description, which is to be read in association with the accompanying drawings, wherein:

FIG. 1 is a graph of changes in tumor volume over time for mice dosed with an isotype control antibody-drug conjugate, a α PSMA antibody-drug conjugate, or a conjugation buffer alone (vehicle);

FIG. 2 is a graph of changes in tumor volume over time for mice dosed with various amounts of a α PSMA antibody-drug conjugate or a conjugation buffer alone (vehicle);

FIG. 3 is a graph of changes in tumor volume over time for mice dosed with various amounts of an isotype control antibody-drug conjugate or a conjugation buffer alone (vehicle);

FIG. 4 is a graph of body weight change over time for mice dosed with various amounts of an isotype control antibody-drug conjugate or a conjugation buffer alone (vehicle);

FIG. 5 is a graph of body weight change over time for mice dosed with various amounts of a α PSMA antibody-drug conjugate or a conjugation buffer alone (vehicle);

FIG. 6 is a graph of changes in tumor volume over time, for tumors having an initial average tumor volume of 240 mm^3 , for mice dosed with an isotype control antibody-drug conjugate, a α PSMA antibody-drug conjugate, or a conjugation buffer alone (vehicle);

FIG. 7 is a graph of changes in tumor volume over time, for tumors having an initial average tumor volume of 430 mm^3 , for mice dosed with a α PSMA antibody-drug conjugate or a conjugation buffer alone (vehicle);

FIG. 8 is a graph comparing changes in tumor volume over time for mice dosed with an isotype control and toxin-antibody conjugates; and

FIG. 9 is a graph comparing changes in body weight over time for mice dosed with an isotype control and toxin-antibody conjugates.

DETAILED DESCRIPTION OF THE INVENTION

Abbreviations

- As used herein, "Ala," refers to alanine.
- "Boc," refers to *t*-butyloxycarbonyl.
- "CPI," refers to cyclopropapyrroloindole.
- "Cbz," is carbobenzoxy.
- As used herein, "DCM," refers to dichloromethane.
- "DDQ," refers to 2,3-dichloro-5,6-dicyano-1,4-benzoquinone.

DIPEA is diisopropylethalamine

“DMDA” is N,N'-dimethylethylene diamine

“RBF” is a round bottom flask

“DMF” is N,B-dimethylformamide

5 “HATU” is N-[[[(dimethylamino)-1H-1,2,3-triazolo[4,5-b]pyridin-1-yl]methylene]-N-methylmethanaminium hexafluorophosphate N-oxide

As used herein, the symbol “E,” represents an enzymatically cleaveable group.

“EDCI” is 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide.

10 As used herein, “Fmoc,” refers to 9-fluorenylmethyloxycarbonyl.

“Fmoc” refers to 9-fluorenylmethoxycarbonyl.

“HOAt” is 7-Aza-1-hydroxybenzotriazole.

“Leu” is leucine.

“PABA” refers to *para*-aminobenzoic acid.

15 PEG refers to polyethylene glycol

“PMB,” refers to *para*-methoxybenzyl.

“TBAF,” refers to tetrabutylammonium fluoride.

The abbreviation “TBSO,” refers to *t*-butyldimethylsilyl ether.

As used herein, “TEA,” refers to triethylamine.

20 “TFA,” refers to trifluoroacetic acid.

The symbol “Q” refers to a therapeutic agent, diagnostic agent or detectable label.

Definitions

25 Unless defined otherwise, all technical and scientific terms used herein generally have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. Generally, the nomenclature used herein and the laboratory procedures in cell culture, molecular genetics, organic chemistry and nucleic acid chemistry and hybridization described below are those well known and commonly employed in the art.

30 Standard techniques are used for nucleic acid and peptide synthesis. Generally, enzymatic reactions and purification steps are performed according to the manufacturer's specifications.

The techniques and procedures are generally performed according to conventional methods in the art and various general references (*see generally*, Sambrook *et al.* MOLECULAR CLONING: A LABORATORY MANUAL, 2d ed. (1989) Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N.Y., which is incorporated herein by reference), which are provided
5 throughout this document. The nomenclature used herein and the laboratory procedures in analytical chemistry, and organic synthetic described below are those well known and commonly employed in the art. Standard techniques, or modifications thereof, are used for chemical syntheses and chemical analyses.

The term "therapeutic agent" is intended to mean a compound that, when present in a
10 therapeutically effective amount, produces a desired therapeutic effect on a mammal. For treating carcinomas, it is desirable that the therapeutic agent also be capable of entering the target cell.

The term "cytotoxin" is intended to mean a therapeutic agent having the desired effect of being cytotoxic to cancer cells. Cytotoxic means that the agent arrests the
15 growth of, or kills the cells. Exemplary cytotoxins include, by way of example and not limitation, combretastatins, duocarmycins, the CC-1065 anti-tumor antibiotics, anthracyclines, and related compounds. Other cytotoxins include mycotoxins, ricin and its analogues, calicheamycins, doxorubicin and maytansinoids.

The term "prodrug" and the term "drug conjugate" are used herein
20 interchangeably. Both refer to a compound that is relatively innocuous to cells while still in the conjugated form but which is selectively degraded to a pharmacologically active form by conditions, e.g., enzymes, located within or in the proximity of target cells.

The term "marker" is intended to mean a compound useful in the characterization of tumors or other medical condition, for example, diagnosis, progression of
25 a tumor, and assay of the factors secreted by tumor cells. Markers are considered a subset of "diagnostic agents."

The term "selective" as used in connection with enzymatic cleavage means that the rate of rate of cleavage of the linker moiety is greater than the rate of cleavage of a
peptide having a random sequence of amino acids.

The terms "targeting group" and "targeting agent" are intended to mean a
30 moiety that is (1) able to direct the entity to which it is attached (e.g., therapeutic agent or

marker) to a target cell, for example to a specific type of tumor cell or (2) is preferentially activated at a target tissue, for example a tumor. The targeting group or targeting agent can be a small molecule, which is intended to include both non-peptides and peptides. The targeting group can also be a macromolecule, which includes saccharides, lectins, receptors, 5 ligand for receptors, proteins such as BSA, antibodies, and so forth. In a preferred embodiment of the current invention, the targeting group is an antibody or an antibody fragment, more preferably a monoclonal antibody or monoclonal antibody fragment

The term "self-immolative spacer" refers to a bifunctional chemical moiety that is capable of covalently linking two chemical moieties into a normally stable tripartate 10 molecule. The self-immolative spacer is capable of spontaneously separating from the second moiety if the bond to the first moiety is cleaved.

The term "detectable label" is intended to mean a moiety having a detectable physical or chemical property.

The term "cleaveable group" is intended to mean a moiety that is unstable *in vivo*. Preferably the "cleaveable group" allows for activation of the marker or therapeutic 15 agent by cleaving the marker or agent from the rest of the conjugate. Operatively defined, the linker is preferably cleaved *in vivo* by the biological environment. The cleavage may come from any process without limitation, e.g., enzymatic, reductive, pH, etc. Preferably, the cleaveable group is selected so that activation occurs at the desired site of action, which 20 can be a site in or near the target cells (e.g., carcinoma cells) or tissues such as at the site of therapeutic action or marker activity. Such cleavage may be enzymatic and exemplary enzymatically cleaveable groups include natural amino acids or peptide sequences that end with a natural amino acid, and are attached at their carboxyl terminus to the linker. While the degree of cleavage rate enhancement is not critical to the invention, preferred examples of 25 cleaveable linkers are those in which at least about 10% of the cleaveable groups are cleaved in the blood stream within 24 hours of administration, most preferably at least about 35%.

The term "ligand" means any molecule that specifically binds or reactively associates or complexes with a receptor, substrate, antigenic determinant, or other binding 30 site on a target cell or tissue. Examples of ligands include antibodies and fragments thereof (e.g., a monoclonal antibody or fragment thereof), enzymes (e.g., fibrinolytic enzymes),

biologic response modifiers (e.g., interleukins, interferons, erythropoitin, or colony stimulating factors), peptide hormones, and antigen-binding fragments thereof.

The terms “hydrazine linker” and “self-cyclizing hydrazine linker” are used interchangeably herein. These terms refer to a linker moiety that, upon a change in
5 condition, such as a shift in pH, will undergo a cyclization reaction and form one or more rings. The hydrazine moiety is converted to a hydrazone when attached. This attachment can occur, for example, through a reaction with a ketone group on the L⁴ moiety. Therefore, the term hydrazone linker can also be used to describe the linker of the current invention because of this conversion to a hydrazone upon attachment.

10 The term “five-membered hydrazine linker” or “5-membered hydrazine linker” refers to hydrazine-containing molecular moieties that, upon a change in condition, such as a shift in pH, will undergo a cyclization reaction and form one or more 5-membered rings. Alternatively, this five membered linker may similarly be described as a five-membered hydrazone linker or a 5-membered hydrazone linker.

15 The term “six-membered hydrazine linker” or “6-membered hydrazine linker” refers to hydrazine-containing molecular moieties that, upon a change in condition such as a shift in pH, will undergo a cyclization reaction and form one or more 6-membered rings. This six membered linker may similarly be described as a six-membered hydrazone linker or a 6-membered hydrazone linker.

20 The term “cyclization reaction,” when referring to the cyclization of a peptide, hydrazine, or disulfide linker, indicates the cyclization of that linker into a ring and initiates the separation of the drug-ligand complex. This rate can be measured *ex situ*, and is completed when at least 90%, 95%, or 100% of the product is formed.

25 The terms “polypeptide,” “peptide” and “protein” are used interchangeably herein to refer to a polymer of amino acid residues. The terms apply to amino acid polymers in which one or more amino acid residue is an artificial chemical mimetic of a corresponding naturally occurring amino acid, as well as to naturally occurring amino acid polymers and non-naturally occurring amino acid polymer. These terms also encompass the term “antibody.”

30 The term “amino acid” refers to naturally occurring and synthetic amino acids, as well as amino acid analogs and amino acid mimetics that function in a manner similar to

the naturally occurring amino acids. Naturally occurring amino acids are those encoded by the genetic code, as well as those amino acids that are later modified, *e.g.*, hydroxyproline, γ -carboxyglutamate, and O-phosphoserine. Amino acid analogs refers to compounds that have the same basic chemical structure as a naturally occurring amino acid, *i.e.*, an α carbon that is bound to a hydrogen, a carboxyl group, an amino group, and an R group, *e.g.*, homoserine, norleucine, methionine sulfoxide, methionine methyl sulfonium. Such analogs have modified R groups (*e.g.*, norleucine) or modified peptide backbones, but retain the same basic chemical structure as a naturally occurring amino acid. One amino acid that may be used in particular is citrulline, which is a precursor to arginine and is involved in the formation of urea in the liver. Amino acid mimetics refers to chemical compounds that have a structure that is different from the general chemical structure of an amino acid, but functions in a manner similar to a naturally occurring amino acid. The term "unnatural amino acid" is intended to represent the "D" stereochemical form of the twenty naturally occurring amino acids described above. It is further understood that the term unnatural amino acid includes homologues of the natural amino acids, and synthetically modified forms of the natural amino acids. The synthetically modified forms include, but are not limited to, amino acids having alkylene chains shortened or lengthened by up to two carbon atoms, amino acids comprising optionally substituted aryl groups, and amino acids comprised halogenated groups, preferably halogenated alkyl and aryl groups. When attached to a linker or conjugate of the invention, the amino acid is in the form of an "amino acid side chain", where the carboxylic acid group of the amino acid has been replaced with a keto (C(O)) group. Thus, for example, an alanine side chain is $-C(O)-CH(NH_2)-CH_3$, and so forth.

Amino acids and peptides may be protected by blocking groups. A blocking group is an atom or a chemical moiety that protects the N-terminus of an amino acid or a peptide from undesired reactions and can be used during the synthesis of a drug-ligand conjugate. It should remain attached to the N-terminus throughout the synthesis, and may be removed after completion of synthesis of the drug conjugate by chemical or other conditions that selectively achieve its removal. The blocking groups suitable for N-terminus protection are well known in the art of peptide chemistry. Exemplary blocking groups include, but are not limited to, hydrogen, D-amino acid, and carbobenzoxy (Cbz) chloride.

“Nucleic acid” refers to deoxyribonucleotides or ribonucleotides and polymers thereof in either single- or double-stranded form. The term encompasses nucleic acids containing known nucleotide analogs or modified backbone residues or linkages, which are synthetic, naturally occurring, and non-naturally occurring, which have similar binding properties as the reference nucleic acid, and which are metabolized in a manner similar to the reference nucleotides. Examples of such analogs include, without limitation, phosphorothioates, phosphoramidates, methyl phosphonates, chiral-methyl phosphonates, 2-O-methyl ribonucleotides, peptide-nucleic acids (PNAs).

Unless otherwise indicated, a particular nucleic acid sequence also implicitly encompasses conservatively modified variants thereof (*e.g.*, degenerate codon substitutions) and complementary sequences, as well as the sequence explicitly indicated. Specifically, degenerate codon substitutions may be achieved by generating sequences in which the third position of one or more selected (or all) codons is substituted with mixed-base and/or deoxyinosine residues (Batzer *et al.*, *Nucleic Acid Res.* **19**:5081 (1991); Ohtsuka *et al.*, *J. Biol. Chem.* **260**: 2605-2608 (1985); Rossolini *et al.*, *Mol. Cell. Probes* **8**: 91-98 (1994)). The term nucleic acid is used interchangeably with gene, cDNA, mRNA, oligonucleotide, and polynucleotide.

The symbol \sim , whether utilized as a bond or displayed perpendicular to a bond indicates the point at which the displayed moiety is attached to the remainder of the molecule, solid support, etc.

The term “alkyl,” by itself or as part of another substituent, means, unless otherwise stated, a straight or branched chain, or cyclic hydrocarbon radical, or combination thereof, which may be fully saturated, mono- or polyunsaturated and can include di- and multivalent radicals, having the number of carbon atoms designated (*i.e.* C₁-C₁₀ means one to ten carbons). Examples of saturated hydrocarbon radicals include, but are not limited to, groups such as methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl, isobutyl, sec-butyl, cyclohexyl, (cyclohexyl)methyl, cyclopropylmethyl, homologs and isomers of, for example, n-pentyl, n-hexyl, n-heptyl, n-octyl, and the like. An unsaturated alkyl group is one having one or more double bonds or triple bonds. Examples of unsaturated alkyl groups include, but are not limited to, vinyl, 2-propenyl, crotyl, 2-isopentenyl, 2-(butadienyl), 2,4-pentadienyl, 3-(1,4-pentadienyl), ethynyl, 1- and 3-propynyl, 3-butylnyl, and the higher homologs and

isomers. The term "alkyl," unless otherwise noted, is also meant to include those derivatives of alkyl defined in more detail below, such as "heteroalkyl." Alkyl groups, which are limited to hydrocarbon groups are termed "homoalkyl".

The term "alkylene" by itself or as part of another substituent means a
5 divalent radical derived from an alkane, as exemplified, but not limited, by –
CH₂CH₂CH₂CH₂–, and further includes those groups described below as "heteroalkylene."
Typically, an alkyl (or alkylene) group will have from 1 to 24 carbon atoms, with those
groups having 10 or fewer carbon atoms being preferred in the present invention. A "lower
alkyl" or "lower alkylene" is a shorter chain alkyl or alkylene group, generally having eight
10 or fewer carbon atoms.

The term "heteroalkyl," by itself or in combination with another term, means,
unless otherwise stated, a stable straight or branched chain, or cyclic hydrocarbon radical, or
combinations thereof, consisting of the stated number of carbon atoms and at least one
heteroatom selected from the group consisting of O, N, Si and S, and wherein the nitrogen,
15 carbon and sulfur atoms may optionally be oxidized and the nitrogen heteroatom may
optionally be quaternized. The heteroatom(s) O, N and S and Si may be placed at any
interior position of the heteroalkyl group or at the position at which the alkyl group is
attached to the remainder of the molecule. Examples include, but are not limited to, –CH₂–
CH₂–O–CH₃, –CH₂–CH₂–NH–CH₃, –CH₂–CH₂–N(CH₃)–CH₃, –CH₂–S–CH₂–CH₃, –CH₂–CH₂–
20 S(O)–CH₃, –CH₂–CH₂–S(O)₂–CH₃, –CH=CH–O–CH₃, –Si(CH₃)₃, –CH₂–CH=N–OCH₃, and –
CH=CH–N(CH₃)–CH₃. Up to two heteroatoms may be consecutive, such as, for example, –
CH₂–NH–OCH₃ and –CH₂–O–Si(CH₃)₃. Similarly, the term "heteroalkylene" by itself or as
part of another substituent means a divalent radical derived from heteroalkyl, as exemplified,
but not limited by, –CH₂–CH₂–S–CH₂–CH₂– and –CH₂–S–CH₂–CH₂–NH–CH₂–. For
25 heteroalkylene groups, heteroatoms can also occupy either or both of the chain termini (*e.g.*,
alkyleneoxy, alkylenedioxy, alkyleneamino, alkylenediamino, and the like). The terms
"heteroalkyl" and "heteroalkylene" encompass poly(ethylene glycol) and its derivatives (see,
for example, Shearwater Polymers Catalog, 2001). Still further, for alkylene and
heteroalkylene linking groups, no orientation of the linking group is implied by the direction
30 in which the formula of the linking group is written. For example, the formula –C(O)₂R'–
represents both –C(O)₂R'– and –R'C(O)₂–.

The term "lower" in combination with the terms "alkyl" or "heteroalkyl" refers to a moiety having from 1 to 6 carbon atoms.

The terms "alkoxy," "alkylamino," "alkylsulfonyl," and "alkylthio" (or thioalkoxy) are used in their conventional sense, and refer to those alkyl groups attached to the remainder of the molecule via an oxygen atom, an amino group, an SO₂ group or a sulfur atom, respectively. The term "arylsulfonyl" refers to an aryl group attached to the remainder of the molecule via an SO₂ group, and the term "sulfhydryl" refers to an SH group.

In general, an "acyl substituent" is also selected from the group set forth above. As used herein, the term "acyl substituent" refers to groups attached to, and fulfilling the valence of a carbonyl carbon that is either directly or indirectly attached to the polycyclic nucleus of the compounds of the present invention.

The terms "cycloalkyl" and "heterocycloalkyl", by themselves or in combination with other terms, represent, unless otherwise stated, cyclic versions of substituted or unsubstituted "alkyl" and substituted or unsubstituted "heteroalkyl", respectively. Additionally, for heterocycloalkyl, a heteroatom can occupy the position at which the heterocycle is attached to the remainder of the molecule. Examples of cycloalkyl include, but are not limited to, cyclopentyl, cyclohexyl, 1-cyclohexenyl, 3-cyclohexenyl, cycloheptyl, and the like. Examples of heterocycloalkyl include, but are not limited to, 1-(1,2,5,6-tetrahydropyridyl), 1-piperidinyl, 2-piperidinyl, 3-piperidinyl, 4-morpholinyl, 3-morpholinyl, tetrahydrofuran-2-yl, tetrahydrofuran-3-yl, tetrahydrothien-2-yl, tetrahydrothien-3-yl, 1-piperazinyl, 2-piperazinyl, and the like. The heteroatoms and carbon atoms of the cyclic structures are optionally oxidized.

The terms "halo" or "halogen," by themselves or as part of another substituent, mean, unless otherwise stated, a fluorine, chlorine, bromine, or iodine atom. Additionally, terms such as "haloalkyl," are meant to include monohaloalkyl and polyhaloalkyl. For example, the term "halo(C₁-C₄)alkyl" is meant to include, but not be limited to, trifluoromethyl, 2,2,2-trifluoroethyl, 4-chlorobutyl, 3-bromopropyl, and the like.

The term "aryl" means, unless otherwise stated, a substituted or unsubstituted polyunsaturated, aromatic, hydrocarbon substituent which can be a single ring or multiple rings (preferably from 1 to 3 rings) which are fused together or linked covalently. The term "heteroaryl" refers to aryl groups (or rings) that contain from one to four heteroatoms

selected from N, O, and S, wherein the nitrogen, carbon and sulfur atoms are optionally oxidized, and the nitrogen atom(s) are optionally quaternized. A heteroaryl group can be attached to the remainder of the molecule through a heteroatom. Non-limiting examples of aryl and heteroaryl groups include phenyl, 1-naphthyl, 2-naphthyl, 4-biphenyl, 1-pyrrolyl, 2-
 5 pyrrolyl, 3-pyrrolyl, 3-pyrazolyl, 2-imidazolyl, 4-imidazolyl, pyrazinyl, 2-oxazolyl, 4-oxazolyl, 2-phenyl-4-oxazolyl, 5-oxazolyl, 3-isoxazolyl, 4-isoxazolyl, 5-isoxazolyl, 2-thiazolyl, 4-thiazolyl, 5-thiazolyl, 2-furyl, 3-furyl, 2-thienyl, 3-thienyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, 2-pyrimidyl, 4-pyrimidyl, 5-benzothiazolyl, purinyl, 2-benzimidazolyl, 5-indolyl, 1-isoquinolyl, 5-isoquinolyl, 2-quinoxalyl, 5-quinoxalyl, 3-quinolyl, and 6-quinolyl.

10 Substituents for each of the above noted aryl and heteroaryl ring systems are selected from the group of acceptable substituents described below. "Aryl" and "heteroaryl" also encompass ring systems in which one or more non-aromatic ring systems are fused, or otherwise bound, to an aryl or heteroaryl system.

For brevity, the term "aryl" when used in combination with other terms (*e.g.*,
 15 aryloxy, arylthioxy, arylalkyl) includes both aryl and heteroaryl rings as defined above. Thus, the term "arylalkyl" is meant to include those radicals in which an aryl group is attached to an alkyl group (*e.g.*, benzyl, phenethyl, pyridylmethyl and the like) including those alkyl groups in which a carbon atom (*e.g.*, a methylene group) has been replaced by, for example, an oxygen atom (*e.g.*, phenoxymethyl, 2-pyridyloxymethyl, 3-(1-
 20 naphthyloxy)propyl, and the like).

Each of the above terms (*e.g.*, "alkyl," "heteroalkyl," "aryl" and "heteroaryl") include both substituted and unsubstituted forms of the indicated radical. Preferred substituents for each type of radical are provided below.

Substituents for the alkyl, and heteroalkyl radicals (including those groups
 25 often referred to as alkylene, alkenyl, heteroalkylene, heteroalkenyl, alkynyl, cycloalkyl, heterocycloalkyl, cycloalkenyl, and heterocycloalkenyl) are generally referred to as "alkyl substituents" and "heteroalkyl substituents," respectively, and they can be one or more of a variety of groups selected from, but not limited to: -OR', =O, =NR', =N-OR', -NR'R'', -SR', -halogen, -SiR'R''R''', -OC(O)R', -C(O)R', -CO₂R', -CONR'R'', -OC(O)NR'R'', -
 30 NR''C(O)R', -NR'-C(O)NR''R''', -NR''C(O)₂R', -NR-C(NR'R''R''')=NR''', -NR-C(NR'R'')=NR''', -S(O)R', -S(O)₂R', -S(O)₂NR'R'', -NRSO₂R', -CN and -NO₂ in a

number ranging from zero to $(2m'+1)$, where m' is the total number of carbon atoms in such radical. R' , R'' , R''' and R'''' each preferably independently refer to hydrogen, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, e.g., aryl substituted with 1-3 halogens, substituted or unsubstituted alkyl, alkoxy or thioalkoxy groups, or arylalkyl groups.

5 When a compound of the invention includes more than one R group, for example, each of the R groups is independently selected as are each R' , R'' , R''' and R'''' groups when more than one of these groups is present. When R' and R'' are attached to the same nitrogen atom, they can be combined with the nitrogen atom to form a 5-, 6-, or 7-membered ring. For example, $-NR'R''$ is meant to include, but not be limited to, 1-pyrrolidinyl and 4-morpholinyl. From
 10 the above discussion of substituents, one of skill in the art will understand that the term "alkyl" is meant to include groups including carbon atoms bound to groups other than hydrogen groups, such as haloalkyl (e.g., $-CF_3$ and $-CH_2CF_3$) and acyl (e.g., $-C(O)CH_3$, $-C(O)CF_3$, $-C(O)CH_2OCH_3$, and the like).

Similar to the substituents described for the alkyl radical, the aryl substituents
 15 and heteroaryl substituents are generally referred to as "aryl substituents" and "heteroaryl substituents," respectively and are varied and selected from, for example: halogen, $-OR'$, $=O$, $=NR'$, $=N-OR'$, $-NR'R''$, $-SR'$, -halogen, $-SiR'R''R'''$, $-OC(O)R'$, $-C(O)R'$, $-CO_2R'$, $-CONR'R''$, $-OC(O)NR'R''$, $-NR''C(O)R'$, $-NR'-C(O)NR''R'''$, $-NR''C(O)_2R'$, $-NR-C(NR'R'')=NR'''$, $-S(O)R'$, $-S(O)_2R'$, $-S(O)_2NR'R''$, $-NRSO_2R'$, $-CN$ and $-NO_2$, $-R'$,
 20 $-N_3$, $-CH(Ph)_2$, fluoro(C_1-C_4)alkoxy, and fluoro(C_1-C_4)alkyl, in a number ranging from zero to the total number of open valences on the aromatic ring system; and where R' , R'' , R''' and R'''' are preferably independently selected from hydrogen, (C_1-C_8)alkyl and heteroalkyl, unsubstituted aryl and heteroaryl, (unsubstituted aryl)-(C_1-C_4)alkyl, and (unsubstituted aryl)oxy-(C_1-C_4)alkyl. When a compound of the invention includes more than one R group,
 25 for example, each of the R groups is independently selected as are each R' , R'' , R''' and R'''' groups when more than one of these groups is present.

Two of the aryl substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula $-T-C(O)-(CRR')_q-U-$, wherein
 30 T and U are independently $-NR-$, $-O-$, $-CRR'-$ or a single bond, and q is an integer of from 0 to 3. Alternatively, two of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula $-A-(CH_2)_r-B-$, wherein A and B

are independently $-\text{CRR}'-$, $-\text{O}-$, $-\text{NR}'-$, $-\text{S}-$, $-\text{S}(\text{O})-$, $-\text{S}(\text{O})_2-$, $-\text{S}(\text{O})_2\text{NR}'-$ or a single bond, and r is an integer of from 1 to 4. One of the single bonds of the new ring so formed may optionally be replaced with a double bond. Alternatively, two of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula $-(\text{CRR}')_s-\text{X}-(\text{CR}''\text{R}''')_d-$, where s and d are independently integers of from 0 to 3, and X is $-\text{O}-$, $-\text{NR}'-$, $-\text{S}-$, $-\text{S}(\text{O})-$, $-\text{S}(\text{O})_2-$, or $-\text{S}(\text{O})_2\text{NR}'-$. The substituents R , R' , R'' and R''' are preferably independently selected from hydrogen or substituted or unsubstituted (C_1-C_6) alkyl.

As used herein, the term “diphosphate” includes but is not limited to an ester of phosphoric acid containing two phosphate groups. The term “triphosphate” includes but is not limited to an ester of phosphoric acid containing three phosphate groups. For example, particular drugs having a diphosphate or a triphosphate include:

As used herein, the term “heteroatom” includes oxygen (O), nitrogen (N), sulfur (S) and silicon (Si).

The symbol “R” is a general abbreviation that represents a substituent group that is selected from substituted or unsubstituted alkyl, substituted or unsubstituted

heteroalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, and substituted or unsubstituted heterocyclyl groups.

The term "pharmaceutically acceptable carrier", as used herein means a pharmaceutically-acceptable material, composition or vehicle, such as a liquid or solid filler, diluent, excipient, solvent or encapsulating material, involved in carrying or transporting a chemical agent. Pharmaceutically acceptable carriers include pharmaceutically acceptable salts, where the term "pharmaceutically acceptable salts" includes salts of the active compounds which are prepared with relatively nontoxic acids or bases, depending on the particular substituents found on the compounds described herein. When compounds of the present invention contain relatively acidic functionalities, base addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired base, either neat or in a suitable inert solvent. Examples of pharmaceutically acceptable base addition salts include sodium, potassium, calcium, ammonium, organic amino, or magnesium salt, or a similar salt. When compounds of the present invention contain relatively basic functionalities, acid addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired acid, either neat or in a suitable inert solvent. Examples of pharmaceutically acceptable acid addition salts include those derived from inorganic acids like hydrochloric, hydrobromic, nitric, carbonic, monohydrogencarbonic, phosphoric, monohydrogenphosphoric, dihydrogenphosphoric, sulfuric, monohydrogensulfuric, hydriodic, or phosphorous acids and the like, as well as the salts derived from relatively nontoxic organic acids like acetic, propionic, isobutyric, maleic, malonic, benzoic, succinic, suberic, fumaric, lactic, mandelic, phthalic, benzenesulfonic, p-tolylsulfonic, citric, tartaric, methanesulfonic, and the like. Also included are salts of amino acids such as arginate and the like, and salts of organic acids like glucuronic or galactunoric acids and the like (*see*, for example, Berge *et al.*, "Pharmaceutical Salts", *Journal of Pharmaceutical Science*, 1977, 66, 1-19). Certain specific compounds of the present invention contain both basic and acidic functionalities that allow the compounds to be converted into either base or acid addition salts.

The neutral forms of the compounds are preferably regenerated by contacting the salt with a base or acid and isolating the parent compound in the conventional manner. The parent form of the compound differs from the various salt forms in certain physical

properties, such as solubility in polar solvents, but otherwise the salts are equivalent to the parent form of the compound for the purposes of the present invention.

In addition to salt forms, the present invention provides compounds, which are in a prodrug form. Prodrugs of the compounds described herein are those compounds that readily undergo chemical changes under physiological conditions to provide the compounds of the present invention. Additionally, prodrugs can be converted to the compounds of the present invention by chemical or biochemical methods in an *ex vivo* environment. For example, prodrugs can be slowly converted to the compounds of the present invention when placed in a transdermal patch reservoir with a suitable enzyme or chemical reagent.

Certain compounds of the present invention can exist in unsolvated forms as well as solvated forms, including hydrated forms. In general, the solvated forms are equivalent to unsolvated forms and are encompassed within the scope of the present invention. Certain compounds of the present invention may exist in multiple crystalline or amorphous forms. In general, all physical forms are equivalent for the uses contemplated by the present invention and are intended to be within the scope of the present invention.

Certain compounds of the present invention possess asymmetric carbon atoms (optical centers) or double bonds; the racemates, diastereomers, geometric isomers and individual isomers are encompassed within the scope of the present invention.

The compounds of the present invention may also contain unnatural proportions of atomic isotopes at one or more of the atoms that constitute such compounds. For example, the compounds may be radiolabeled with radioactive isotopes, such as for example tritium (^3H), iodine-125 (^{125}I) or carbon-14 (^{14}C). All isotopic variations of the compounds of the present invention, whether radioactive or not, are intended to be encompassed within the scope of the present invention.

The term "attaching moiety" or "moiety for attaching a targeting group" refers to a moiety which allows for attachment of a targeting group to the linker. Typical attaching groups include, by way of illustration and not limitation, alkyl, aminoalkyl, aminocarbonylalkyl, carboxyalkyl, hydroxyalkyl, alkyl-maleimide, alkyl-N-hydroxylsuccinimide, poly(ethylene glycol)-maleimide and poly(ethylene glycol)-N-hydroxylsuccinimide, all of which may be further substituted. The linker can also have the attaching moiety be actually appended to the targeting group.

As used herein, the term "leaving group" refers to a portion of a substrate that is cleaved from the substrate in a reaction.

The term "antibody" as referred to herein includes whole antibodies and any antigen binding fragment (*i.e.*, "antigen-binding portion") or single chains thereof. An "antibody" refers to a glycoprotein comprising at least two heavy (H) chains and two light (L) chains inter-connected by disulfide bonds, or an antigen binding portion thereof. Each heavy chain is comprised of a heavy chain variable region (V_H) and a heavy chain constant region. The heavy chain constant region is comprised of three domains, C_{H1} , C_{H2} and C_{H3} , and may be of the mu, delta, gamma, alpha or epsilon isotype. Each light chain is comprised of a light chain variable region (V_L) and a light chain constant region. The light chain constant region is comprised of one domain, C_L , which may be of the kappa or lambda isotype. The V_H and V_L regions can be further subdivided into regions of hypervariability, termed complementarity determining regions (CDR), interspersed with regions that are more conserved, termed framework regions (FR). Each V_H and V_L is composed of three CDRs and four FRs, arranged from amino-terminus to carboxy-terminus in the following order: FR1, CDR1, FR2, CDR2, FR3, CDR3, FR4. The variable regions of the heavy and light chains contain a binding domain that interacts with an antigen. The constant regions of the antibodies may mediate the binding of the immunoglobulin to host tissues or factors, including various cells of the immune system (*e.g.*, effector cells) and the first component (C1q) of the classical complement system.

The terms "antibody fragment" or "antigen-binding portion" of an antibody (or simply "antibody portion"), as used herein, refers to one or more fragments of an antibody that retain the ability to specifically bind to an antigen. It has been shown that the antigen-binding function of an antibody can be performed by fragments of a full-length antibody. Examples of binding fragments encompassed within the term "antibody fragment" or "antigen-binding portion" of an antibody include (i) a Fab fragment, a monovalent fragment consisting of the V_L , V_H , C_L and C_{H1} domains; (ii) a $F(ab')_2$ fragment, a bivalent fragment comprising two Fab fragments linked by a disulfide bridge at the hinge region; (iii) a Fd fragment consisting of the V_H and C_{H1} domains; (iv) a Fv fragment consisting of the V_L and V_H domains of a single arm of an antibody, (v) a dAb fragment (Ward *et al.*, (1989) *Nature*

341:544-546), which consists of a V_H domain; and (vi) an isolated complementarity determining region (CDR). Furthermore, although the two domains of the Fv fragment, V_L and V_H, are coded for by separate genes, they can be joined, using recombinant methods, by a synthetic linker that enables them to be made as a single protein chain in which the V_L and V_H regions pair to form monovalent molecules (known as single chain Fv (scFv); see e.g., Bird *et al.* (1988) *Science* 242:423-426; and Huston *et al.* (1988) *Proc. Natl. Acad. Sci. USA* 85:5879-5883). Such single chain antibodies are also intended to be encompassed within the term "antigen-binding portion" of an antibody. These antibody fragments are obtained using conventional techniques known to those with skill in the art, and the fragments are screened for utility in the same manner as are intact antibodies.

The terms "monoclonal antibody" as used herein refers to a preparation of antibody molecules of single molecular composition. A monoclonal antibody composition displays a single binding specificity and affinity for a particular epitope.

For preparation of monoclonal or polyclonal antibodies, any technique known in the art can be used (see, e.g., Kohler & Milstein, *Nature* 256:495-497 (1975); Kozbor *et al.*, *Immunology Today* 4: 72 (1983); Cole *et al.*, pp. 77-96 in MONOCLONAL ANTIBODIES AND CANCER THERAPY, Alan R. Liss, Inc. (1985)).

Methods of production of polyclonal antibodies are known to those of skill in the art. An inbred strain of mice (e.g., BALB/C mice) or rabbits is immunized with the protein using a standard adjuvant, such as Freund's adjuvant, and a standard immunization protocol. The animal's immune response to the immunogen preparation is monitored by taking test bleeds and determining the titer of reactivity to the beta subunits. When appropriately high titers of antibody to the immunogen are obtained, blood is collected from the animal and antisera are prepared. Further fractionation of the antisera to enrich for antibodies reactive to the protein can be done if desired.

Monoclonal antibodies may be obtained by various techniques familiar to those skilled in the art. Briefly, spleen cells from an animal immunized with a desired antigen are immortalized, commonly by fusion with a myeloma cell (see Kohler & Milstein, *Eur. J. Immunol.* **6**: 511-519 (1976)). Alternative methods of immortalization include transformation with Epstein Barr Virus, oncogenes, or retroviruses, or other methods well known in the art.

In a preferred embodiment, the antibody is a chimeric or humanized antibody. Chimeric or humanized antibodies of the present invention can be prepared based on the sequence of a murine monoclonal antibody. DNA encoding the heavy and light chain immunoglobulins can be obtained from the murine hybridoma of interest and engineered to
5 contain non-murine (*e.g.*, human) immunoglobulin sequences using standard molecular biology techniques. For example, to create a chimeric antibody, the murine variable regions can be linked to human constant regions using methods known in the art (see *e.g.*, U.S. Patent No. 4,816,567 to Cabilly *et al.*). To create a humanized antibody, the murine CDR regions can be inserted into a human framework using methods known in the art (see *e.g.*,
10 U.S. Patent No. 5,225,539 to Winter, and U.S. Patent Nos. 5,530,101; 5,585,089; 5,693,762 and 6,180,370 to Queen *et al.*).

In another preferred embodiment, the antibody is a human antibody. Such human antibodies can be generated by immunizing transgenic or transchromosomal mice in which the endogenous mouse immunoglobulin genes have been inactivated and exogenous
15 human immunoglobulin genes have been introduced. Such mice are known in the art (see *e.g.*, U.S. Patent Nos. 5,545,806; 5,569,825; 5,625,126; 5,633,425; 5,789,650; 5,877,397; 5,661,016; 5,814,318; 5,874,299; and 5,770,429; all to Lonberg and Kay; U.S. Patent Nos. 5,939,598; 6,075,181; 6,114,598; 6,150,584 and 6,162,963 to Kucherlapati *et al.*) Human antibodies can also be prepared using
20 phage display methods for screening libraries of human immunoglobulin genes. Such phage display methods for isolating human antibodies also are known in the art (see *e.g.*, U.S. Patent Nos. 5,223,409; 5,403,484; and 5,571,698 to Ladner *et al.*; U.S. Patent Nos. 5,427,908 and 5,580,717 to Dower *et al.*; U.S. Patent Nos. 5,969,108 and 6,172,197 to McCafferty *et al.*; and U.S. Patent Nos. 5,885,793; 6,521,404; 6,544,731; 6,555,313; 6,582,915 and 6,593,081
25 to Griffiths *et al.*).

“Solid support,” as used herein refers to a material that is substantially insoluble in a selected solvent system, or which can be readily separated (*e.g.*, by precipitation) from a selected solvent system in which it is soluble. Solid supports useful in practicing the present invention can include groups that are activated or capable of activation
30 to allow selected species to be bound to the solid support. A solid support can also be a

substrate, for example, a chip, wafer or well, onto which an individual, or more than one compound, of the invention is bound.

“Reactive functional group,” as used herein refers to groups including, but not limited to, olefins, acetylenes, alcohols, phenols, ethers, oxides, halides, aldehydes, ketones, 5 carboxylic acids, esters, amides, cyanates, isocyanates, thiocyanates, isothiocyanates, amines, hydrazines, hydrazones, hydrazides, diazo, diazonium, nitro, nitriles, mercaptans, sulfides, disulfides, sulfoxides, sulfones, sulfonic acids, sulfinic acids, acetals, ketals, anhydrides, sulfates, sulfenic acids isonitriles, amidines, imides, imidates, nitrones, hydroxylamines, oximes, hydroxamic acids thiohydroxamic acids, allenes, ortho esters, sulfites, enamines, 10 ynamines, ureas, pseudoureas, semicarbazides, carbodiimides, carbamates, imines, azides, azo compounds, azoxy compounds, and nitroso compounds. Reactive functional groups also include those used to prepare bioconjugates, e.g., N-hydroxysuccinimide esters, maleimides and the like (*see*, for example, Hermanson, BIOCONJUGATE TECHNIQUES, Academic press, San Diego, 1996). Methods to prepare each of these functional groups are well known in the 15 art and their application to or modification for a particular purpose is within the ability of one of skill in the art (*see*, for example, Sandler and Karo, eds. ORGANIC FUNCTIONAL GROUP PREPARATIONS, Academic Press, San Diego, 1989). The reactive functional groups may be protected or unprotected.

The compounds of the invention are prepared as a single isomer (*e.g.*, 20 enantiomer, cis-trans, positional, diastereomer) or as a mixture of isomers. In a preferred embodiment, the compounds are prepared as substantially a single isomer. Methods of preparing substantially isomerically pure compounds are known in the art. For example, enantiomerically enriched mixtures and pure enantiomeric compounds can be prepared by using synthetic intermediates that are enantiomerically pure in combination with reactions 25 that either leave the stereochemistry at a chiral center unchanged or result in its complete inversion. Alternatively, the final product or intermediates along the synthetic route can be resolved into a single stereoisomer. Techniques for inverting or leaving unchanged a particular stereocenter, and those for resolving mixtures of stereoisomers are well known in the art and it is well within the ability of one of skill in the art to choose and appropriate 30 method for a particular situation. *See*, generally, Furniss *et al.* (eds.), VOGEL'S

ENCYCLOPEDIA OF PRACTICAL ORGANIC CHEMISTRY 5TH ED., Longman Scientific and Technical Ltd., Essex, 1991, pp. 809-816; and Heller, *Acc. Chem. Res.* **23**: 128 (1990).

LINKERS

5 The present invention provides for drug-ligand conjugates where the drug is linked to the ligand through a chemical linker including, but not limited to, those disclosed in U.S. Patent Application Serial No. 11/134,826 and U.S. Provisional Patent Applications Serial Nos. 60/572,667 and 60/661,174, all of which are herein incorporated by reference. This linker is either a peptidyl, hydrazine, or disulfide linker, and is depicted herein as
10 $(L^4)_p-F-(L^1)_m$, $(L^4)_p-H-(L^1)_m$, or $(L^4)_p-J-(L^1)_m$, respectively. In addition to the linkers as being attached to the drug, the present invention also provides cleaveable linker arms that are appropriate for attachment to essentially any molecular species. The linker arm aspect of the invention is exemplified herein by reference to their attachment to a therapeutic moiety. It will, however, be readily apparent to those of skill in the art that the linkers can be
15 attached to diverse species including, but not limited to, diagnostic agents, analytical agents, biomolecules, targeting agents, detectable labels and the like.

 In one aspect, the present invention relates to linkers that are useful to attach targeting groups to therapeutic agents and markers. In another aspect, the invention provides linkers that impart stability to compounds, reduce their *in vivo* toxicity, or otherwise
20 favorably affect their pharmacokinetics, bioavailability and/or pharmacodynamics. It is generally preferred that in such embodiments, the linker is cleaved, releasing the active drug, once the drug is delivered to its site of action. Thus, in one embodiment of the invention, the linkers of the invention are traceless, such that once removed from the therapeutic agent or marker (such as during activation), no trace of the linker's presence remains.

25 In another embodiment of the invention, the linkers are characterized by their ability to be cleaved at a site in or near the target cell such as at the site of therapeutic action or marker activity. Such cleavage can be enzymatic in nature. This feature aids in reducing systemic activation of the therapeutic agent or marker, reducing toxicity and systemic side effects. Preferred cleaveable groups for enzymatic cleavage include peptide bonds, ester
30 linkages, and disulfide linkages. In other embodiments, the linkers are sensitive to pH and are cleaved through changes in pH.

An important aspect of the current invention is the ability to control the speed with which the linkers cleave. For example, the hydrazine linkers described herein are particularly useful because, depending on which particular structure is used, one can vary the speed at which the linker cyclizes and thereby cleaves the drug from the ligand. WO 02/096910 provides several specific ligand-drug complexes having a hydrazine linker. However, there is no way to "tune" the linker composition dependent upon the rate of cyclization required, and the particular compounds described cleave the ligand from the drug at a slower rate than is preferred for many drug-linker conjugates. In contrast, the hydrazine linkers of the current invention provide for a range of cyclization rates, from very fast to very slow, thereby allowing for the selection of a particular hydrazine linker based on the desired rate of cyclization. For example, very fast cyclization can be achieved with hydrazine linkers that produce a single 5-membered ring upon cleavage. Preferred cyclization rates for targeted delivery of a cytotoxic agent to cells are achieved using hydrazine linkers that produce, upon cleavage, either two 5-membered rings or a single 6-membered ring resulting from a linker having two methyls at the geminal position. The *gem*-dimethyl effect has been shown to accelerate the rate of the cyclization reaction as compared to a single 6-membered ring without the two methyls at the geminal position. This results from the strain being relieved in the ring. Sometimes, however, substituents may slow down the reaction instead of making it faster. Often the reasons for the retardation can be traced to steric hindrance. As shown in Example 2.4, the *gem* dimethyl substitution allows for a much faster cyclization reaction to occur compared to when the geminal carbon is a CH₂.

It is important to note, however, that in some embodiments, a linker that cleaves more slowly may be preferred. For example, in a sustained release formulation or in a formulation with both a quick release and a slow release component, it may be useful to provide a linker which cleaves more slowly. In certain embodiments, a slow rate of cyclization is achieved using a hydrazine linker that produces, upon cleavage, either a single 6-membered ring, without the *gem*-dimethyl substitution, or a single 7-membered ring.

The linkers also serve to stabilize the therapeutic agent or marker against degradation while in circulation. This feature provides a significant benefit since such stabilization results in prolonging the circulation half-life of the attached agent or marker. The linker also serves to attenuate the activity of the attached agent or marker so that the

conjugate is relatively benign while in circulation and has the desired effect, for example is toxic, after activation at the desired site of action. For therapeutic agent conjugates, this feature of the linker serves to improve the therapeutic index of the agent.

5 The stabilizing groups are preferably selected to limit clearance and metabolism of the therapeutic agent or marker by enzymes that may be present in blood or non-target tissue and are further selected to limit transport of the agent or marker into the cells. The stabilizing groups serve to block degradation of the agent or marker and may also act in providing other physical characteristics of the agent or marker. The stabilizing group may also improve the agent or marker's stability during storage in either a formulated or non-
10 formulated form.

Ideally, the stabilizing group is useful to stabilize a therapeutic agent or marker if it serves to protect the agent or marker from degradation when tested by storage of the agent or marker in human blood at 37°C for 2 hours and results in less than 20%, preferably less than 10%, more preferably less than 5% and even more preferably less than
15 2%, cleavage of the agent or marker by the enzymes present in the human blood under the given assay conditions.

The present invention also relates to conjugates containing these linkers. More particularly, the invention relates to prodrugs that may be used for the treatment of disease, especially for cancer chemotherapy. Specifically, use of the linkers described herein
20 provide for prodrugs that display a high specificity of action, a reduced toxicity, and an improved stability in blood relative to prodrugs of similar structure.

The linkers of the present invention as described herein may be present at any position within the cytotoxic conjugate.

Thus, there is provided a linker that may contain any of a variety of groups as
25 part of its chain that will cleave *in vivo*, e.g., in the blood stream at a rate which is enhanced relative to that of constructs that lack such groups. Also provided are conjugates of the linker arms with therapeutic and diagnostic agents. The linkers are useful to form prodrug analogs of therapeutic agents and to reversibly link a therapeutic or diagnostic agent to a targeting agent, a detectable label, or a solid support. The linkers may be incorporated into complexes
30 that include the cytotoxins of the invention.

In addition to the cleaveable peptide, hydrazine, or disulfide group, one or more self-immolative linker groups L^1 are optionally introduced between the cytotoxin and the targeting agent. These linker groups may also be described as spacer groups and contain at least two reactive functional groups. Typically, one chemical functionality of the spacer group bonds to a chemical functionality of the therapeutic agent, *e.g.*, cytotoxin, while the other chemical functionality of the spacer group is used to bond to a chemical functionality of the targeting agent or the cleaveable linker. Examples of chemical functionalities of spacer groups include hydroxy, mercapto, carbonyl, carboxy, amino, ketone, and mercapto groups.

The self-immolative linkers, represented by L^1 , are generally substituted or unsubstituted alkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl or a substituted or unsubstituted heteroalkyl group. In one embodiment, the alkyl or aryl groups may comprise between 1 and 20 carbon atoms. They may also comprise a polyethylene glycol moiety.

Exemplary spacer groups include, for example, 6-aminohexanol, 6-mercaptohexanol, 10-hydroxydecanoic acid, glycine and other amino acids, 1,6-hexanediol, β -alanine, 2-aminoethanol, cysteamine (2-aminoethanethiol), 5-aminopentanoic acid, 6-aminohexanoic acid, 3-maleimidobenzoic acid, phthalide, α -substituted phthalides, the carbonyl group, aminal esters, nucleic acids, peptides and the like.

The spacer can serve to introduce additional molecular mass and chemical functionality into the cytotoxin-targeting agent complex. Generally, the additional mass and functionality will affect the serum half-life and other properties of the complex. Thus, through careful selection of spacer groups, cytotoxin complexes with a range of serum half-lives can be produced.

The spacer(s) located directly adjacent to the drug moiety is also denoted as $(L^1)_m$, wherein m is an integer selected from 0, 1, 2, 3, 4, 5, or 6. When multiple L^1 spacers are present, either identical or different spacers may be used. L^1 may be any self-immolative group. In one embodiment, L^1 is preferably is a substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted heteroalkyl, unsubstituted heterocycloalkyl, and substituted heterocycloalkyl. When the drug-ligand conjugate comprises a hydrazine linker, L^1 does not comprise a disulfide bond.

L⁴ is a linker moiety that imparts increased solubility or decreased aggregation properties to conjugates utilizing a linker that contains the moiety. The L⁴ linker does not have to be self immolative. In one embodiment, the L⁴ moiety is substituted alkyl, unsubstituted alkyl, substituted aryl, unsubstituted aryl, substituted heteroalkyl, or unsubstituted heteroalkyl, any of which may be straight, branched, or cyclic. The substitutions may be, for example, a lower (C¹-C⁶) alkyl, alkoxy, alkylthio, alkylamino, or dialkylamino. In certain embodiments, L⁴ comprises a non-cyclic moiety. In another embodiment, L⁴ comprises any positively or negatively charged amino acid polymer, such as polylysine or polyarginine. L⁴ can comprise a polymer such as a polyethylene glycol moiety. Additionally the L⁴ linker comprises, for example, both a polymer component and a small chemical moiety.

In a preferred embodiment, L⁴ comprises a polyethylene glycol (PEG) moiety. The PEG portion of L⁴ may be between 1 and 50 units long. Preferably, the PEG will have 1-12 repeat units, more preferably 3-12 repeat units, more preferably 2-6 repeat units, or even more preferably 3-5 repeat units and most preferably 4 repeat units. L⁴ may consist solely of the PEG moiety, or it may also contain an additional substituted or unsubstituted alkyl or heteroalkyl. It is useful to combine PEG as part of the L⁴ moiety to enhance the water solubility of the complex. Additionally, the PEG moiety reduces the degree of aggregation that may occur during the conjugation of the drug to the antibody.

(1) Peptide Linkers (F)

As discussed above, the peptidyl linkers of the invention can be represented by the general formula: (L⁴)_p—F—(L¹)_m, wherein F represents the linker portion comprising the peptidyl moiety. In one embodiment, the F portion comprises an optional additional self-immolative linker(s), L², and a carbonyl group. In another embodiment, the F portion comprises an amino group and an optional spacer group(s), L³.

Accordingly, in one embodiment, the conjugate comprising the peptidyl linker comprises a structure of the Formula 4:

In this embodiment, L^1 is a self-immolative linker, as described above, and L^4 is a moiety that imparts increased solubility, or decreased aggregation properties, as described above. L^2 represents a self-immolative linker(s). m is 0, 1, 2, 3, 4, 5, or 6; o and p are independently 0 or 1. In one embodiment, m is 3, 4, 5 or 6. AA^1 represents one or more natural amino acids, and/or unnatural α -amino acids; c is an integer between 1 and 20.

In the peptide linkers of the invention of the above Formula 4, AA^1 is linked, at its amino terminus, either directly to L^4 or, when L^4 is absent, directly to the X^4 group (*i.e.*, the targeting agent, detectable label, protected reactive functional group or unprotected reactive functional group). In some embodiments, when L^4 is present, L^4 does not comprise a carboxylic acyl group directly attached to the N-terminus of $(AA^1)_c$. Thus, it is not necessary in these embodiments for there to be a carboxylic acyl unit directly between either L^4 or X^4 and AA^1 , as is necessary in the peptidic linkers of U.S. Patent No. 6,214,345.

In another embodiment, the conjugate comprising the peptidyl linker comprises a structure of the Formula 5:

In this embodiment, L^4 is a moiety that imparts increased solubility, or decreased aggregation properties, as described above; L^3 is a spacer group comprising a primary or secondary amine or a carboxyl functional group, and either the amine of L^3 forms an amide bond with a pendant carboxyl functional group of D or the carboxyl of L^3 forms an amide bond with a pendant amine functional group of D; and o and p are independently 0 or 1. AA^1 represents one or more natural amino acids, and/or unnatural α -amino acids; c is an

integer between 1 and 20. In this embodiment, L^1 is absent (*i.e.*, m is 0 is the general formula).

In the peptide linkers of the invention of the above Formula 5, AA^1 is linked, at its amino terminus, either directly to L^4 or, when L^4 is absent, directly to the X^4 group (*i.e.*, the targeting agent, detectable label, protected reactive functional group or unprotected reactive functional group). In some embodiments, when L^4 is present, L^4 does not comprise a carboxylic acyl group directly attached to the N-terminus of $(AA^1)_c$. Thus, it is not necessary in these embodiments for there to be a carboxylic acyl unit directly between either L^4 or X^4 and AA^1 , as is necessary in the peptidic linkers of U.S. Patent No. 6,214,345.

The self-immolative linker L^2

The self-immolative linker L^2 is a bifunctional chemical moiety which is capable of covalently linking together two spaced chemical moieties into a normally stable tripartate molecule, releasing one of said spaced chemical moieties from the tripartate molecule by means of enzymatic cleavage; and following said enzymatic cleavage, spontaneously cleaving from the remainder of the molecule to release the other of said spaced chemical moieties. In accordance with the present invention, the self-immolative spacer is covalently linked at one of its ends to the peptide moiety and covalently linked at its other end to the chemical reactive site of the drug moiety whose derivatization inhibits pharmacological activity, so as to space and covalently link together the peptide moiety and the drug moiety into a tripartate molecule which is stable and pharmacologically inactive in the absence of the target enzyme, but which is enzymatically cleavable by such target enzyme at the bond covalently linking the spacer moiety and the peptide moiety to thereby effect release of the peptide moiety from the tripartate molecule. Such enzymatic cleavage, in turn, will activate the self-immolating character of the spacer moiety and initiate spontaneous cleavage of the bond covalently linking the spacer moiety to the drug moiety, to thereby effect release of the drug in pharmacologically active form.

The self-immolative linker L^2 may be any self-immolative group. Preferably L^2 is a substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, unsubstituted heterocycloalkyl, substituted heterocycloalkyl, substituted and unsubstituted aryl, and substituted and unsubstituted heteroaryl.

One particularly preferred self-immolative spacer L^2 may be represented by the formula 6:

(6)

5

The aromatic ring of the aminobenzyl group may be substituted with one or more "K" groups. A "K" group is a substituent on the aromatic ring that replaces a hydrogen otherwise attached to one of the four non-substituted carbons that are part of the ring structure. The "K" group may be a single atom, such as a halogen, or may be a multi-atom group, such as alkyl, heteroalkyl, amino, nitro, hydroxy, alkoxy, haloalkyl, and cyano. Each K is independently selected from the group consisting of substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl, unsubstituted heterocycloalkyl, halogen, NO_2 , $\text{NR}^{21}\text{R}^{22}$, $\text{NR}^{21}\text{COR}^{22}$, $\text{OCONR}^{21}\text{R}^{22}$, OCOR^{21} , and OR^{21} , where R^{21} and R^{22} are independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl and unsubstituted heterocycloalkyl. Exemplary K substituents include, but are not limited to, F, Cl, Br, I, NO_2 , OH, OCH_3 , NHCOCH_3 , $\text{N}(\text{CH}_3)_2$, NHCOCF_3 and methyl. For "Ka", a is an integer of 0, 1, 2, 3, or 4. In one preferred embodiment, a is 0.

10

15

20

25

The ether oxygen atom of the structure shown above is connected to a carbonyl group. The line from the NR^{24} functionality into the aromatic ring indicates that the amine functionality may be bonded to any of the five carbons that both form the ring and are not substituted by the $-\text{CH}_2-\text{O}-$ group. Preferably, the NR^{24} functionality of X is covalently bound to the aromatic ring at the para position relative to the $-\text{CH}_2-\text{O}-$ group. R^{24} is a member selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted heteroalkyl. In a specific embodiment, R^{24} is hydrogen.

In a preferred embodiment, the invention provides a peptide linker of formula (4) above, wherein F comprises the structure:

5

wherein

R^{24} is selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted heteroalkyl;

10

Each K is a member independently selected from the group consisting of substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl, unsubstituted heterocycloalkyl, halogen, NO_2 , $\text{NR}^{21}\text{R}^{22}$, $\text{NR}^{21}\text{COR}^{22}$, $\text{OCONR}^{21}\text{R}^{22}$, OCOR^{21} , and OR^{21}

15

wherein

R^{21} and R^{22} are independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl, unsubstituted heterocycloalkyl; and

20

a is an integer of 0, 1, 2, 3, or 4.

In another embodiment, the peptide linker of formula (4) above comprises a $-\text{F}-(\text{L}^1)_m-$ that comprises the structure:

wherein

each R^{24} is a member independently selected from the group consisting
 5 of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted
 heteroalkyl.

The Spacer Group L^3

The spacer group L^3 is characterized in that it comprises a primary or
 10 secondary amine or a carboxyl functional group, and either the amine of the L^3 group forms
 an amide bond with a pendant carboxyl functional group of D or the carboxyl of L^3 forms an
 amide bond with a pendant amine functional group of D. L^3 can be selected from the group
 consisting of substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl,
 substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, or substituted or
 15 unsubstituted heterocycloalkyl. In a preferred embodiment, L^3 comprises an aromatic group.
 More preferably, L^3 comprises a benzoic acid group, an aniline group or indole group. Non-
 limiting examples of structures that can serve as an $-L^3-NH-$ spacer include the following
 structures:

wherein Z is a member selected from O, S and NR²³, and

wherein R²³ is a member selected from H, substituted or unsubstituted alkyl,

5 substituted or unsubstituted heteroalkyl, and acyl.

Upon cleavage of the linker of the invention containing L³, the L³ moiety remains attached to the drug, D. Accordingly, the L³ moiety is chosen such that its presence attached to D does not significantly alter the activity of D. In another embodiment, a portion of the drug D itself functions as the L³ spacer. For example, in one embodiment, the drug, D, is a duocarmycin derivative in which a portion of the drug functions as the L³ spacer. Non-
 10 limiting examples of such embodiments include those in which NH₂-(L³)-D has a structure selected from the group consisting of:

and

5

wherein Z is a member selected from O, S and NR²³,

wherein R²³ is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl; and

wherein the NH₂ group on each structure reacts with (AA¹)_c to form -(AA¹)_c-NH-

10

The Peptide Sequence AA¹

The group AA¹ represents a single amino acid or a plurality of amino acids that are joined together by amide bonds. The amino acids may be natural amino acids and/or unnatural α -amino acids.

The peptide sequence $(AA^1)_c$ is functionally the amidification residue of a single amino acid (when $c=1$) or a plurality of amino acids joined together by amide bonds. The peptide of the current invention is selected for directing enzyme-catalyzed cleavage of the peptide by an enzyme in a location of interest in a biological system. For example, for
5 conjugates that are targeted to a cell using a targeting agent, and then taken up by the cell, a peptide is chosen that is cleaved by one or more lysosomal proteases such that the peptide is cleaved intracellularly within the lysosome. The number of amino acids within the peptide can range from 1 to 20; but more preferably there will be 2-8 amino acids, 2-6 amino acids or 2, 3 or 4 amino acids comprising $(AA^1)_c$. Peptide sequences that are susceptible to cleavage
10 by specific enzymes or classes of enzymes are well known in the art.

Many peptide sequences that are cleaved by enzymes in the serum, liver, gut, etc. are known in the art. An exemplary peptide sequence of the invention includes a peptide sequence that is cleaved by a protease. The focus of the discussion that follows on the use of a protease-sensitive sequence is for clarity of illustration and does not serve to limit the scope
15 of the present invention.

When the enzyme that cleaves the peptide is a protease, the linker generally includes a peptide containing a cleavage recognition sequence for the protease. A cleavage recognition sequence for a protease is a specific amino acid sequence recognized by the protease during proteolytic cleavage. Many protease cleavage sites are known in the art, and
20 these and other cleavage sites can be included in the linker moiety. *See, e.g., Matayoshi et al. Science* **247**: 954 (1990); Dunn *et al. Meth. Enzymol.* **241**: 254 (1994); Seidah *et al. Meth. Enzymol.* **244**: 175 (1994); Thornberry, *Meth. Enzymol.* **244**: 615 (1994); Weber *et al. Meth. Enzymol.* **244**: 595 (1994); Smith *et al. Meth. Enzymol.* **244**: 412 (1994); Bouvier *et al. Meth. Enzymol.* **248**: 614 (1995), Hardy *et al.*, in *AMYLOID PROTEIN PRECURSOR IN DEVELOPMENT, AGING, AND ALZHEIMER'S DISEASE*, ed. Masters *et al.* pp. 190-198 (1994).
25

The amino acids of the peptide sequence $(AA^1)_c$ are chosen based on their suitability for selective enzymatic cleavage by particular molecules such as tumor-associated protease. The amino acids used may be natural or unnatural amino acids. They may be in the L or the D configuration. In one embodiment, at least three different amino
30 acids are used. In another embodiment, only two amino acids are used.

In a preferred embodiment, the peptide sequence $(AA^1)_c$ is chosen based on its ability to be cleaved by a lysosomal proteases, non-limiting examples of which include cathepsins B, C, D, H, L and S. Preferably, the peptide sequence $(AA^1)_c$ is capable of being cleaved by cathepsin B *in vitro*, which can be tested using *in vitro* protease cleavage assays known in the art.

In another embodiment, the peptide sequence $(AA^1)_c$ is chosen based on its ability to be cleaved by a tumor-associated protease, such as a protease that is found extracellularly in the vicinity of tumor cells, non-limiting examples of which include thimet oligopeptidase (TOP) and CD10. The ability of a peptide to be cleaved by TOP or CD10 can be tested using *in vitro* protease cleavage assays known in the art.

Suitable, but non-limiting, examples of peptide sequences suitable for use in the conjugates of the invention include Val-Cit, Val-Lys, Phe-Lys, Lys-Lys, Ala-Lys, Phe-Cit, Leu-Cit, Ile-Cit, Trp, Cit, Phe-Ala, Phe-N⁹-tosyl-Arg, Phe-N⁹-nitro-Arg, Phe-Phe-Lys, D-Phe-Phe-Lys, Gly-Phe-Lys, Leu-Ala-Leu, Ile-Ala-Leu, Val-Ala-Val, Ala-Leu-Ala-Leu (SEQ ID NO: 1), β -Ala-Leu-Ala-Leu (SEQ ID NO: 2) and Gly-Phe-Leu-Gly (SEQ ID NO: 3). Preferred peptides sequences are Val-Cit and Val-Lys.

In another embodiment, the amino acid located the closest to the drug moiety is selected from the group consisting of: Ala, Asn, Asp, Cit, Cys, Gln, Glu, Gly, Ile, Leu, Lys, Met, Phe, Pro, Ser, Thr, Trp, Tyr, and Val. In yet another embodiment, the amino acid located the closest to the drug moiety is selected from the group consisting of: Ala, Asn, Asp, Cys, Gln, Glu, Gly, Ile, Leu, Met, Phe, Pro, Ser, Thr, Trp, Tyr, and Val.

Proteases have been implicated in cancer metastasis. Increased synthesis of the protease urokinase was correlated with an increased ability to metastasize in many cancers. Urokinase activates plasmin from plasminogen, which is ubiquitously located in the extracellular space and its activation can cause the degradation of the proteins in the extracellular matrix through which the metastasizing tumor cells invade. Plasmin can also activate the collagenases thus promoting the degradation of the collagen in the basement membrane surrounding the capillaries and lymph system thereby allowing tumor cells to invade into the target tissues (Dano, *et al. Adv. Cancer. Res.*, **44**: 139 (1985)). Thus, it is within the scope of the present invention to utilize as a linker a peptide sequence that is cleaved by urokinase.

The invention also provides the use of peptide sequences that are sensitive to cleavage by tryptases. Human mast cells express at least four distinct tryptases, designated α , β I, β II, and β III. These enzymes are not controlled by blood plasma proteinase inhibitors and only cleave a few physiological substrates *in vitro*. The tryptase family of serine proteases has been implicated in a variety of allergic and inflammatory diseases involving mast cells because of elevated tryptase levels found in biological fluids from patients with these disorders. However, the exact role of tryptase in the pathophysiology of disease remains to be delineated. The scope of biological functions and corresponding physiological consequences of tryptase are substantially defined by their substrate specificity.

Tryptase is a potent activator of pro-urokinase plasminogen activator (uPA), the zymogen form of a protease associated with tumor metastasis and invasion. Activation of the plasminogen cascade, resulting in the destruction of extracellular matrix for cellular extravasation and migration, may be a function of tryptase activation of pro-urokinase plasminogen activator at the P4-P1 sequence of Pro-Arg-Phe-Lys (SEQ ID NO: 4) (Stack, *et al.*, *Journal of Biological Chemistry* **269** (13): 9416-9419 (1994)). Vasoactive intestinal peptide, a neuropeptide that is implicated in the regulation of vascular permeability, is also cleaved by tryptase, primarily at the Thr-Arg-Leu-Arg (SEQ ID NO: 5) sequence (Tam, *et al.*, *Am. J. Respir. Cell Mol. Biol.* **3**: 27-32 (1990)). The G-protein coupled receptor PAR-2 can be cleaved and activated by tryptase at the Ser-Lys-Gly-Arg (SEQ ID NO: 6) sequence to drive fibroblast proliferation, whereas the thrombin activated receptor PAR-1 is inactivated by tryptase at the Pro-Asn-Asp-Lys (SEQ ID NO: 7) sequence (Molino *et al.*, *Journal of Biological Chemistry* **272**(7): 4043-4049 (1997)). Taken together, this evidence suggests a central role for tryptase in tissue remodeling as a consequence of disease. This is consistent with the profound changes observed in several mast cell-mediated disorders. One hallmark of chronic asthma and other long-term respiratory diseases is fibrosis and thickening of the underlying tissues that could be the result of tryptase activation of its physiological targets. Similarly, a series of reports have shown angiogenesis to be associated with mast cell density, tryptase activity and poor prognosis in a variety of cancers (Coussens *et al.*, *Genes and Development* **13**(11): 1382-97 (1999)); Takanami *et al.*, *Cancer* **88**(12): 2686-92 (2000);

Toth-Jakatics *et al.*, *Human Pathology* **31**(8): 955-960 (2000); Ribatti *et al.*, *International Journal of Cancer* **85**(2): 171-5 (2000)).

Methods are known in the art for evaluating whether a particular protease cleaves a selected peptide sequence. For example, the use of 7-amino-4-methyl coumarin (AMC) fluorogenic peptide substrates is a well-established method for the determination of protease specificity (Zimmerman, M., *et al.*, (1977) *Analytical Biochemistry* **78**:47-51). Specific cleavage of the anilide bond liberates the fluorogenic AMC leaving group allowing for the simple determination of cleavage rates for individual substrates. More recently, arrays (Lee, D., *et al.*, (1999) *Bioorganic and Medicinal Chemistry Letters* **9**:1667-72) and positional-scanning libraries (Rano, T.A., *et al.*, (1997) *Chemistry and Biology* **4**:149-55) of AMC peptide substrate libraries have been employed to rapidly profile the N-terminal specificity of proteases by sampling a wide range of substrates in a single experiment. Thus, one of skill in the art may readily evaluate an array of peptide sequences to determine their utility in the present invention without resort to undue experimentation.

15

(2) Hydrazine Linkers (H)

In a second embodiment, the conjugate of the invention comprises a hydrazine self-immolative linker, wherein the conjugate has the structure:

20

wherein D, L¹, L⁴, and X⁴ are as defined above and described further herein, and H is a linker comprising the structure:

25

wherein

n_1 is an integer from 1 – 10;

n_2 is 0, 1, or 2;

each R^{24} is a member independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted

5 heteroalkyl; and

I is either a bond (*i.e.*, the bond between the carbon of the backbone and the adjacent nitrogen) or:

10

wherein n_3 is 0 or 1, with the proviso that when n_3 is 0, n_2 is not 0; and n_4 is 1, 2, or 3,

wherein when I is a bond, n_1 is 3 and n_2 is 1, D can not be

where R is Me or $\text{CH}_2\text{-CH}_2\text{-NMe}_2$.

15

In one embodiment, the substitution on the phenyl ring is a para substitution. In preferred embodiments, n_1 is 2, 3, or 4 or n_1 is 3. In preferred embodiments, n_2 is 1. In preferred embodiments, I is a bond (*i.e.*, the bond between the carbon of the backbone and the adjacent nitrogen). In one aspect, the hydrazine linker, H, can form a 6-membered self

20

immolative linker upon cleavage, for example, when n_3 is 0 and n_4 is 2. In another aspect, the hydrazine linker, H, can form two 5-membered self immolative linkers upon cleavage. In yet other aspects, H forms a 5-membered self immolative linker, H forms a 7-membered self immolative linker, or H forms a 5-membered self immolative linker and a 6-membered self immolative linker, upon cleavage. The rate of cleavage is affected by the size of the ring

formed upon cleavage. Thus, depending upon the rate of cleavage desired, an appropriate size ring to be formed upon cleavage can be selected.

Five Membered Hydrazine Linkers

5 In one embodiment, the hydrazine linker comprises a 5-membered hydrazine linker, wherein H comprises the structure:

10 In a preferred embodiment, n_1 is 2, 3, or 4. In another preferred embodiment, n_1 is 3. In the above structure, each R^{24} is a member independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted heteroalkyl. In one embodiment, each R^{24} is independently H or a $C_1 - C_6$ alkyl. In another embodiment, each R^{24} is independently H or a $C_1 - C_3$ alkyl, more preferably H or CH_3 . In another embodiment, at least one R^{24} is a methyl group. In another
15 embodiment, each R^{24} is H. Each R^{24} is selected to tailor the compounds steric effects and for altering solubility.

20 The 5-membered hydrazine linkers can undergo one or more cyclization reactions that separate the drug from the linker, and can be described, for example, by:

An exemplary synthetic route for preparing a five membered linker of the invention

is:

5

The Cbz-protected DMDA **b** is reacted with 2,2-Dimethyl-malonic acid **a** in solution with thionyl chloride to form a Cbz-DMDA-2,2-dimethylmalonic acid **c**. Compound **c** is reacted with Boc-N-methyl hydrazine **d** in the presence of hydrogen to form DMDA-2,2-dimethylmalonic-Boc-N-methylhydrazine **e**.

Six Membered Hydrazine Linkers

In another embodiment, the hydrazine linker comprises a 6-membered hydrazine linker, wherein H comprises the structure:

5

In a preferred embodiment, n_1 is 3. In the above structure, each R^{24} is a member independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted heteroalkyl. In one embodiment, each R^{24} is independently H or a $C_1 - C_6$ alkyl. In another embodiment, each R^{24} is independently H or a $C_1 - C_3$ alkyl, more preferably H or CH_3 . In another embodiment, at least one R^{24} is a methyl group. In another embodiment, each R^{24} is H. Each R^{24} is selected to tailor the compounds steric effects and for altering solubility. In a preferred embodiment, H comprises the structure:

15

In one embodiment, H comprises a geminal dimethyl substitution. In one embodiment of the above structure, each R^{24} independently an H or a substituted or unsubstituted alkyl.

20

The 6-membered hydrazine linkers will undergo a cyclization reaction that separates the drug from the linker, and can be described as:

An exemplary synthetic route for preparing a six membered linker of the invention is:

The Cbz-protected dimethyl alanine **a** in solution with dichloromethane, was reacted with HOAt, and CPI to form a Cbz-protected dimethylalanine hydrazine **b**. The hydrazine **b** is deprotected by the action of methanol, forming compound **c**.

Other Hydrazine Linkers

It is contemplated that the invention comprises a linker having seven members. This linker would likely not cyclize as quickly as the five or six membered linkers, but this may be preferred for some drug-ligand conjugates. Similarly, the hydrazine linker may comprise two six membered rings or a hydrazine linker having one six and one five membered cyclization products. A five and seven membered linker as well as a six and seven membered linker are also contemplated.

Another hydrazine structure, H, has the formula:

where q is 0, 1, 2, 3, 4, 5, or 6; and

each R^{24} is a member independently selected from the group consisting

of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted

5 heteroalkyl. This hydrazine structure can also form five-, six-, or seven-membered rings and additional components can be added to form multiple rings.

(3) Disulfide Linkers (J)

10 In yet another embodiment, the linker comprises an enzymatically cleavable disulfide group. In one embodiment, the invention provides a cytotoxic drug-ligand compound having a structure according to Formula 3:

15

wherein D , L^1 , L^4 , and X^4 are as defined above and described further herein, and J is a disulfide linker comprising a group having the structure:

20

wherein

each R²⁴ is a member independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, and unsubstituted heteroalkyl;

5 each K is a member independently selected from the group consisting of substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl, unsubstituted heterocycloalkyl, halogen, NO₂, NR²¹R²², NR²¹COR²², OCONR²¹R²², OCOR²¹, and OR²¹

10 wherein

R²¹ and R²² are independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl and unsubstituted heterocycloalkyl;

15 a is an integer of 0, 1, 2, 3, or 4; and

d is an integer of 0, 1, 2, 3, 4, 5, or 6.

The aromatic ring of the disulfides linker may be substituted with one or more "K" groups. A "K" group is a substituent on the aromatic ring that replaces a hydrogen otherwise attached to one of the four non-substituted carbons that are part of the ring structure. The "K" group may be a single atom, such as a halogen, or may be a multi-atom group, such as alkyl, heteroalkyl, amino, nitro, hydroxy, alkoxy, haloalkyl, and cyano. Exemplary K substituents independently include, but are not limited to, F, Cl, Br, I, NO₂, OH, OCH₃, NHCOCH₃, N(CH₃)₂, NHCOCF₃ and methyl. For "Ka", a is an integer of 0, 1, 2, 3, or 4. In a specific embodiment, a is 0.

25 In a preferred embodiment, the linker comprises an enzymatically cleavable disulfide group of the following formula:

In this embodiment, the identities of L^4 , X^4 , p , and R^{24} are as described above, and d is 0, 1, 2, 3, 4, 5, or 6. In a particular embodiment, d is 1 or 2.

A more specific disulfide linker is shown in the formula below:

5

A specific example of this embodiment is as follows:

10

Preferably, d is 1 or 2.

Another disulfide linker is shown in the formula below:

A specific example of this embodiment is as follows:

5

Preferably, d is 1 or 2.

In various embodiments, the disulfides are ortho to the amine. In another specific embodiment, a is 0. In preferred embodiments, R^{24} is independently selected from H and CH_3 .

10

An exemplary synthetic route for preparing a disulfide linker of the invention is as follows:

5 A solution of 3-mercaptopropionic acid **a** is reacted with aldrithiol-2 to form
 3-methylbenzothiazolium iodide **b**. 3-methylbenzothiazolium iodide **c** is reacted with
 sodium hydroxide to form compound **d**. A solution of compound **d** with methanol is further
 reacted with compound **b** to form compound **e**. Compound **e** deprotected by the action of
 acetyl chloride and methanol forming compound **f**.

10

The drug-ligand conjugate of the current invention may optionally contain two
 or more linkers. These linkers may be the same or different. For example, a peptidyl linker
 may be used to connect the drug to the ligand and a second peptidyl linker may attach a
 diagnostic agent to the complex. Alternatively, any of a peptidyl, hydrazine, or disulfide linker
 15 may connect the drug and ligand complex and any of a peptidyl, hydrazine, or disulfide
 linker may attach a diagnostic agent to the complex. Other uses for additional linkers include
 linking analytical agents, biomolecules, targeting agents, and detectable labels to the drug-
 ligand complex.

Also within the scope of the present invention are compounds of the invention that are poly- or multi-valent species, including, for example, species such as dimers, trimers, tetramers and higher homologs of the compounds of the invention or reactive analogues thereof. The poly- and multi-valent species can be assembled from a single species or more than one species of the invention. For example, a dimeric construct can be “homo-dimeric” or “heterodimeric.” Moreover, poly- and multi-valent constructs in which a compound of the invention or a reactive analogue thereof, is attached to an oligomeric or polymeric framework (*e.g.*, polylysine, dextran, hydroxyethyl starch and the like) are within the scope of the present invention. The framework is preferably polyfunctional (*i.e.* having an array of reactive sites for attaching compounds of the invention). Moreover, the framework can be derivatized with a single species of the invention or more than one species of the invention.

Moreover, the present invention includes compounds that are functionalized to afford compounds having water-solubility that is enhanced relative to analogous compounds that are not similarly functionalized. Thus, any of the substituents set forth herein can be replaced with analogous radicals that have enhanced water solubility. For example, it is within the scope of the invention to, for example, replace a hydroxyl group with a diol, or an amine with a quaternary amine, hydroxy amine or similar more water-soluble moiety. In a preferred embodiment, additional water solubility is imparted by substitution at a site not essential for the activity towards the ion channel of the compounds set forth herein with a moiety that enhances the water solubility of the parent compounds. Methods of enhancing the water-solubility of organic compounds are known in the art. Such methods include, but are not limited to, functionalizing an organic nucleus with a permanently charged moiety, *e.g.*, quaternary ammonium, or a group that is charged at a physiologically relevant pH, *e.g.* carboxylic acid, amine. Other methods include, appending to the organic nucleus hydroxyl- or amine-containing groups, *e.g.* alcohols, polyols, polyethers, and the like. Representative examples include, but are not limited to, polylysine, polyethyleneimine, poly(ethyleneglycol) and poly(propyleneglycol). Suitable functionalization chemistries and strategies for these compounds are known in the art. *See*, for example, Dunn, R.L., *et al.*, Eds. POLYMERIC DRUGS AND DRUG DELIVERY SYSTEMS, ACS Symposium Series Vol. 469, American Chemical Society, Washington, D.C. 1991.

DRUGS

Drugs, depicted as "D" herein, are provided in the current invention as part of a drug-ligand conjugate where the drug is linked to a ligand through either a peptidyl, hydrazine, or disulfide linker. The drug must possess a desired biological activity and contain a reactive functional group in order to link to the ligand. The desired biological activity includes the diagnosis, cure, mitigation, treatment, or prevention of disease in an animal such as a human. Thus, so long as it has the needed reactive functional group, the term "drug" refers to chemicals recognized as drugs in the official United States Pharmacopeia, official Homeopathic Pharmacopeia of the United States, or official National Formulary, or any supplement thereof Exemplary drugs are set forth in the Physician's Desk Reference (PDR) and in the Orange Book maintained by the U.S. Food and Drug Administration (FDA). New drugs are being continually being discovered and developed, and the present invention provides that these new drugs may also be incorporated into the drug-ligand complex of the current invention.

Preferred functional groups include primary or secondary amines, hydroxyls, sulfhydryls, carboxyls, aldehydes, and ketones. More preferred functional groups include hydroxyls, primary or secondary amines, sulfhydryls and carboxylic acid functional groups. Even more preferred functional groups include hydroxyls, primary and secondary amines and carboxylic acid functional groups. The drug must have at least one, but may have 2, 3, 4, 5, 6 or more reactive functional groups. Additionally, a self-immolative spacer, L¹, may be incorporated between the reactive functional group of the drug and the peptide, hydrazine or disulfide linker.

The drug-ligand conjugate is effective for the usual purposes for which the corresponding drugs are effective, but have superior efficacy because of the ability, inherent in the ligand, to transport the drug to the desired cell where it is of particular benefit.

Exemplary drugs include proteins, peptides, and small molecule drugs containing a functional group for linkage to the ligand. More specifically, these drugs include, for example, the enzyme inhibitors such as dihydrofolate reductase inhibitors, and thymidylate synthase inhibitors, DNA intercalators, DNA cleavers, topoisomerase inhibitors, the anthracycline family of drugs, the vinca drugs, the mitomycins, the bleomycins, the

cytotoxic nucleosides, the pteridine family of drugs, diylenes, the podophyllotoxins, differentiation inducers, and taxols.

Preferred drugs of the current invention include cytotoxic drugs useful in cancer therapy and other small molecules, proteins or polypeptides with desired biological activity, such as a toxin. The drug may be selected to be activated at a tumor cells by conjugation to a tumor-specific ligand. These tumor specific drug-ligand conjugates have tumor specificity arising from the specificity of the ligand. Examples of this are drug-ligand conjugates that are highly selective substrates for tumor specific enzymes, where these enzymes are present in the proximity of the tumor in sufficient amounts to generate cytotoxic levels of free drug in the vicinity of the tumor. One advantage of these tumor-specific drug-ligand complexes is that they are stable to adventitious proteases in the human serum. Another advantage of the drug-ligand complex is that they are less toxic than the corresponding free drug; additionally, the specificity of the complex may allow for lower overall concentrations to be used relative to the free drug since the increased specificity will result in a higher percentage of the complex to be present at the tumor site.

Cytotoxins

Cytotoxic drugs useful in the current invention include, for example, duocarmycins and CC-1065, and analogues thereof, including CBI (1,2,9,9a-tetrahydrocyclopropa[c]benz[e]indol-4-one)-based analogues, MCBI (7-methoxy-1,2,9,9a-tetrahydrocyclopropa[c]benz[e]indol-4-one)-based analogues and CCBI (7-cyano-1,2,9,9a-tetrahydrocyclo-propa[c]benz[e]-indol-4-one)-based analogues of the duocarmycins and CC-1065, doxorubicin and doxorubicin conjugates such as morpholino-doxorubicin and cyanomorpholino-doxorubicin, dolastatins such as dolestatin-10, combretastatin, calicheamicin, maytansine, maytansine analogs, DM-1, auristatin E, auristatin EB (AEB), auristatin EFP (AEFP), monomethyl auristatin E (MMAE), 5-benzoylvaleric acid-AE ester (AEVB), tubulysins, disorazole, epothilones, Paclitaxel, docetaxel, SN-38, Topotecan, rhizoxin, echinomycin, colchicine, vinblastin, vindesine, estramustine, cemadotin, eleutherobin, methotrexate, methopterin, dichloromethotrexate, 5-fluorouracil, 6-mercaptapurine, cytosine arabinoside, melphalan, leurosine, leurosideine, actinomycin, daunorubicin and daunorubicin conjugates, mitomycin C, mitomycin A, carminomycin,

aminopterin, tallysomyin, podophyllotoxin and podophyllotoxin derivatives such as etoposide or etoposide phosphate, vincristine, taxol, taxotere retinoic acid, butyric acid, N⁸-acetyl spermidine, camptothecin, and their analogues. Other known drugs may be modified in order to provide a functional group for conjugation to the linker described herein. Such chemical modification is known in the art.

Preferred cytotoxins for use in the current invention include: duocarmycins and CC-1065, and CCBI-based and MCBI-based analogues thereof, morpholino-doxorubicin, cyanomorpholino-doxorubicin, dolastatin-10, combretastatin, calicheamicin, maytansine, DM-1, auristatin E, AEB, AAFP, MMAE, Tubulysin A, Disorazole, epothilone A and epothilone B.

Particularly preferred cytotoxins of the present invention are active, potent duocarmycin derivatives and CC-1065. The parent agents are exceptionally potent antitumor antibiotics that derive their biological effects through the reversible, stereoelectronically controlled sequence selective alkylation of DNA (Boger *et al.* *J. Org. Chem.* **55**: 4499 (1990); Boger *et al.* *J. Am. Chem. Soc.* **112**: 8961 (1990); Boger *et al.*, *J. Am. Chem. Soc.* **113**: 6645 (1991); Boger *et al.* *J. Am. Chem. Soc.* **115**: 9872 (1993); Boger *et al.*, *Bioorg. Med. Chem. Lett.* **2**: 759 (1992)). Subsequent to the initial disclosure of the duocarmycins, extensive efforts have been devoted to elucidating the DNA alkylation selectivity of the duocarmycins and its structural origin.

A particularly preferred aspect of the current invention provides a cytotoxic compound having a structure according to Formula 7:

(7)

in which ring system A is a member selected from substituted or unsubstituted aryl substituted or unsubstituted heteroaryl and substituted or unsubstituted heterocycloalkyl groups. Exemplary ring systems include phenyl and pyrrole.

The symbols E and G are independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, a heteroatom, a single bond or E and G are optionally joined to form a ring system selected from substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl and substituted or unsubstituted heterocycloalkyl.

The symbol X represents a member selected from O, S and NR^{23} . R^{23} is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl.

The symbol R^3 represents a member selected from $(=\text{O})$, SR^{11} , NHR^{11} and OR^{11} , in which R^{11} is H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, diphosphates, triphosphates, acyl, $\text{C}(\text{O})\text{R}^{12}\text{R}^{13}$, $\text{C}(\text{O})\text{OR}^{12}$, $\text{C}(\text{O})\text{NR}^{12}\text{R}^{13}$, $\text{P}(\text{O})(\text{OR}^{12})_2$, $\text{C}(\text{O})\text{CHR}^{12}\text{R}^{13}$, SR^{12} or $\text{SiR}^{12}\text{R}^{13}\text{R}^{14}$. The symbols R^{12} , R^{13} , and R^{14} independently represent H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl and substituted or unsubstituted aryl, wherein R^{12} and R^{13} together with the nitrogen or carbon atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more heteroatoms. One or more of R^{12} , R^{13} , or R^{14} can include a cleaveable group within its structure.

R^4 , R^4' , R^5 and R^5' are members independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, substituted or unsubstituted heterocycloalkyl, halogen, NO_2 , $\text{NR}^{15}\text{R}^{16}$, $\text{NC}(\text{O})\text{R}^{15}$, $\text{OC}(\text{O})\text{NR}^{15}\text{R}^{16}$, $\text{OC}(\text{O})\text{OR}^{15}$, $\text{C}(\text{O})\text{R}^{15}$, SR^{15} , OR^{15} , $\text{CR}^{15}=\text{NR}^{16}$, and $\text{O}(\text{CH}_2)_n\text{N}(\text{CH}_3)_2$, wherein n is an integer from 1 to 20. R^{15} and R^{16} independently represent H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, substituted or unsubstituted heterocycloalkyl and substituted or unsubstituted peptidyl, wherein R^{15} and R^{16} together with the nitrogen atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more heteroatoms. One exemplarily structure is aniline.

$R^4, R^{4'}, R^5, R^{5'}, R^{11}, R^{12}, R^{13}, R^{15}$ and R^{16} optionally contain one or more cleaveable groups within their structure. Exemplary cleaveable groups include, but are not limited to peptides, amino acids, hydrazines, and disulfides.

At least one of $R^{11}, R^{12}, R^{13}, R^{15}$ and R^{16} is used to join the drug to a linker of the present invention, as described herein, for example to L^1 , if present or to F, H, or J.

In a still further exemplary embodiment, at least one of $R^4, R^{4'}, R^5, R^{5'}, R^{11}, R^{12}, R^{13}, R^{15}$ and R^{16} bears a reactive group appropriate for conjugating the compound. In a further exemplary embodiment, $R^4, R^{4'}, R^5, R^{5'}, R^{11}, R^{12}, R^{13}, R^{15}$ and R^{16} are independently selected from H, substituted alkyl and substituted heteroalkyl and have a reactive functional group at the free terminus of the alkyl or heteroalkyl moiety. One or more of $R^4, R^{4'}, R^5, R^{5'}, R^{11}, R^{12}, R^{13}, R^{15}$ and R^{16} may be conjugated to another species, *e.g.*, targeting agent, detectable label, solid support, etc.

As will be apparent from the discussion herein, when at least one of R^{15} and R^{16} comprises a reactive functional group, that group can be a component of a bond between the drug and another molecule. In an exemplary embodiment in which at least one of R^{15} and R^{16} comprises a linkage between the drug and another species, at least one of R^{15} and R^{16} is a moiety that is cleaved by an enzyme.

In a further exemplary embodiment, at least one of $R^4, R^{4'}, R^5$ and $R^{5'}$ is:

(8).

In Formula 8, the symbols X^2 and Z^1 represent members independently selected from O, S and NR^{23} . The groups R^{17} and R^{18} are independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, substituted or unsubstituted heterocycloalkyl, halogen, NO_2 , $NR^{19}R^{20}$, $NC(O)R^{19}$, $OC(O)NR^{19}$, $OC(O)OR^{19}$, $C(O)R^{19}$, SR^{19} or OR^{19} , with the proviso that at least one one of R^{12}, R^{13}, R^{19} , or R^{20} comprises a linker of the present invention, as disclosed herein.

The symbols R^{19} and R^{20} independently represent substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, substituted or

unsubstituted heteroaryl, substituted or unsubstituted heterocycloalkyl, substituted or unsubstituted peptidyl, wherein R¹⁹ and R²⁰ together with the nitrogen atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more heteroatoms, with the proviso that when Z¹ is NH, both R¹⁷ and R¹⁸ are not H, and R¹⁷ is not NH₂. Throughout the present specification, the symbols R¹⁹ and R²⁰ also encompass the groups set forth for R⁴ and R⁵. Thus, for example, it is within the scope of the present invention to provide compounds having two or more of the fused phenyl-heterocyclic ring systems set forth immediately above linked in series, or a fused ring in combination with a linker. Moreover, in those embodiments in which a linker is present, the linker may be present as an R⁴, R^{4'}, R⁵, or R^{5'} substituent or as an R¹⁷ or R¹⁸ substituent.

R⁶ is a single bond which is either present or absent. When R⁶ is present, R⁶ and R⁷ are joined to form a cyclopropyl ring. R⁷ is CH₂-X¹ or -CH₂-. When R⁷ is -CH₂- it is a component of the cyclopropane ring. The symbol X¹ represents a leaving group such as a halogen, for example Cl, Br or F. The combinations of R⁶ and R⁷ are interpreted in a manner that does not violate the principles of chemical valence.

The curved line within the six-membered ring indicates that the ring may have one or more degree of unsaturation, and it may be aromatic. Thus, ring structures such as those set forth below, and related structures, are within the scope of Formula (9):

In an exemplary embodiment, ring system A is a substituted or unsubstituted phenyl ring. Ring system A is preferably substituted with one or more aryl group substituents as set forth in the definitions section herein. In one preferred embodiment, the phenyl ring is substituted with a CN or methoxy moiety.

In another exemplary embodiment, the invention provides a compound having a structure according to Formula 10:

(10).

In this embodiment, the identities of the radicals R^3 , R^4 , $R^{4'}$, R^5 , $R^{5'}$, R^6 , R^7 and X are substantially as described above. The symbol Z is a member independently selected from O, S and NR^{23} . The symbol R^{23} represents a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl. Each R^{23} is

5 independently selected. The symbol R^1 represents H, substituted or unsubstituted lower alkyl, or $C(O)R^8$ or CO_2R^8 . R^8 is a member selected from substituted alkyl, unsubstituted alkyl, NR^9R^{10} , NR^9NHR^{10} and OR^9 . R^9 , and R^{10} are independently selected from H, substituted or unsubstituted alkyl and substituted or unsubstituted heteroalkyl. The radical R^2

10 is H, or substituted or unsubstituted lower alkyl. It is generally preferred that when R^2 is substituted alkyl, it is other than a perfluoroalkyl, e.g., CF_3 . In one embodiment, R^2 is a substituted alkyl wherein the substitution is not a halogen. In another embodiment, R^2 is an unsubstituted alkyl.

As discussed above, X^1 may be a leaving group. Useful leaving groups

15 include, but are not limited to, halogens, azides, sulfonic esters (e.g., alkylsulfonyl, arylsulfonyl), oxonium ions, alkyl perchlorates, ammonioalkanesulfonate esters, alkylfluorosulfonates and fluorinated compounds (e.g., triflates, nonaflates, tresylates) and the like. Particular halogens useful as leaving groups are F, Cl and Br. The choice of these and other leaving groups appropriate for a particular set of reaction conditions is within the

20 abilities of those of skill in the art (*see*, for example, March J, ADVANCED ORGANIC CHEMISTRY, 2nd Edition, John Wiley and Sons, 1992; Sandler SR, Karo W, ORGANIC FUNCTIONAL GROUP PREPARATIONS, 2nd Edition, Academic Press, Inc., 1983; and Wade LG, COMPENDIUM OF ORGANIC SYNTHETIC METHODS, John Wiley and Sons, 1980).

In an exemplary embodiment R^1 is an ester moiety, such as CO_2CH_3 . In a further exemplary embodiment, R^2 is a lower alkyl group, which may be substituted or unsubstituted. A presently preferred lower alkyl group is CH_3 . In a still further embodiment, R^1 is CO_2CH_3 , and R^2 is CH_3 .

5 In yet another exemplary embodiment, R^4 , $R^{4'}$, R^5 , and $R^{5'}$ are members independently selected from H, halogen, NH_2 , OMe, $\text{O}(\text{CH}_2)_2\text{N}(\text{Me})_2$ and NO_2 .

In one embodiment, the drug is selected such that the leaving group X^1 is a member selected from the group consisting of halogen, alkylsulfonyl, arylsulfonyl, and azide. In another embodiment, Z is O. In certain embodiments, R^1 may be CO_2CH_3 or R^2 may be CH_3 ; additionally, R^1 may be CO_2CH_3 , and R^2 may be CH_3 . One of R^4 , $R^{4'}$, R^5 or $R^{5'}$ may be $\text{C}(\text{O})\text{R}^{15}$ and the other three of R^4 , $R^{4'}$, R^5 and $R^{5'}$ are H. Additionally, at least one of R^4 , $R^{4'}$, R^5 and $R^{5'}$ may be other than a member selected from H and OCH_3 . In one embodiment, R^4 , $R^{4'}$, R^5 and $R^{5'}$ are members independently selected from H, halogen, NH_2 , $\text{O}(\text{CH}_2)_2\text{N}(\text{Me})_2$ and NO_2 .

15 In a preferred embodiment, one of R^4 , $R^{4'}$, R^5 or $R^{5'}$ is $\text{O}(\text{CH}_2)_2\text{N}(\text{Me})_2$ and the others of R^4 , $R^{4'}$, R^5 and $R^{5'}$ are H. In another embodiment, R^7 is $\text{CH}_2\text{-X}^1$ where X^1 is F, Cl or Br and R^6 is absent.

In yet another exemplary embodiment, the invention provides compounds having a structure according to Formula 11 and 12:

(11)

and

(12)

20 In one embodiment of the Formula above, X is preferably O; and Z is preferably O. In another embodiment, Z is NR^{23} or O. Alternatively, one of R^4 , $R^{4'}$, R^5 or $R^{5'}$ may be $\text{O}(\text{CH}_2)_2\text{N}(\text{Me})_2$ while the other three of R^4 , $R^{4'}$, R^5 or $R^{5'}$ are H. In one

embodiment, R^4 , $R^{4'}$, R^5 or $R^{5'}$ may be selected from the group consisting of R^{29} , COOR^{29} , C(O)NR^{29} , and C(O)NNR^{29} , wherein R^{29} is selected from the group consisting of H, OH, substituted alkyl, unsubstituted alkyl, substituted cycloalkyl, unsubstituted cycloalkyl, substituted heteroalkyl, unsubstituted heteroalkyl, substituted cycloheteroalkyl, unsubstituted cycloheteroalkyl, substituted heteroaryl, and unsubstituted heteroaryl.

In another embodiment of the Formula above X is preferably O, Z is preferably O, R_1 is preferably CO_2CH_3 , R_7 is preferably $\text{CH}_2\text{-Cl}$, R_2 is preferably CH_3 , R_3 is preferably OH. Alternatively, one of R^4 , $R^{4'}$, R^5 or $R^{5'}$ may be $\text{NHC(O)(C}_6\text{H}_4\text{)NH}_2$ while the other three of R^4 , $R^{4'}$, R^5 or $R^{5'}$ are H.

In one embodiment, R^{29} may be selected from the group consisting of:

In yet another embodiment of the drug, one member selected from R^4 and R^5 is:

wherein X^2 and Z^1 are members independently selected from O, S and NR^{23} ; R^{17} and R^{18} are members independently selected from the group consisting of H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, substituted or unsubstituted heterocycloalkyl, halogen, NO_2 , $\text{NR}^{19}\text{R}^{20}$, NC(O)R^{19} , OC(O)NR^{19} , OC(O)OR^{19} , C(O)R^{19} , OR^{19} , and $\text{O(CH}_2\text{)}_n\text{N(CH}_3\text{)}_2$. In this embodiment, n is an integer from 1 to 20; R^{19} and R^{20} are independently selected from substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, and substituted or unsubstituted heterocycloalkyl, wherein R^{19} and R^{20} together with the nitrogen atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring

system having from 4 to 6 members, optionally containing two or more heteroatoms, wherein one of R^{11} , R^{12} , R^{13} , R^{15} , R^{16} , R^{19} , or R^{20} links said drug to L^1 , if present, or to F. In one preferred embodiment, X^2 is O and Z^1 is O or NR^{23} .

Another preferred structure of the duocarmycin analog of Formula 7 is a structure in which the ring system A is an unsubstituted or substituted phenyl ring. The preferred substituents on the drug molecule described hereinabove for the structure of Formula 7 when the ring system A is a pyrrole are also preferred substituents when the ring system A is an unsubstituted or substituted phenyl ring.

For example, in a preferred embodiment, the drug (D) comprises a structure:

10

In this structure, R^3 , R^6 , R^7 , X are as described above for Formula 7.

Furthermore, Z is a member selected from O, S and NR^{23} , wherein R^{23} is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl;

R^1 is H, substituted or unsubstituted lower alkyl, $C(O)R^8$, or CO_2R^8 , wherein R^8 is a member selected from NR^9R^{10} and OR^9 , in which R^9 and R^{10} are members independently selected from H, substituted or unsubstituted alkyl and substituted or unsubstituted heteroalkyl;

$R^{1'}$ is H, substituted or unsubstituted lower alkyl, or $C(O)R^8$, wherein R^8 is a member selected from NR^9R^{10} and OR^9 , in which R^9 and R^{10} are members independently selected from H, substituted or unsubstituted alkyl and substituted or unsubstituted heteroalkyl;

R^2 is H, or substituted or unsubstituted lower alkyl or unsubstituted heteroalkyl or cyano or alkoxy; and $R^{2'}$ is H, or substituted or unsubstituted lower alkyl or unsubstituted heteroalkyl.

At least one of R¹¹, R¹², R¹³, R¹⁵ or R¹⁶ links the drug to L¹, if present, or to F, H, or J.

In a preferred embodiment, one of R⁴, R^{4'}, R⁵ or R^{5'} is O(CH₂)₂N(Me)₂ and the others of R⁴, R^{4'}, R⁵ and R^{5'} are H. In another embodiment, R⁷ is CH₂-X¹ where X¹ is F, Cl or Br and R⁶ is absent.

In one embodiment, the invention provides a cytotoxic drug-ligand compound having a structure according to the following formula:

wherein the symbol L¹ represents a self-immolative spacer where m is an integer of 0, 1, 2, 3, 4, 5, or 6.

The symbol X⁴ represents a member selected from the group consisting of protected reactive functional groups, unprotected reactive functional groups, detectable labels, and targeting agents.

The symbol L⁴ represents a linker member, and p is 0 or 1. L⁴ is a moiety that imparts increased solubility or decreased aggregation properties to the conjugates. Examples of L⁴ moieties include substituted alkyl, unsubstituted alkyl, substituted aryl, unsubstituted aryl, substituted heteroalkyl, or unsubstituted heteroalkyl, any of which may be straight, branched, or cyclic, a positively or negatively charged amino acid polymer, such as polylysine or polyarginine, or other polymers such as polyethylene glycol.

The symbol Q represent any cleavable linker including, but not limited to, any of the peptidyl, hydrozone, and disulfide linkers described herein. Other suitable linkers include, but are not limited to, those described in U.S. Patent No. 6,214,345; U.S. Patent Applications Publication Nos. 2003/0096743, 2003/0130189, and 2004/121940; PCT Patent Applications Publication Nos. WO 03/026577 and WO 04/043493; and European Patent Applications Publication Nos. EP1243276 and EP1370298, all of which are incorporated herein by reference. Cleavable linkers include those that can be selectively cleaved by a chemical or biological process and upon cleavage separate the drug, D¹, from X⁴. Cleavage can occur anywhere along the length of the linker or at either terminus of the linker.

The symbol D¹ represents a drug having the following formula:

wherein X and Z are members independently selected from O, S and

NR²³;

5

R²³ is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl;

R¹ is H, substituted or unsubstituted lower alkyl, C(O)R⁸, or CO₂R⁸,

R^{1'} is H, substituted or unsubstituted lower alkyl, or C(O)R⁸,

wherein R⁸ is a member selected from NR⁹R¹⁰ and OR⁹ and R⁹ and R¹⁰

10

are members independently selected from H, substituted or unsubstituted alkyl and substituted or unsubstituted heteroalkyl;

R² is H, or substituted or unsubstituted lower alkyl or unsubstituted heteroalkyl or cyano or alkoxy;

R^{2'} is H, or substituted or unsubstituted lower alkyl or unsubstituted

15

heteroalkyl,

R³ is a member selected from the group consisting of SR¹¹, NHR¹¹ and OR¹¹, wherein R¹¹ is a member selected from the group consisting of H, substituted alkyl,

unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, diphosphates, triphosphates, acyl, C(O)R¹²R¹³, C(O)OR¹², C(O)NR¹²R¹³, P(O)(OR¹²)₂, C(O)CHR¹²R¹³,

20

SR¹² and SiR¹²R¹³R¹⁴, in which R¹², R¹³, and R¹⁴ are members independently selected from

H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl and substituted or unsubstituted aryl, wherein R¹² and R¹³ together with the nitrogen or carbon atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more heteroatoms;

wherein at least one of R^{11} , R^{12} , and R^{13} links said drug to L^1 , if present, or to Q,

R^6 is a single bond which is either present or absent and when present R^6 and R^7 are joined to form a cyclopropyl ring; and

5 R^7 is CH_2-X^1 or $-CH_2-$ joined in said cyclopropyl ring with R^6 ,

wherein

X^1 is a leaving group,

10 R^4 , $R^{4'}$, R^5 and $R^{5'}$ are members independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl, unsubstituted heterocycloalkyl, halogen, NO_2 , $NR^{15}R^{16}$, $NC(O)R^{15}$, $OC(O)NR^{15}R^{16}$, $OC(O)OR^{15}$, $C(O)R^{15}$, SR^{15} , OR^{15} , $CR^{15}=NR^{16}$, and $O(CH_2)_nNR^{24}R^{25}$ wherein n is an integer from 1 to 20;

15 R^{15} and R^{16} are independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, substituted or unsubstituted heterocycloalkyl, and substituted or unsubstituted peptidyl, wherein R^{15} and R^{16} together with the nitrogen atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more
20 heteroatoms;

and R^{24} and R^{25} are independently selected from unsubstituted alkyl,

and

wherein at least one of R^4 , $R^{4'}$, R^5 and $R^{5'}$ is $O(CH_2)_nNR^{24}R^{25}$.

In some embodiments, n is 2. In some embodiments, R^{24} and R^{25} are methyl.

25 In some embodiments, R^4 is $O(CH_2)_nNR^{24}R^{25}$ and $R^{4'}$, R^5 and $R^{5'}$ are H. In some embodiments, R^4 is $O(CH_2)_2N(CH_3)_2$ and $R^{4'}$, R^5 and $R^{5'}$ are H. In some embodiment, Q is a linker selected from F, H, and J, as described above. In some embodiments, R^1 , $R^{1'}$, R^2 , and $R^{2'}$ are H.

A preferred formula for drug, D^1 , is the following:

Another preferred embodiment of drug D¹ is the following:

Yet additional preferred embodiments of drug D¹ are the following:

In another exemplary embodiment of the current invention, the cytotoxic drug may be a tubulysin analog or related compound, such as the compounds described by the structure according to Formula 13:

(13).

where R_1 and R_2 are H or a lower alkyl, or are more particularly isobutyl, ethyl, propyl, or *t*-butyl and R_3 is H or OH. Tubulysin and its use in treating cancer has been described in, for example, PCT Publications WO 2004/005327 and WO 2004/005326. The production of tubulysin compounds is described in DE10008089. Methods that may be used to link the tubulysin to various linkers of the current invention are provided in the examples. Preferred tubulysin analogs are Tubulysin A-F.

Preferred Duocarmycin and CBI Conjugates

The peptide, hydrazine or disulfide linkers of the invention can be used in conjugates containing duocarmycin or CBI analogs as cytotoxic agents. Preferred conjugates of the invention are described in further detail below. Unless otherwise indicated, substituents are defined as set forth above in the sections regarding cytotoxins, peptide linkers, hydrazine linkers and disulfide linkers.

A. Peptide Linker Conjugates

In a preferred embodiment, the invention provides a peptide linker conjugate having
5 the structure:

or

wherein X^1 is a halogen;

X is a member selected from O, S and NR^{23} ;

15 R^{23} is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl; and

R^4 , $R^{4'}$, R^5 and $R^{5'}$ are members independently selected from the
group consisting of H, substituted alkyl, unsubstituted alkyl, substituted aryl, unsubstituted
aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl,
20 unsubstituted heterocycloalkyl, halogen, NO_2 , $NR^{15}R^{16}$, $NC(O)R^{15}$, $OC(O)NR^{15}R^{16}$,
 $OC(O)OR^{15}$, $C(O)R^{15}$, OR^{15} , and $O(CH_2)_nN(CH_3)_2$

wherein

n is an integer from 1 to 20; and

R¹⁵ and R¹⁶ are independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, and substituted or unsubstituted, wherein R¹⁵ and R¹⁶ together with the nitrogen atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more heteroatoms.

Non-limiting examples of such conjugates include the following structures:

and

5

wherein X¹ is Cl or Br;

and wherein Ab is an antibody, or fragment thereof.

10 In another preferred embodiment, the invention provides a conjugate having the structure:

or

wherein X^1 is a leaving group;

Z and X are members independently selected from O, S and NR^{23} ,

5 wherein R^{23} is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl; and

R^3 is selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl, unsubstituted heterocycloalkyl, halogen, NO_2 , $NR^{15}R^{16}$,
 10 $NC(O)R^{15}$, $OC(O)NR^{15}R^{16}$, $OC(O)OR^{15}$, $C(O)R^{15}$, OR^{15} , and $O(CH_2)_nN(CH_3)_2$

wherein

n is an integer from 1 to 20;

R^{15} and R^{16} are independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl,
 15 substituted or unsubstituted heteroaryl, and substituted or unsubstituted, wherein R^{15} and R^{16} together with the nitrogen atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more heteroatoms.

Non-limiting examples of such conjugates include the following structures:

20

and

wherein each b is independently an integer from 0 to 20, and Ab is an antibody, or fragment thereof.

In yet other preferred embodiments, the invention provides a peptide linker conjugate selected from the following structures:

5

and

wherein X^1 is Cl or Br, and Ab is an antibody, or fragment thereof.

In still other embodiments, the invention provides a peptide linker conjugate selected
5 from the following structures:

10 and

wherein X^1 is Cl or Br, and Ab is an antibody, or fragment thereof.

In still other embodiments, the invention provides a peptide linker conjugate having
15 the following structure:

wherein X¹ is Cl or Br, and Ab is an antibody or fragment thereof.

Other compounds include the following, which can be conjugated to, for example, an antibody or a fragment thereof:

and

and

wherein r is an integer in the range from 0 to 24. In one embodiment, r is 4.

B. Hydrazine Linker Conjugates

5

In a preferred embodiment, the invention provides a hydrazine linker conjugate having the structure:

10

In another preferred embodiment, the invention provides a hydrazine linker conjugate having the structure:

5 and

In yet other preferred embodiments, the invention provides a hydrazine linker conjugate having structure selected from:

10

and

wherein PEG is a polyethylene glycol moiety and X¹ is Cl or Br.

- 5 In still other preferred embodiments, the invention provides a hydrazine linker conjugate selected from the following structures:

10

and

5 wherein X¹ is Cl or Br, and Ab is an antibody, or fragment thereof.

In yet another preferred embodiment, there is a hydrazine linker conjugate selected from the following structures:

10

and

5

C. Disulfide Linker Conjugates

In a preferred embodiment, the invention provides a disulfide linker conjugate having the structure:

10

and

Non-limiting examples of such structures include the following:

5

10

and

wherein X^1 is Cl or Br, and Ab is an antibody, or fragment thereof.

5

LIGANDS

The ligands of the current invention are depicted as " X^4 ". In this invention, X^4 represents a member selected from the group consisting of protected reactive functional groups, unprotected reactive functional groups, detectable labels, and targeting agents.

10 Preferred ligands are targeting agents, such as antibodies and fragments thereof.

In a preferred embodiment, the group X^4 can be described as a member selected from R^{29} , $COOR^{29}$, $C(O)NR^{29}$, and $C(O)NNR^{29}$ wherein R^{29} is a member selected from substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl and substituted or unsubstituted heteroaryl. In yet another exemplary embodiment, R^{29} is a member selected

15 from H; OH; $NHNH_2$;

wherein R^{30} represents substituted or unsubstituted alkyl terminated with a reactive functional group, substituted or unsubstituted heteroaryl terminated with a functional

20 group. The above structures act as reactive protective groups that can be reacted with, for example, a side chain of an amino acid of a targeting agent, such as an antibody, to thereby link the targeting agent to the linker-drug moiety.

Targeting Agents

The linker arms and cytotoxins of the invention can be linked to targeting agents that selectively deliver a payload to a cell, organ or region of the body. Exemplary targeting agents such as antibodies (e.g., chimeric, humanized and human), ligands for receptors, lectins, saccharides, antibodies, and the like are recognized in the art and are useful without limitation in practicing the present invention. Other targeting agents include a class of compounds that do not include specific molecular recognition motifs include macromolecules such as poly(ethylene glycol), polysaccharide, polyamino acids and the like, which add molecular mass to the cytotoxin. The additional molecular mass affects the pharmacokinetics of the cytotoxin, e.g., serum half-life.

In an exemplary embodiment, the invention provides a cytotoxin, linker or cytotoxin-linker conjugate with a targeting agent that is a biomolecule, e.g, an antibody, receptor, peptide, lectin, saccharide, nucleic acid or a combination thereof. Routes to exemplary conjugates of the invention are set forth in the Schemes above.

Biomolecules useful in practicing the present invention can be derived from any source. The biomolecules can be isolated from natural sources or can be produced by synthetic methods. Proteins can be natural proteins or mutated proteins. Mutations can be effected by chemical mutagenesis, site-directed mutagenesis or other means of inducing mutations known to those of skill in the art. Proteins useful in practicing the instant invention include, for example, enzymes, antigens, antibodies and receptors. Antibodies can be either polyclonal or monoclonal, but most preferably are monoclonal. Peptides and nucleic acids can be isolated from natural sources or can be wholly or partially synthetic in origin.

In a preferred embodiment, the targeting agent is an antibody, or antibody fragment, that is selected based on its specificity for an antigen expressed on a target cell, or at a target site, of interest. A wide variety of tumor-specific or other disease-specific antigens have been identified and antibodies to those antigens have been used or proposed for use in the treatment of such tumors or other diseases. The antibodies that are known in the art can be used in the conjugates of the invention, in particular for the treatment of the disease with which the target antigen is associated. Non-limiting examples of target antigens (and their associated diseases) to which an antibody-linker-drug conjugate of the invention

can be targeted include: Her2 (breast cancer), CD20 (lymphomas), EGFR (solid tumors), CD22 (lymphomas, including non-Hodgkin's lymphoma), CD52 (chronic lymphocytic leukemia), CD33 (acute myelogenous leukemia), CD4 (lymphomas, autoimmune diseases, including rheumatoid arthritis), CD30 (lymphomas, including non-Hodgkin's lymphoma),
5 Muc18 (melanoma), integrins (solid tumors), PSMA (prostate cancer, benign prostatic hyperplasia), CEA (colorectal cancer), CD11a (psoriasis), CD80 (psoriasis), CD23 (asthma), CD40L (immune thrombocytopenic purpura), CTLA4 (T cell lymphomas) and BLys (autoimmune diseases, including systemic lupus erythematosus).

In those embodiments wherein the recognition moiety is a protein or antibody,
10 the protein can be tethered to a surface or a self assembled monolayer (SAM) component or connected through a spacer arm by any reactive peptide residue available on the surface of the protein. In preferred embodiments, the reactive groups are amines or carboxylates. In particularly preferred embodiments, the reactive groups are the ϵ -amine groups of lysine residues. Furthermore, these molecules can be adsorbed onto the surface of the substrate or
15 SAM by non-specific interactions (*e.g.*, chemisorption, physisorption).

Recognition moieties which are antibodies can be used to recognize analytes which are proteins, peptides, nucleic acids, saccharides or small molecules such as drugs, herbicides, pesticides, industrial chemicals and agents of war. Methods of raising antibodies for specific molecules are well-known to those of skill in the art. *See*, United States Patents
20 No. 5/147,786, issued to Feng *et al.* on September 15, 1992; No. 5/334,528, issued to Stanker *et al.* on August 2, 1994; No. 5/686,237, issued to Al-Bayati, M.A.S. on November 11, 1997; and No. 5/573,922, issued to Hoess *et al.* on November 12, 1996. Methods for attaching antibodies to surfaces are also art-known. *See*, Delamarche *et al.* *Langmuir* **12**:1944-1946 (1996).

25 Targeting agents can be attached to the linkers of the invention by any available reactive group. For example, peptides can be attached through an amine, carboxyl, sulfhydryl, or hydroxyl group. Such a group can reside at a peptide terminus or at a site internal to the peptide chain. Nucleic acids can be attached through a reactive group on a base (*e.g.*, exocyclic amine) or an available hydroxyl group on a sugar moiety (*e.g.*, 3'- or 5'-
30 hydroxyl). The peptide and nucleic acid chains can be further derivatized at one or more

sites to allow for the attachment of appropriate reactive groups onto the chain. *See*, Chrisey *et al. Nucleic Acids Res.* **24**:3031-3039 (1996).

When the peptide or nucleic acid is a fully or partially synthetic molecule, a reactive group or masked reactive group can be incorporated during the process of the synthesis. Many derivatized monomers appropriate for reactive group incorporation in both peptides and nucleic acids are known to those of skill in the art. *See*, for example, *THE PEPTIDES: ANALYSIS, SYNTHESIS, BIOLOGY*, Vol. 2: "Special Methods in Peptide Synthesis," Gross, E. and Melenhofer, J., Eds., Academic Press, New York (1980). Many useful monomers are commercially available (Bachem, Sigma, *etc.*). This masked group can then be unmasked following the synthesis, at which time it becomes available for reaction with a component of a compound of the invention.

Exemplary nucleic acid targeting agents include aptamers, antisense compounds, and nucleic acids that form triple helices. Typically, a hydroxyl group of a sugar residue, an amino group from a base residue, or a phosphate oxygen of the nucleotide is utilized as the needed chemical functionality to couple the nucleotide-based targeting agent to the cytotoxin. However, one of skill in the art will readily appreciate that other "non-natural" reactive functionalities can be appended to a nucleic acid by conventional techniques. For example, the hydroxyl group of the sugar residue can be converted to a mercapto or amino group using techniques well known in the art.

Aptamers (or nucleic acid antibody) are single- or double-stranded DNA or single-stranded RNA molecules that bind specific molecular targets. Generally, aptamers function by inhibiting the actions of the molecular target, *e.g.*, proteins, by binding to the pool of the target circulating in the blood. Aptamers possess chemical functionality and thus, can covalently bond to cytotoxins, as described herein.

Although a wide variety of molecular targets are capable of forming non-covalent but specific associations with aptamers, including small molecules drugs, metabolites, cofactors, toxins, saccharide-based drugs, nucleotide-based drugs, glycoproteins, and the like, generally the molecular target will comprise a protein or peptide, including serum proteins, kinins, eicosanoids, cell surface molecules, and the like. Examples of aptamers include Gilead's antithrombin inhibitor GS 522 and its derivatives (Gilead Science, Foster City, Calif.). *See also*, Macaya *et al. Proc. Natl. Acad. Sci. USA* **90**:3745-9 (1993);

Bock *et al.* *Nature (London)* **355**:564-566 (1992) and Wang *et al.* *Biochem.* **32**:1899-904 (1993).

Aptamers specific for a given biomolecule can be identified using techniques known in the art. *See, e.g.,* Toole *et al.* (1992) PCT Publication No. WO 92/14843; Tuerk and Gold (1991) PCT Publication No. WO 91/19813; Weintraub and Hutchinson (1992) PCT Publication No. 92/05285; and Ellington and Szostak, *Nature* **346**:818 (1990). Briefly, these techniques typically involve the complexation of the molecular target with a random mixture of oligonucleotides. The aptamer-molecular target complex is separated from the uncomplexed oligonucleotides. The aptamer is recovered from the separated complex and amplified. This cycle is repeated to identify those aptamer sequences with the highest affinity for the molecular target.

For diseases that result from the inappropriate expression of genes, specific prevention or reduction of the expression of such genes represents an ideal therapy. In principle, production of a particular gene product may be inhibited, reduced or shut off by hybridization of a single-stranded deoxynucleotide or ribodeoxynucleotide complementary to an accessible sequence in the mRNA, or a sequence within the transcript that is essential for pre-mRNA processing, or to a sequence within the gene itself. This paradigm for genetic control is often referred to as antisense or antigene inhibition. Additional efficacy is imparted by the conjugation to the nucleic acid of an alkylating agent, such as those of the present invention.

Antisense compounds are nucleic acids designed to bind and disable or prevent the production of the mRNA responsible for generating a particular protein. Antisense compounds include antisense RNA or DNA, single or double stranded, oligonucleotides, or their analogs, which can hybridize specifically to individual mRNA species and prevent transcription and/or RNA processing of the mRNA species and/or translation of the encoded polypeptide and thereby effect a reduction in the amount of the respective encoded polypeptide. Ching *et al.* *Proc. Natl. Acad. Sci. U.S.A.* **86**:10006-10010 (1989); Broder *et al.* *Ann. Int. Med.* **113**:604-618 (1990); Loreau *et al.* *FEBS Letters* **274**:53-56 (1990); Holcenberg *et al.* WO91/11535; WO91/09865; WO91/04753; WO90/13641; WO 91/13080, WO 91/06629, and EP 386563). Due to their exquisite target sensitivity and

selectivity, antisense oligonucleotides are useful for delivering therapeutic agents, such as the cytotoxins of the invention to a desired molecular target.

Others have reported that nucleic acids can bind to duplex DNA via triple helix formation and inhibit transcription and/or DNA synthesis. Triple helix compounds (also referred to as triple strand drugs) are oligonucleotides that bind to sequences of double-stranded DNA and are intended to inhibit selectively the transcription of disease-causing genes, such as viral genes, *e.g.*, HIV and herpes simplex virus, and oncogenes, *i.e.*, they stop protein production at the cell nucleus. These drugs bind directly to the double stranded DNA in the cell's genome to form a triple helix and prevent the cell from making a target protein. *See, e.g.*, PCT publications Nos. WO 92/10590, WO 92/09705, WO91/06626, and U.S. Pat. No. 5,176,996. Thus, the cytotoxins of the present invention are also conjugated to nucleic acid sequences that form triple helices.

The site specificity of nucleic acids (*e.g.*, antisense compounds and triple helix drugs) is not significantly affected by modification of the phosphodiester linkage or by chemical modification of the oligonucleotide terminus. Consequently, these nucleic acids can be chemically modified; enhancing the overall binding stability, increasing the stability with respect to chemical degradation, increasing the rate at which the oligonucleotides are transported into cells, and conferring chemical reactivity to the molecules. The general approach to constructing various nucleic acids useful in antisense therapy has been reviewed by van der Krol *et al.*, *Biotechniques* 6:958-976 (1988) and Stein *et al.* *Cancer Res.* 48:2659-2668 (1988). Therefore, in an exemplary embodiment, the cytotoxins of the invention are conjugated to a nucleic acid by modification of the phosphodiester linkage.

Moreover, aptamers, antisense compounds and triple helix drugs bearing cytotoxins of the invention can also include nucleotide substitutions, additions, deletions, or transpositions, so long as specific hybridization to or association with the relevant target sequence is retained as a functional property of the oligonucleotide. For example, some embodiments will employ phosphorothioate analogs which are more resistant to degradation by nucleases than their naturally occurring phosphate diester counterparts and are thus expected to have a higher persistence in vivo and greater potency (*see, e.g.*, Campbell *et al.*, *J. Biochem. Biophys. Methods* 20:259-267(1990)). Phosphoramidate derivatives of oligonucleotides also are known to bind to complementary polynucleotides and have the

additional capability of accommodating covalently attached ligand species and will be amenable to the methods of the present invention. *See, for example, Froehler et al., Nucleic Acids Res.* **16**(11):4831 (1988).

In some embodiments the aptamers, antisense compounds and triple helix
5 drugs will comprise O-methylribonucleotides (EP Publication No. 360609). Chimeric oligonucleotides may also be used (Dagle *et al.*, *Nucleic Acids Res.* **18**: 4751 (1990)). For some applications, antisense oligonucleotides and triple helix may comprise polyamide nucleic acids (Nielsen *et al.*, *Science* **254**: 1497 (1991) and PCT publication No. WO 90/15065) or other cationic derivatives (Letsinger *et al.*, *J. Am. Chem. Soc.* **110**: 4470-4471
10 (1988)). Other applications may utilize oligonucleotides wherein one or more of the phosphodiester linkages has been substituted with an isosteric group, such as a 2-4 atom long internucleoside linkage as described in PCT publication Nos. WO 92/05186 and 91/06556, or a formacetal group (Matteucci *et al.*, *J. Am. Chem. Soc.* **113**: 7767-7768 (1991)) or an amide group (Nielsen *et al.*, *Science* **254**: 1497-1500 (1991)).

15 In addition, nucleotide analogs, for example wherein the sugar or base is chemically modified, can be employed in the present invention. "Analogous" forms of purines and pyrimidines are those generally known in the art, many of which are used as chemotherapeutic agents. An exemplary but not exhaustive list includes 4-acetylcytosine, 5-
20 (carboxyhydroxymethyl) uracil, 5-fluorouracil, 5-bromouracil, 5-carboxymethylaminomethyl- 2-thiouracil, 5-carboxymethylaminomethyluracil, dihydrouracil, inosine, N⁶-isopentenyladenine, 1-methyladenine, 1-methylpseudouracil, 1-methylguanine, 1-methylinosine, 2,2-dimethylguanine, 2-methyladenine, 2-methylguanine, 3-methylcytosine, 5-methylcytosine, N⁶-methyladenine, 7-methylguanine, 5-
25 methylaminomethyluracil, 5-methoxyaminomethyl-2-thiouracil, β-D-mannosylqueosine, 5-methoxycarbonylmethyluracil, 5-methoxyuracil, 2-methylthio-N⁶-isopentenyladenine, uracil-5-oxyacetic acid methylester, uracil-5-oxyacetic acid (v), wybutoxosine, pseudouracil, queosine, 2-thiocytosine, 5-methyl-2-thiouracil, 2-thiouracil, 4-thiouracil, 5-methyluracil, N-
30 uracil-5-oxyacetic acid methylester, uracil-5-oxyacetic acid (v), pseudouracil, queosine, 2-thiocytosine, and 2,6-diaminopurine. In addition, the conventional bases by halogenated bases. Furthermore, the 2'-furanose position on the base can have a non-charged bulky group

substitution. Examples of non-charged bulky groups include branched alkyls, sugars and branched sugars.

Terminal modification also provides a useful procedure to conjugate the cytotoxins to the nucleic acid, modify cell type specificity, pharmacokinetics, nuclear permeability, and absolute cell uptake rate for oligonucleotide pharmaceutical agents. For example, an array of substitutions at the 5' and 3' ends to include reactive groups are known, which allow covalent attachment of the cytotoxins. See, *e.g.*, OLIGODEOXYNUCLEOTIDES: ANTISENSE INHIBITORS OF GENE EXPRESSION, (1989) Cohen, Ed., CRC Press; PROSPECTS FOR ANTISENSE NUCLEIC ACID THERAPEUTICS FOR CANCER AND AIDS, (1991), Wickstrom, Ed., Wiley-Liss; GENE REGULATION: BIOLOGY OF ANTISENSE RNA AND DNA, (1992) Erickson and Izant, Eds., Raven Press; and ANTISENSE RNA AND DNA, (1992), Murray, Ed., Wiley-Liss. For general methods relating to antisense compounds, *see*, ANTISENSE RNA AND DNA, (1988), D. A. Melton, Ed., Cold Spring Harbor Laboratory, Cold Spring Harbor, N.Y.).

15 Detectable Labels

The particular label or detectable group used in conjunction with the compounds and methods of the invention is generally not a critical aspect of the invention, as long as it does not significantly interfere with the activity or utility of the compound of the invention. The detectable group can be any material having a detectable physical or chemical property. Such detectable labels have been well developed in the field of immunoassays and, in general, most any label useful in such methods can be applied to the present invention. Thus, a label is any composition detectable by spectroscopic, photochemical, biochemical, immunochemical, electrical, optical or chemical means. Useful labels in the present invention include magnetic beads (*e.g.*, DYNABEADS™), fluorescent dyes (*e.g.*, fluorescein isothiocyanate, Texas red, rhodamine, and the like), radiolabels (*e.g.*, ³H, ¹²⁵I, ³⁵S, ¹⁴C, or ³²P), enzymes (*e.g.*, horse radish peroxidase, alkaline phosphatase and others commonly used in an ELISA), and colorimetric labels such as colloidal gold or colored glass or plastic beads (*e.g.*, polystyrene, polypropylene, latex, etc.).

The label may be coupled directly or indirectly to a compound of the invention according to methods well known in the art. As indicated above, a wide variety of labels may be used, with the choice of label depending on sensitivity required, ease of

conjugation with the compound, stability requirements, available instrumentation, and disposal provisions.

When the compound of the invention is conjugated to a detectable label, the label is preferably a member selected from the group consisting of radioactive isotopes, fluorescent agents, fluorescent agent precursors, chromophores, enzymes and combinations thereof. Methods for conjugating various groups to antibodies are well known in the art. For example, a detectable label that is frequently conjugated to an antibody is an enzyme, such as horseradish peroxidase, alkaline phosphatase, β -galactosidase, and glucose oxidase.

Non-radioactive labels are often attached by indirect means. Generally, a ligand molecule (*e.g.*, biotin) is covalently bound to a component of the conjugate. The ligand then binds to another molecules (*e.g.*, streptavidin) molecule, which is either inherently detectable or covalently bound to a signal system, such as a detectable enzyme, a fluorescent compound, or a chemiluminescent compound.

Components of the conjugates of the invention can also be conjugated directly to signal generating compounds, *e.g.*, by conjugation with an enzyme or fluorophore. Enzymes of interest as labels will primarily be hydrolases, particularly phosphatases, esterases and glycosidases, or oxidotases, particularly peroxidases. Fluorescent compounds include fluorescein and its derivatives, rhodamine and its derivatives, dansyl, umbelliferone, *etc.* Chemiluminescent compounds include luciferin, and 2,3-dihydrophthalazinediones, *e.g.*, luminol. For a review of various labeling or signal producing systems that may be used, *see*, U.S. Patent No. 4,391,904.

Means of detecting labels are well known to those of skill in the art. Thus, for example, where the label is a radioactive label, means for detection include a scintillation counter or photographic film as in autoradiography. Where the label is a fluorescent label, it may be detected by exciting the fluorochrome with the appropriate wavelength of light and detecting the resulting fluorescence. The fluorescence may be detected visually, by means of photographic film, by the use of electronic detectors such as charge coupled devices (CCDs) or photomultipliers and the like. Similarly, enzymatic labels may be detected by providing the appropriate substrates for the enzyme and detecting the resulting reaction product. Finally simple colorimetric labels may be detected simply by observing the color associated

with the label. Thus, in various dipstick assays, conjugated gold often appears pink, while various conjugated beads appear the color of the bead.

Fluorescent labels are presently preferred as they have the advantage of requiring few precautions in handling, and being amenable to high-throughput visualization techniques (optical analysis including digitization of the image for analysis in an integrated system comprising a computer). Preferred labels are typically characterized by one or more of the following: high sensitivity, high stability, low background, low environmental sensitivity and high specificity in labeling. Many fluorescent labels are commercially available from the SIGMA chemical company (Saint Louis, MO), Molecular Probes (Eugene, OR), R&D systems (Minneapolis, MN), Pharmacia LKB Biotechnology (Piscataway, NJ), CLONTECH Laboratories, Inc. (Palo Alto, CA), Chem Genes Corp., Aldrich Chemical Company (Milwaukee, WI), Glen Research, Inc., GIBCO BRL Life Technologies, Inc. (Gaithersburg, MD), Fluka Chemica- Biochemika Analytika (Fluka Chemie AG, Buchs, Switzerland), and Applied Biosystems (Foster City, CA), as well as many other commercial sources known to one of skill. Furthermore, those of skill in the art will recognize how to select an appropriate fluorophore for a particular application and, if it not readily available commercially, will be able to synthesize the necessary fluorophore de novo or synthetically modify commercially available fluorescent compounds to arrive at the desired fluorescent label.

In addition to small molecule fluorophores, naturally occurring fluorescent proteins and engineered analogues of such proteins are useful in the present invention. Such proteins include, for example, green fluorescent proteins of cnidarians (Ward *et al.*, *Photochem. Photobiol.* **35**:803-808 (1982); Levine *et al.*, *Comp. Biochem. Physiol.*, **72B**:77-85 (1982)), yellow fluorescent protein from *Vibrio fischeri* strain (Baldwin *et al.*, *Biochemistry* **29**:5509-15 (1990)), Peridinin-chlorophyll from the dinoflagellate *Symbiodinium* sp. (Morris *et al.*, *Plant Molecular Biology* **24**:673:77 (1994)), phycobiliproteins from marine cyanobacteria, such as *Synechococcus*, *e.g.*, phycoerythrin and phycocyanin (Wilbanks *et al.*, *J. Biol. Chem.* **268**:1226-35 (1993)), and the like.

Generally, prior to forming the linkage between the cytotoxin and the targeting (or other) agent, and optionally, the spacer group, at least one of the chemical functionalities will be activated. One skilled in the art will appreciate that a variety of

chemical functionalities, including hydroxy, amino, and carboxy groups, can be activated using a variety of standard methods and conditions. For example, a hydroxyl group of the cytotoxin or targeting agent can be activated through treatment with phosgene to form the corresponding chloroformate, or p-nitrophenylchloroformate to form the corresponding carbonate.

In an exemplary embodiment, the invention makes use of a targeting agent that includes a carboxyl functionality. Carboxyl groups may be activated by, for example, conversion to the corresponding acyl halide or active ester. This reaction may be performed under a variety of conditions as illustrated in March, supra pp. 388-89. In an exemplary embodiment, the acyl halide is prepared through the reaction of the carboxyl-containing group with oxalyl chloride. The activated agent is reacted with a cytotoxin or cytotoxin-linker arm combination to form a conjugate of the invention. Those of skill in the art will appreciate that the use of carboxyl-containing targeting agents is merely illustrative, and that agents having many other functional groups can be conjugated to the linkers of the invention.

Reactive Functional Groups

For clarity of illustration the succeeding discussion focuses on the conjugation of a cytotoxin of the invention to a targeting agent. The focus exemplifies one embodiment of the invention from which, others are readily inferred by one of skill in the art. No limitation of the invention is implied, by focusing the discussion on a single embodiment.

Exemplary compounds of the invention bear a reactive functional group, which is generally located on a substituted or unsubstituted alkyl or heteroalkyl chain, allowing their facile attachment to another species. A convenient location for the reactive group is the terminal position of the chain.

Reactive groups and classes of reactions useful in practicing the present invention are generally those that are well known in the art of bioconjugate chemistry. The reactive functional group may be protected or unprotected, and the protected nature of the group may be changed by methods known in the art of organic synthesis. Currently favored classes of reactions available with reactive cytotoxin analogues are those which proceed under relatively mild conditions. These include, but are not limited to nucleophilic substitutions (*e.g.*, reactions of amines and alcohols with acyl halides, active esters),

electrophilic substitutions (*e.g.*, enamine reactions) and additions to carbon-carbon and carbon-heteroatom multiple bonds (*e.g.*, Michael reaction, Diels-Alder addition). These and other useful reactions are discussed in, for example, March, *ADVANCED ORGANIC CHEMISTRY*, 3rd Ed., John Wiley & Sons, New York, 1985; Hermanson, *BIOCONJUGATE*
5 *TECHNIQUES*, Academic Press, San Diego, 1996; and Feeney *et al.*, *MODIFICATION OF PROTEINS*; *Advances in Chemistry Series*, Vol. 198, American Chemical Society, Washington, D.C., 1982.

Exemplary reaction types include the reaction of carboxyl groups and various derivatives thereof including, but not limited to, N-hydroxysuccinimide esters, N-
10 hydroxybenztriazole esters, acid halides, acyl imidazoles, thioesters, p-nitrophenyl esters, alkyl, alkenyl, alkynyl and aromatic esters. Hydroxyl groups can be converted to esters, ethers, aldehydes, *etc.* Haloalkyl groups are converted to new species by reaction with, for example, an amine, a carboxylate anion, thiol anion, carbanion, or an alkoxide ion. Dienophile (*e.g.*, maleimide) groups participate in Diels-Alder. Aldehyde or ketone groups
15 can be converted to imines, hydrazones, semicarbazones or oximes, or via such mechanisms as Grignard addition or alkyllithium addition. Sulfonyl halides react readily with amines, for example, to form sulfonamides. Amine or sulfhydryl groups are, for example, acylated, alkylated or oxidized. Alkenes, can be converted to an array of new species using cycloadditions, acylation, Michael addition, *etc.* Epoxides react readily with amines and
20 hydroxyl compounds.

One skilled in the art will readily appreciate that many of these linkages may be produced in a variety of ways and using a variety of conditions. For the preparation of esters, *see, e.g.*, March *supra* at 1157; for thioesters, *see*, March, *supra* at 362-363, 491, 720-722, 829, 941, and 1172; for carbonates, *see*, March, *supra* at 346-347; for carbamates, *see*,
25 March, *supra* at 1156-57; for amides, *see*, March *supra* at 1152; for ureas and thioureas, *see*, March *supra* at 1174; for acetals and ketals, *see*, Greene *et al. supra* 178-210 and March *supra* at 1146; for acyloxyalkyl derivatives, *see*, *PRODRUGS: TOPICAL AND OCULAR DRUG DELIVERY*, K. B. Sloan, ed., Marcel Dekker, Inc., New York, 1992; for enol esters, *see*,

5 The reactive functional groups can be unprotected and chosen such that they do not participate in, or interfere with, the reactions. Alternatively, a reactive functional group can be protected from participating in the reaction by the presence of a protecting group. Those of skill in the art will understand how to protect a particular functional group from interfering with a chosen set of reaction conditions. For examples of useful protecting groups, *See* Greene *et al.*, PROTECTIVE GROUPS IN ORGANIC SYNTHESIS, John Wiley & Sons,
10 New York, 1991.

Typically, the targeting agent is linked covalently to a cytotoxin using standard chemical techniques through their respective chemical functionalities. Optionally, the linker or agent is coupled to the agent through one or more spacer groups. The spacer groups can be equivalent or different when used in combination.

15 Generally, prior to forming the linkage between the cytotoxin and the reactive functional group, and optionally, the spacer group, at least one of the chemical functionalities will be activated. One skilled in the art will appreciate that a variety of chemical functionalities, including hydroxy, amino, and carboxy groups, can be activated using a variety of standard methods and conditions. In an exemplary embodiment, the invention
20 comprises a carboxyl functionality as a reactive functional group. Carboxyl groups may be activated as described hereinabove.

PHARMACEUTICAL FORMULATIONS AND ADMINISTRATION

25 In another preferred embodiment, the present invention provides a pharmaceutical formulation comprising a compound of the invention and a pharmaceutically acceptable carrier.

The compounds described herein including pharmaceutically acceptable carriers such as addition salts or hydrates thereof, can be delivered to a patient using a wide variety of routes or modes of administration. Suitable routes of administration include, but
30 are not limited to, inhalation, transdermal, oral, rectal, transmucosal, intestinal and parenteral administration, including intramuscular, subcutaneous and intravenous injections. Preferably,

the conjugates of the invention comprising an antibody or antibody fragment as the targeting moiety are administered parenterally, more preferably intravenously.

As used herein, the terms "administering" or "administration" are intended to encompass all means for directly and indirectly delivering a compound to its intended site of
5 action.

The compounds described herein, or pharmaceutically acceptable salts and/or hydrates thereof, may be administered singly, in combination with other compounds of the invention, and/or in cocktails combined with other therapeutic agents. Of course, the choice of therapeutic agents that can be co-administered with the compounds of the invention will
10 depend, in part, on the condition being treated.

For example, when administered to patients suffering from a disease state caused by an organism that relies on an autoinducer, the compounds of the invention can be administered in cocktails containing agents used to treat the pain, infection and other symptoms and side effects commonly associated with the disease. Such agents include, *e.g.*,
15 analgesics, antibiotics, *etc.*

When administered to a patient undergoing cancer treatment, the compounds may be administered in cocktails containing anti-cancer agents and/or supplementary potentiating agents. The compounds may also be administered in cocktails containing agents that treat the side-effects of radiation therapy, such as anti-emetics, radiation protectants, *etc.*
20

Supplementary potentiating agents that can be co-administered with the compounds of the invention include, *e.g.*, tricyclic anti-depressant drugs (*e.g.*, imipramine, desipramine, amitriptyline, clomipramine, trimipramine, doxepin, nortriptyline, protriptyline, amoxapine and maprotiline); non-tricyclic and anti-depressant drugs (*e.g.*, sertraline, trazodone and citalopram); Ca⁺² antagonists (*e.g.*, verapamil, nifedipine, nitrendipine and
25 caroverine); amphotericin; triparanol analogues (*e.g.*, tamoxifen); antiarrhythmic drugs (*e.g.*, quinidine); antihypertensive drugs (*e.g.*, reserpine); thiol depleters (*e.g.*, buthionine and sulfoximine); and calcium leucovorin.

The active compound(s) of the invention are administered *per se* or in the form of a pharmaceutical composition wherein the active compound(s) is in admixture with
30 one or more pharmaceutically acceptable carriers, excipients or diluents. Pharmaceutical compositions for use in accordance with the present invention are typically formulated in a

conventional manner using one or more physiologically acceptable carriers comprising excipients and auxiliaries, which facilitate processing of the active compounds into preparations which, can be used pharmaceutically. Proper formulation is dependent upon the route of administration chosen.

5 For transmucosal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art.

For oral administration, the compounds can be formulated readily by combining the active compound(s) with pharmaceutically acceptable carriers well known in the art. Such carriers enable the compounds of the invention to be formulated as tablets, pills, dragees, capsules, liquids, gels, syrups, slurries, suspensions and the like, for oral
10 ingestion by a patient to be treated. Pharmaceutical preparations for oral use can be obtained solid excipient, optionally grinding a resulting mixture, and processing the mixture of granules, after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores. Suitable excipients are, in particular, fillers such as sugars, including lactose, sucrose,
15 mannitol, or sorbitol; cellulose preparations such as, for example, maize starch, wheat starch, rice starch, potato starch, gelatin, gum tragacanth, methyl cellulose, hydroxypropylmethyl-cellulose, sodium carboxymethylcellulose, and/or polyvinylpyrrolidone (PVP). If desired, disintegrating agents may be added, such as the cross-linked polyvinyl pyrrolidone, agar, or alginic acid or a salt thereof such as sodium
20 alginate.

Dragee cores are provided with suitable coatings. For this purpose, concentrated sugar solutions may be used, which may optionally contain gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents or solvent mixtures. Dyestuffs or pigments may be
25 added to the tablets or dragee coatings for identification or to characterize different combinations of active compound doses.

Pharmaceutical preparations, which can be used orally, include push-fit capsules made of gelatin, as well as soft, sealed capsules made of gelatin and a plasticizer, such as glycerol or sorbitol. The push-fit capsules can contain the active ingredients in
30 admixture with filler such as lactose, binders such as starches, and/or lubricants such as talc or magnesium stearate and, optionally, stabilizers. In soft capsules, the active compounds

may be dissolved or suspended in suitable liquids, such as fatty oils, liquid paraffin, or liquid polyethylene glycols. In addition, stabilizers may be added. All formulations for oral administration should be in dosages suitable for such administration.

5 For buccal administration, the compositions may take the form of tablets or lozenges formulated in conventional manner.

For administration by inhalation, the compounds for use according to the present invention are conveniently delivered in the form of an aerosol spray presentation from pressurized packs or a nebulizer, with the use of a suitable propellant, *e.g.*, dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon dioxide
10 or other suitable gas. In the case of a pressurized aerosol the dosage unit may be determined by providing a valve to deliver a metered amount. Capsules and cartridges of *e.g.*, gelatin for use in an inhaler or insufflator may be formulated containing a powder mix of the compound and a suitable powder base such as lactose or starch.

The compounds may be formulated for parenteral administration by injection, *e.g.*, by bolus injection or continuous infusion. Injection is a preferred method of
15 administration for the compositions of the current invention. Formulations for injection may be presented in unit dosage form, *e.g.*, in ampoules or in multi-dose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending,
20 stabilizing and/or dispersing agents may be added, such as the cross-linked polyvinyl pyrrolidone, agar, or alginic acid or a salt thereof such as sodium alginate.

Pharmaceutical formulations for parenteral administration include aqueous solutions of the active compounds in water-soluble form. Additionally, suspensions of the active compounds may be prepared as appropriate oily injection suspensions. Suitable
25 lipophilic solvents or vehicles include fatty oils such as sesame oil, or synthetic fatty acid esters, such as ethyl oleate or triglycerides, or liposomes. Aqueous injection suspensions may contain substances, which increase the viscosity of the suspension, such as sodium carboxymethyl cellulose, sorbitol, or dextran. Optionally, the suspension may also contain suitable stabilizers or agents, which increase the solubility of the compounds to allow for the
30 preparation of highly, concentrated solutions. For injection, the agents of the invention may

be formulated in aqueous solutions, preferably in physiologically compatible buffers such as Hanks's solution, Ringer's solution, or physiological saline buffer.

Alternatively, the active ingredient may be in powder form for constitution with a suitable vehicle, *e.g.*, sterile pyrogen-free water, before use.

5 The compounds may also be formulated in rectal compositions such as suppositories or retention enemas, *e.g.*, containing conventional suppository bases such as cocoa butter or other glycerides.

10 In addition to the formulations described previously, the compounds may also be formulated as a depot preparation. Such long acting formulations may be administered by implantation or transcutaneous delivery (*e.g.*, subcutaneously or intramuscularly), intramuscular injection or a transdermal patch. Thus, for example, the compounds may be formulated with suitable polymeric or hydrophobic materials (*e.g.*, as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

15 The pharmaceutical compositions also may comprise suitable solid or gel phase carriers or excipients. Examples of such carriers or excipients include but are not limited to calcium carbonate, calcium phosphate, various sugars, starches, cellulose derivatives, gelatin, and polymers such as polyethylene glycols.

20 A preferred pharmaceutical composition is a composition formulated for injection such as intravenous injection and includes about 0.01% to about 100% by weight of the drug-ligand conjugate, based upon 100% weight of total pharmaceutical composition. The drug-ligand conjugate may be an antibody-cytotoxin conjugate where the antibody has been selected to target a particular cancer.

25 LIBRARIES

Also within the scope of the present invention are libraries of the cytotoxin, cytotoxin-linker and agent-linker conjugates of the cytotoxins and linkers of the invention. Exemplary libraries include at least 10 compounds, more preferably at least 100 compound, even more preferably at least 1000 compounds and still more preferably at least 100,000
30 compounds. The libraries in a form that is readily queried for a particular property, *e.g.*,

cytotoxicity, cleavage of a linker by an enzyme, or other cleavage reagent. Exemplary forms include chip formats, microarrays, and the like.

Parallel, or combinatorial, synthesis has as its primary objective the generation of a library of diverse molecules which all share a common feature, referred to throughout this description as a scaffold. By substituting different moieties at each of the variable parts of the scaffold molecule, the amount of space explorable in a library grows. Theories and modern medicinal chemistry advocate the concept of occupied space as a key factor in determining the efficacy of a given compound against a given biological target. By creating a diverse library of molecules, which explores a large percentage of the targeted space, the odds of developing a highly efficacious lead compound increase dramatically.

Parallel synthesis is generally conducted on a solid phase support, such as a polymeric resin. The scaffold, or other suitable intermediate is cleavably tethered to the resin by a chemical linker. Reactions are carried out to modify the scaffold while tethered to the particle. Variations in reagents and/or reaction conditions produce the structural diversity, which is the hallmark of each library.

Parallel synthesis of "small" molecules (non-oligomers with a molecular weight of 200-1000) was rarely attempted prior to 1990. *See*, for example, Camps. *et al.*, *Annals de Quimica*, **70**: 848 (1990). Recently, Ellmann disclosed the solid phase-supported parallel (also referred to as "combinatorial") synthesis of eleven benzodiazepine analogs along with some prostaglandins and beta-turn mimetics. These disclosures are exemplified in U.S. Pat. No. 5,288,514. Another relevant disclosure of parallel synthesis of small molecules may be found in U.S. Pat. No. 5,324,483. This patent discloses the parallel synthesis of between 4 and 40 compounds in each of sixteen different scaffolds. Chen *et al.* have also applied organic synthetic strategies to develop non-peptide libraries synthesized using multi-step processes on a polymer support. (Chen *et al.*, *J. Am. Chem. Soc.*, **116**: 2661-2662 (1994)).

Once a library of unique compounds is prepared, the preparation of a library of immunoconjugates, or antibodies can be prepared using the library of autoinducers as a starting point and using the methods described herein.

KITS

In another aspect, the present invention provides kits containing one or more of the compounds or compositions of the invention and directions for using the compound or composition. In an exemplary embodiment, the invention provides a kit for conjugating a linker arm of the invention to another molecule. The kit includes the linker, and directions for attaching the linker to a particular functional group. The kit may also include one or more of a cytotoxic drug, a targeting agent, a detectable label, pharmaceutical salts or buffers. The kit may also include a container and optionally one or more vial, test tube, flask, bottle, or syringe. Other formats for kits will be apparent to those of skill in the art and are within the scope of the present invention.

PURIFICATION

In another exemplary embodiment, the present invention provides a method for isolating a molecular target for a ligand-cytotoxin of the invention, which binds to the ligand X⁴. The method preferably comprises, contacting a cellular preparation that includes the target with an immobilized compound, thereby forming a complex between the receptor and the immobilized compound.

The cytotoxin of the invention can be immobilized on an affinity support by any art-recognized means. Alternatively, the cytotoxin can be immobilized using one or more of the linkers of the invention.

In yet another exemplary embodiment, the invention provides an affinity purification matrix that includes a linker of the invention.

The method of the invention for isolating a target will typically utilize one or more affinity chromatography techniques. Affinity chromatography enables the efficient isolation of species such as biological molecules or biopolymers by utilizing their recognition sites for certain supported chemical structures with a high degree of selectivity. The literature is replete with articles, monographs, and books on the subject of affinity chromatography, including such topics as affinity chromatography supports, crosslinking members, ligands and their preparation and use. A sampling of those references includes: Ostrove, *Methods Enzymol.* **182**: 357-71 (1990); Ferment, *Bioeng.* **70**: 199-209 (1990). Huang *et al.*, *J. Chromatogr.* **492**: 431-69 (1989); "Purification of enzymes by heparin-Sepharose affinity chromatography," *J. Chromatogr.*, **184**: 335-45 (1980); Farooqi, *Enzyme*

Eng., 4: 441-2 (1978); Nishikawa, *Chem. Technol.*, 5(9): 564-71 (1975); Guilford *et al.*, in, PRACT. HIGH PERFORM. LIQ. CHROMATOGR., Simpson (ed.), 193-206 (1976); Nishikawa, *Proc. Int. Workshop Technol. Protein Sep. Improv. Blood Plasma Fractionation*, Sandberg (ed.), 422-35; (1977) "Affinity chromatography of enzymes," *Affinity Chromatogr., Proc. Int. Symp.* 25-38, (1977) (Pub. 1978); and AFFINITY CHROMATOGRAPHY: A PRACTICAL APPROACH, Dean *et al.* (ed.), IRL Press Limited, Oxford, England (1985). Those of skill in the art have ample guidance in developing particular affinity chromatographic methods utilizing the materials of the invention.

In the present method, affinity chromatographic media of varying chemical structures can be used as supports. For example, agarose gels and cross-linked agarose gels are useful as support materials, because their hydrophilicity makes them relatively free of nonspecific binding. Other useful supports include, for example, controlled-pore glass (CPG) beads, cellulose particles, polyacrylamide gel beads and Sephadex™ gel beads made from dextran and epichlorohydrin.

15

DRUG-LIGAND CONJUGATE METHODS OF USE

In addition to the compositions and constructs described above, the present invention also provides a number of methods that can be practiced utilizing the compounds and conjugates of the invention. Methods for using the drug-ligand conjugate of the current invention include: killing or inhibiting the growth or replication of a tumor cell or cancer cell, treating cancer, treating a pre-cancerous condition, killing or inhibiting the growth or replication of a cell that expresses an auto-immune antibody, treating an autoimmune disease, treating an infectious disease, preventing the multiplication of a tumor cell or cancer cell, preventing cancer, preventing the multiplication of a cell that expresses an auto-immune antibody, preventing an autoimmune disease, and preventing an infectious disease. These methods of use comprise administering to an animal such as a mammal or a human in need thereof an effective amount of a drug-ligand conjugate. Preferred ligands for many of the methods of use described herein include antibodies and antibody fragments which target the particular tumor cell, cancer cell, or other target area.

The drug-ligand complex of the current invention is useful for treating cancer, autoimmune disease and infectious disease in an animal. Compositions and methods for

treating tumors by providing a subject the composition in a pharmaceutically acceptable manner, with a pharmaceutically effective amount of a composition of the present invention are provided.

5 The current invention is particularly useful for the treatment of cancer and for the inhibition of the multiplication of a tumor cell or cancer cell in an animal. Cancer, or a precancerous condition, includes, but is not limited to, a tumor, metastasis, or any disease or disorder characterized by uncontrolled cell growth, can be treated or prevented by administration the drug-ligand complex of the current invention. The complex delivers the drug a tumor cell or cancer cell. In one embodiment, the ligand specifically binds to or
10 associates with a cancer-cell or a tumor-cell-associated antigen. Because of its close proximity to the ligand, the drug can be taken up inside a tumor cell or cancer cell through, for example, receptor-mediated endocytosis. The antigen can be attached to a tumor cell or cancer cell or can be an extracellular matrix protein associated with the tumor cell or cancer cell. Once inside the cell, the linker is hydrolytically cleaved by a tumor-cell or cancer-cell-
15 associated proteases, thereby releasing the drug. The released drug is then free to diffuse and induce cytotoxic activities. In an alternative embodiment, the drug is cleaved from the drug-ligand complex outside the tumor cell or cancer cell, and the drug subsequently penetrates the cell.

The ligand may bind to, for example, a tumor cell or cancer cell, a tumor cell
20 or cancer cell antigen which is on the surface of the tumor cell or cancer cell, or a tumor cell or cancer cell antigen which is an extracellular matrix protein associated with the tumor cell or cancer cell. The ligand can be designed specifically for a particular tumor cell or cancer cell type. Therefore, the type of tumors or cancers that can be effectively treated can be altered by the choice of ligand.

25 Representative examples of precancerous conditions that may be targeted by the drug-ligand conjugate, include, but are not limited to: metaplasia, hyperplasia, dysplasia, colorectal polyps, actinic ketatosis, actinic cheilitis, human papillomaviruses, leukoplakia, lichen planus and Bowen's disease.

30 Representative examples of cancers or tumors that may be targeted by the drug-ligand conjugate include, but are not limited to: lung cancer, colon cancer, prostate cancer, lymphoma, melanoma, breast cancer, ovarian cancer, testicular cancer, CNS cancer,

renal cancer, kidney cancer, pancreatic cancer, stomach cancer, oral cancer, nasal cancer, cervical cancer and leukemias. It will be readily apparent to the ordinarily skilled artisan that the particular targeting ligand used in the conjugate can be chosen such that it targets the drug to the tumor tissue to be treated with the drug (i.e., a targeting agent specific for a tumor-specific antigen is chosen). Examples of such targeting ligands are well known in the art, non-limiting examples of which include anti-Her2 for treatment of breast cancer, anti-CD20 for treatment of lymphoma, anti-PSMA for treatment of prostate cancer and anti-CD30 for treatment of lymphomas, including non-Hodgkin's lymphoma.

In an embodiment, the present invention provides a method of killing a cell.

The method includes administering to the cell an amount of a compound of the invention sufficient to kill said cell. In an exemplary embodiment, the compound is administered to a subject bearing the cell. In a further exemplary embodiment, the administration serves to retard or stop the growth of a tumor that includes the cell (e.g., the cell can be a tumor cell). For the administration to retard the growth, the rate of growth of the cell should be at least 10% less than the rate of growth before administration. Preferably, the rate of growth will be retarded at least 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, or completely stopped.

Effective Dosages

Pharmaceutical compositions suitable for use with the present invention include compositions wherein the active ingredient is contained in a therapeutically effective amount, i.e., in an amount effective to achieve its intended purpose. The actual amount effective for a particular application will depend, *inter alia*, on the condition being treated. Determination of an effective amount is well within the capabilities of those skilled in the art, especially in light of the detailed disclosure herein.

For any compound described herein, the therapeutically effective amount can be initially determined from cell culture assays. Target plasma concentrations will be those concentrations of active compound(s) that are capable of inhibition cell growth or division. In preferred embodiments, the cellular activity is at least 25% inhibited. Target plasma concentrations of active compound(s) that are capable of inducing at least about 50%, 75%, or even 90% or higher inhibition of cellular activity are presently preferred. The percentage of inhibition of cellular activity in the patient can be monitored to assess the appropriateness

of the plasma drug concentration achieved, and the dosage can be adjusted upwards or downwards to achieve the desired percentage of inhibition.

As is well known in the art, therapeutically effective amounts for use in humans can also be determined from animal models. For example, a dose for humans can be formulated to achieve a circulating concentration that has been found to be effective in animals. The dosage in humans can be adjusted by monitoring cellular inhibition and adjusting the dosage upwards or downwards, as described above.

A therapeutically effective dose can also be determined from human data for compounds which are known to exhibit similar pharmacological activities. The applied dose can be adjusted based on the relative bioavailability and potency of the administered compound as compared with the known compound.

Adjusting the dose to achieve maximal efficacy in humans based on the methods described above and other methods as are well-known in the art is well within the capabilities of the ordinarily skilled artisan.

In the case of local administration, the systemic circulating concentration of administered compound will not be of particular importance. In such instances, the compound is administered so as to achieve a concentration at the local area effective to achieve the intended result.

For use in the prophylaxis and/or treatment of diseases related to abnormal cellular proliferation, a circulating concentration of administered compound of about 0.001 μM to 20 μM is preferred, with about 0.01 μM to 5 μM being preferred.

Patient doses for oral administration of the compounds described herein, typically range from about 1 mg/day to about 10,000 mg/day, more typically from about 10 mg/day to about 1,000 mg/day, and most typically from about 50 mg/day to about 500 mg/day. Stated in terms of patient body weight, typical dosages range from about 0.01 to about 150 mg/kg/day, more typically from about 0.1 to about 15 mg/kg/day, and most typically from about 1 to about 10 mg/kg/day, , for example 5 mg/kg/day or 3 mg/kg/day

In at least some embodiments, patient doses that retard or inhibit tumor growth can be 1 $\mu\text{mol/kg/day}$ or less. For example, the patient doses can be 0.9, 0.6, 0.5, 0.45, 0.3, 0.2, 0.15, or 0.1 $\mu\text{mol/kg/day}$ or less (referring to moles of the drug). Preferably,

the antibody-drug conjugate retards growth of the tumor when administered in the daily dosage amount over a period of at least five days. In at least some embodiments, the tumor is a human-type tumor in a SCID mouse. As an example, the SCID mouse can be a CB17.SCID mouse (available from Taconic, Germantown, NY).

5 For other modes of administration, dosage amount and interval can be adjusted individually to provide plasma levels of the administered compound effective for the particular clinical indication being treated. For example, in one embodiment, a compound according to the invention can be administered in relatively high concentrations multiple times per day. Alternatively, it may be more desirable to administer a compound of the
10 invention at minimal effective concentrations and to use a less frequent administration regimen. This will provide a therapeutic regimen that is commensurate with the severity of the individual's disease.

 Utilizing the teachings provided herein, an effective therapeutic treatment regimen can be planned which does not cause substantial toxicity and yet is entirely effective
15 to treat the clinical symptoms demonstrated by the particular patient. This planning should involve the careful choice of active compound by considering factors such as compound potency, relative bioavailability, patient body weight, presence and severity of adverse side effects, preferred mode of administration and the toxicity profile of the selected agent.

 The compounds, compositions and methods of the present invention are
20 further illustrated by the examples that follow. These examples are offered to illustrate, but not to limit the claimed invention.

EXAMPLES

Material and Methods

In the examples below, unless otherwise stated, temperatures are given in
5 degrees Celsius ($^{\circ}\text{C}$); operations were carried out at room or ambient temperature (typically a
range of from about 18-25 $^{\circ}\text{C}$; evaporation of solvent was carried out using a rotary
evaporator under reduced pressure (typically, 4.5-30 mmHg) with a bath temperature of up to
60 $^{\circ}\text{C}$; the course of reactions was typically followed by TLC and reaction times are provided
for illustration only; melting points are uncorrected; products exhibited satisfactory $^1\text{H-NMR}$
10 and/or microanalytical data; yields are provided for illustration only; and the following
conventional abbreviations are also used: mp (melting point), L (liter(s)), mL (milliliters),
mmol (millimoles), g (grams), mg (milligrams), min (minutes), LC-MS (liquid
chromatography-mass spectrometry) and h (hours).

$^1\text{H-NMR}$ spectra were measured on a Varian Mercury 300 MHz spectrometer
15 and were consistent with the assigned structures. Chemical shifts were reported in parts per
million (ppm) downfield from tetramethylsilane. Electrospray mass spectra were recorded
on a Perkin Elmer Sciex API 365 mass spectrometer. Elemental analyses were performed by
Robertson Microlit Laboratories, Madison, NJ. Silica gel for flash chromatography was E.
Merck grade (230-400 mesh). Reverse-Phase analytical HPLC was performed on either a HP
20 1100 or a Varian ProStar 210 instrument with a Phenomenex Luna 5 μm C-18(2) 150 mm x
4.6 mm column or a Varian Microsorb-MV 0.1 μm C-18 150 mm x 4.6 mm column. A flow
rate of 1 mL/min was with either a gradient of 0% to 50% buffer B over 15 minutes or 10%
to 100% buffer B over 10 minutes with detection by UV at 254nm. Buffer A, 20 mM
ammonium formate + 20% acetonitrile or 0.1% trifluoroacetic acid in acetonitrile; buffer B,
25 20 mM ammonium formate + 80% acetonitrile or 0.1% aqueous trifluoroacetic acid. Reverse
phase preparative HPLC were performed on a Varian ProStar 215 instrument with a Waters
Delta Pak 15 μm C-18 300 mm x 7.8 mm column.

Scheme 6

1.1b Synthesis of Compound 1: *N*-[2'-(*N*'-tert-butoxycarbonyl-amino)-ethyl]-valine tert-butyl ester. To a solution of 2-(*N*'-tert-butoxycarbonyl-amino)-ethyl bromide (1 g, 4.5 mmole) and valine tert-butyl ester (0.936 g, 4.5 mmole) in DMF (10 mL) was added potassium carbonate (1.85 g, 13.5 mmole). The mixture thus obtained was stirred at 100°C

overnight. The reaction mixture was concentrated and the residue was purified by flash chromatography on silica gel with ethyl acetate/hexanes (3/7) as eluent to give the title compound as an oil (0.16 g, 12%). ¹H NMR (CDCl₃) δ 0.94 (ft, 6H), 1.44 (s, 9H), 1.473 and 1.475 (2s, 9H), 1.88 (m, 1H), 2.51 (m, 1H), 2.78 (m, 2H), 3.11 (m, 1H), 3.22 (m, 1H), 3.39 and 4.13 (2bt, 1H), 5.00 (bs, 1H) ppm; LC-MS (ESI) 205 (M+H⁺-112), 261 (M+H⁺-Bu), 317 (M+H⁺).

1.1c Synthesis of Compound 2: N-(2-Aminoethyl)-valine. The compound **1** (137 mg, 0.43 mmole) was dissolved in a solution of TFA/dichloromethane (2 mL, 1/1) at room temperature. The mixture thus obtained was stirred at room temperature for 30 min. The reaction mixture was concentrated to dryness to give the title compound as an oil (0.18 g, 95%) ¹H NMR (CD₃OD) δ 1.07 and 1.16 (2d, 6H), 2.35 (m, 1H), 3.2 (m, 1H), 3.38 (m, 4H) ppm; LC-MS (ESI) 217 (M+H⁺).

1.1d Synthesis of Compound 3. To a solution of maleamide-dPEG₄-NHS ester (61 mg, 0.16 mmole) in dichloromethane (2 mL) was added dropwise compound **2** (80.7 mg, 0.16 mmole) and diisopropylethylamine (55.5 μL, 0.32 mmole) in dichloromethane (1 mL). The mixture thus obtained was stirred overnight. The solvent were removed on the rotovap, and the residue was purified by flash chromatography on silica gel with dichloromethane, followed by 5% methanol in dichloromethane and finally 100% methanol as eluent to give the title compound as colorless oil (87 mg, 97%). ¹H NMR (CDCl₃) δ 1.08 (dd, 6H), 2.25 (m, 1H), 2.49 (t, 2H), 2.52 (t, 2H), 3.10-3.79 (m, 25H), 6.82 (s, 2H) ppm; LC-MS (ESI) 559 (M+H⁺)

1.1e Synthesis of Compound 4: Fmoc-Cit-PABOH. To a solution of Fmoc-Cit-OH (1.0 g, 2.52 mmole) and 4-aminobenzylalcohol (341 mg, 2.77 mmole) in dichloromethane (10 mL) and methanol (5 mL) was added 2-ethoxy-1-ethoxycarbonyl-1,2-dihydroquinoline[EEDQ] (1.24g, 5.04 mmole) in one portion. The mixture was stirred in the dark for 16 hours. The solvents were removed on the rotovap, and the white solid was triturated with ether (100 mL). The resulting suspension was sonicated for 5 min and then left to stand for 30 min. The white solid was collected by filtration, washed with ether and dried in vacuo (1.23g,

97%). ¹H-NMR (DMSO) δ 1.32 to 1.52 (m, 2H), 1.52 to 1.74 (dm, 2H), 2.86 to 3.06 (dm, 2H), 4.1 (M, 1H), 4.42 (d, 2H), 5.07 (t, 1H), 5.40 (bs, 2H), 5.97 (t, 1H), 7.19 to 7.95 (m, 12H), 8.10 (d, 1H), 9.97 (s, 1H) ppm; LC-MS (ESI) 503.1 (M+H⁺).

5 1.1f Synthesis of Compound 5: Fmoc-Cit-PABC-PNP. To a solution of Compound 4 (309 mg, 0.62 mmole) and p-nitrophenylchloroformate (372 mg, 1.85 mmole) in Tetrahydrofuran (30 mL) and 1-methyl-2-pyrrolidine (1 mL) was added pyridine (100 μL, 1.23 mmole) in one portion. The mixture thus obtained was stirred at room temperature for 30 minutes. The solvents were removed on the rotovap, and the residue was purified by flash chromatography
10 on silica gel with dichloromethane, followed by 3% methanol in dichloromethane and finally 10% methanol in dichloromethane as eluent to give the title compound as a white solid (97.9 mg, 70%). LC-MS (ESI) 668 (M+H⁺).

1.1g Synthesis of Compound 6: Fmoc-Lys(Boc)-PABOH. Compound 6 was prepared as
15 described above for Compound 4 in 98% yield. ¹H NMR (DMSO) δ 1.40 (s, 9H), 1.38 (m, 2H), 1.50 to 1.74 (dm, 2H), 3.04 (t, 2H), 3.30 (q, 3H), 4.19 to 4.31 (m, 2H), 4.41 (d, 2H), 4.55 (s, 2H), 7.28 to 7.68 (m, 12H), 8.00 (d, 1H) ppm; LC-MS (ESI) 574 (M+H⁺).

1.1h Synthesis of Compound 7: Fmoc-Lys(Boc)-PABC-PNP. Compound 7 was prepared as
20 described above for Compound 5 in 70% yield. ¹H NMR (CD₃Cl) δ 1.44 (s, 9H), 1.49-1.60 (m, 6H), 1.73 (m, 1H), 2.00 (m, 1H), 3.11 (m, 1H), 3.20 (bs, 1H), 4.23 (m, 2H), 4.46 (bs, 2H), 4.67 (bs, 1H), 5.56 (bs, 1H), 7.28 (m, 2H), 7.36-7.41 (m, 6H), 7.59 (m, 4H), 7.76 (d, 2H), 8.26 (dd, 2H), 8.45 (bs, 1H) ppm; LC-MS (ESI) 639 (M+H⁺-Boc), 684 (M+H⁺-Bu), 739 (M+H⁺), 778 (M+K⁺).

25 1.1i Synthesis of Compound 8: Boc-Val-Cit-OH. To a solution of Citrulline (2.54 g, 14.50 mmole) and Sodium Bicarbonate (1.28 g) in water (40 mL) was added Boc-Val-OSu (4.34 g, 13.81 mmole) dissolved in dimethoxyethane (DME). To aid the solubility of the mixture tetrahydrofuran (10 mL) was added. The mixture thus obtained was let stir overnight at room
30 temperature. Aqueous citric acid (15%, 75 mL) was added and the mixture was extracted

with 10% 2-propanol/ethyl acetate (2 x 100 mL). The organic layer was washed with brine (2 x 150 mL) and the solvents were removed on the rotovap. The resulting white solid was dried in vacuo for 5 hours and then treated with ether (100 mL). After brief sonication and trituration, the white solid product was collected by filtration (1.39 g, 27%). ¹H NMR (CD₃OD) δ 0.91 (dd, 3H), 0.98 (dd, 3H), 1.44 (s, 9H), 1.70 (m, 2H), 1.87 (m, 2H), 2.02 (m, 2H), 3.11 (t, 2H), 3.89 (t, 1H), 4.39 (q, 1H), 8.22 (d, 1H) ppm; LC-MS (ESI) 375 (M+H⁺).

1.1j Synthesis of Compound 9: Boc-Val-Cit-PABOH. Compound **9** was prepared as described above for Compound **4** in 71% yield. ¹H NMR (CD₃OD) δ 0.93 and 0.97 (2d, 6H), 1.44 (s, 9H), 1.58 (m, 2H), 1.75 (m, 1H), 1.90 (m, 1H), 2.05 (m, 1H), 3.10 (m, 1H), 3.19 (m, 1H), 3.91 (d, 1H), 4.52 (m, 1H), 5.25 (s, 2H), 7.40 (d, 2H), 7.45 (dd, 2H), 7.64 (d, 4H), 8.29 (dd, 2H) ppm; LC-MS (ESI) 480 (M+H⁺).

1.1k Synthesis of Compound 10: Boc-Val-Cit-PABC-PNP. A solution of Boc-Val-Cit-PABOH (178 mg, 0.370 mmole) in THF (8 mL) in CH₂Cl₂ (4 mL) was stirred at room temperature with PNP chloroformate (160 mg, 0.80 mmole) and pyridine (65 μL, 0.80 mmole) for 3 h. Ethyl acetate (100 mL) and 10% aqueous citric acid (50 mL) were added to the reaction mixture and organic layer was washed with brine, dried and concentrated and the residue was purified by flash chromatography on silica gel with 5% methanol in as eluent to give the title compound as a white solid (165 mg, 70%). ¹H NMR (CD₃OD) δ 0.93 (dd, 3H), 0.97 (dd, 3H), 1.44 (s, 9H), 1.58 (m, 2H), 1.75 (m, 1H), 1.89 (m, 1H), 2.05 (m, 1H), 3.10 (m, 1H), 3.20 (m, 1H), 3.90 (d, 1H), 4.51 (m, 1H), 4.55 (s, 2H), 7.29 (d, 2H), 7.55 (d, 2H) ppm; LC-MS (ESI) 545 (M + H⁺ - Boc), 645 (M + H⁺), 667 (M + Na⁺), 683 (M + K⁺).

1.1l Synthesis of Compound 12a. To a suspension of Compound **11** (20 mg, 0.078 mmole) in ethyl acetate (5 mL) was bubbled HCl gas for 20 min (by the time, the suspension became to a clean solution). The reaction mixture was stirred for additional 5 min then the mixture was concentrated to dryness to give the title compound as yellow solid (26 mg, 100%) which was used in next step without further purification. LC-MS (ESI) 260 (M + H⁺ - Cl), 295 (M + H⁺).

1.1m Synthesis of Compound 12b. To a suspension of Compound **11** (20 mg, 0.078 mmole) in ethyl acetate (5 mL) was bubbled HBr gas for 20 min (by the time, the suspension became to a clean solution). The reaction mixture was stirred for additional 5 min then the mixture was concentrated to dryness to give the title compound as yellow solid (33 mg, 100%) which was used in next step without further purification. LC-MS (ESI) 260 ($M + H^+ - Br$), 339 ($M + H^+$), 341 ($M + H^+ + 2$).

1.1n Synthesis of Compound 13b. To a solution of Compound **12a** (26 mg, 0.078 mmole) in DMF (2 mL) were added 5-(2-dimethylamino-ethoxy)-benzofuran-2-carboxylic acid (44 mg, 0.155 mmole) and EDC (30 mg, 0.155 mmole). The mixture thus obtained was stirred at room temperature for 2 h. The mixture was concentrated and the residue was dissolved in $H_2O/CH_3CN/TFA$ (4/1.5/0.5, 6 mL) and it was placed in freezer for 3 h. A yellow solid was collected by filtration (35 mg, 85%). 1H NMR (CD_3OD) δ 2.67 (s, 3H), 3.01 (s, 6H), 3.34 (m, 2H), 3.63 (ft, 1H), 3.89 (s, 3H), 3.91 (m, 1H), 4.41 (m, 3H), 4.54 (m, 1H), 4.65 (m, 1H), 7.20 (dd, 1H), 7.36 (d, 1H), 7.54 (s, 1H), 7.59 (d, 1H), 7.73 (bs, 1H), 11.75 (s, 1H) ppm; LC-MS (ESI) 490 ($M + H^+ - Cl$), 526 ($M + H^+$).

1.1o Synthesis of Compound 13c. To a solution of Compound **12b** (19 mg, 0.0387) in DMF (2 mL) were added 5-(2-dimethylamino-ethoxy)-benzofuran-2-carboxylic acid HBr salt (25 mg, 0.0775 mmole) and PS-carbodiimide (82 mg, mmole/g: 0.94, 0.0775 mmole). The reaction mixture was stirred at room temperature for 24 h. After filtration, the filtrate was concentrated and the residue was dissolved in $H_2O/CH_3CN/TFA$ (2/0.75/0.25, 3 mL) and it was placed in freezer for 3 h. The yellow solid was collected by filtration and dried to give the title compound (18 mg, 82%). LC-MS (ESI) 490 ($M + H^+ - Br$), 570 ($M + H^+$), 572 ($M + H^+ + 2$).

1.1p Synthesis of Compound 14a. To a suspension of Compound **13a** (48 mg, 0.10 mmole) in dichloromethane (4 mL) were added *p*-nitrophenyl chloroformate (80 mg, 0.40 mmole) and triethylamine (56 μ L, 0.40 mmole) at $-78^\circ C$. The mixture was warmed up to room temperature slowly and the stirring was continued for additional 30 min. To the reaction

mixture was added compound *N*-Boc-*N,N'*-dimethylethylenediamine (166 mg, 0.80 mmole) and stirred overnight. The mixture was concentrated and the residue was purified by flash chromatography on silica gel with 1.25% methanol in dichloromethane as eluent to give the title compound as a white solid (71 mg, 100%) ¹H NMR δ 1.45-1.47 (m, 9H), 2.69 (s, 3H), 2.97 (s, 3H), 3.14-3.34 (m, 4H), 3.81-3.92 (m, 8H), 4.38-4.47 (m, 3H), 4.70 (d, 1H), 7.05 (dd, 1H), 7.11 (d, 1H), 7.45 (s, 1H), 7.48 (d, 1H), 7.99 (s, 1H), 10.43 (s, 1H) ppm. LC-MS (ESI) 710 (M-H⁺)

1.1q Synthesis of Compound 14b. To a suspension of Compound **13b** (48 mg, 0.075

mmole) in dichloromethane (2 mL) were added 4-nitrophenyl chloroformate (80 mg, 0.4 mmole) and triethylamine (40 mg, 0.4 mmole, 56 μL) at 0 °C. The mixture was warmed up to room temperature and stirring was continued additional 6 h. The solvent was evaporated and the residue was washed with ether to give the intermediate. The intermediate was dissolved in dichloromethane (2 mL) and to the reaction solution were added *N*-Boc-*N,N'*-

dimethylethylenediamine (44 mg, 0.2 mmole) and triethylamine (20 mg, 0.2 mmole, 28 μL). The mixture thus obtained was stirred at room temperature overnight. The mixture was concentrated and the residue was purified by HPLC on C-18 column with ammonium formate (20 mM, pH 7.0) and acetonitrile as eluent to give the title compound as white solid (31 mg, 54%). LC-MS (ESI) 755 (M+H⁺)

1.1r Synthesis of Compound 14c. To a suspension of Compound **13c** (24 mg, 0.04 mmole)

in CH₂Cl₂ (2 mL) were added *p*-nitrophenyl chloroformate (64 mg, 0.32 mmole) and triethylamine (22 μL, 0.16 mmole) at 0 °C. The reaction mixture thus obtained was stirred at room temperature for 18 h. To the reaction mixture was added *N*-Boc-*N,N'*-

dimethylethylenediamine (94 mg, 0.50 mmole) and the stirring was continued for additional 50 min. The reaction mixture was concentrated and the residue was purified by flash chromatography on silica gel with 5% methanol in dichloromethane as eluent to give the title compound as white solid (28 mg, 83%). LC-MS (ESI) 490, 570, 684 (M + H⁺ - Boc), 784 (M + H⁺), 805 (M + Na⁺), 722 (M + K⁺)

1.1s Synthesis of Compound 15a. Compound **14a** (70 mg, 0.10 m mole) was dissolved in trifluoroacetic acid (5 mL) and the mixture was stirred at room temperature for 30 min and concentrated to dryness and the product (72 mg, 100%) was used in next step without further purification. HPLC showed it to be >95% pure. ¹H NMR δ 2.64 (s, 3H), 2.93 (s, 3H), 3.19 (s, 3H), 3.30 (t, 1H), 3.79 (s, 3H), 3.85 (s, 3H), 3.81-3.85 (m, 1H), 4.27-4.49 (m, 3H), 4.59 (d, 1H), 4.68 (d, 1H), 6.97 (dd, 1H), 7.03 (d, 1H), 7.38 (s, 1H), 7.41 (d, 1H), 8.00 (br s, 1H), 10.61 (br s, 1H) ppm. LC-MS (ESI) 612 (M+H⁺), 634 (M+Na⁺)

1.1t Synthesis of Compound 15b. Compound **15b** was prepared as described above for Compound 15a in 100% yield. ¹H NMR (CD₃OD) δ 2.69 (s, 3H), 2.76 (s, 3H), 2.83 (bs, 1H), 3.01 (s, 6H), 3.08 (bs, 1H), 3.24 (bs, 2H), 3.42 (m, 2H), 3.63 (bs, 3H), 3.74 (bs, 1H), 3.91 (s, 3H), 3.92 (m, 1H), 4.40 (bs, 2H), 4.57 (bs, 2H), 4.71 (bs, 1H), 7.22 (bd, 1H), 7.36 (s, 1H), 7.56 (s, 1H), 7.59 (d, 1H), 8.04 (bs, 1H) ppm; LC-MS (ESI) 490, 526, 640 (M+H⁺), 678 (M+K⁺).

1.1u Synthesis of Compound 15c. Compound **15c** was prepared as described above for Compound **15a** in 100% yield. LC-MS (ESI) 490, 570, 684 (M + H⁺), 722 (M + K⁺)

1.1v Synthesis of Compound 16a. To a solution of Compound **5** (12.5 mg, 0.019 mmole) and Compound **15a** (10 mg, 0.014) in dimethylformamide (200 μ L) was added triethylamine (6 μ L, 0.044 mmole). The mixture thus obtained was stirred at room temperature overnight. Ether (5 mL) was added to the mixture and a white solid precipitated out of solution. The solid was filtered and purified by flash chromatography on silica gel with dichloromethane, followed by 1% methanol in dichloromethane, 2% methanol in dichloromethane, 3% methanol in dichloromethane and finally 4% methanol in dichloromethane as eluent to give the title compound as a white solid (8.7 mg, 56%). LC-MS (ESI) 470, 1112 (M+H⁺), 1134 (M + Na⁺), 1150 (M + K⁺)

1.1w Synthesis of Compound 16b. To a solution of Compound **15b** (5 mg, 0.0056 mmole) in DMF (0.35 mL) were added Compound **5** (3.8 mg, 0.0056 mmole) and DIEA (2 μ L, 0.011

mmole). The mixture thus obtained was stirred at room temperature for 5 h. The mixture was concentrated and the residue was purified by flash chromatography on silica gel with 10% methanol in dichloromethane as eluent to give the title compound as a solid (3 mg, 45%). LC-MS (ESI) 490, 526, 1169 ($M + H^+$), 1208 ($M + K^+$)

5

1.1x Synthesis of Compound 16c. Compound **16c** was prepared as described above for Compound **16b** in 50% yield. LC-MS (ESI) 490, 570, 1212 ($M + H^+$), 1250 ($M + K^+$)

10

1.1y Synthesis of Compound 17a. To a solution of Compound **16a** (8.7 mg, 0.008 mmole) in dimethylformamide (500 μ L) was added piperidine (100 μ L) in one portion. The mixture thus obtained was stirred for 20 minutes at room temperature. The solvent were removed on the rotovap, and placed on the high vacuum for 1.5 h. The residue was take up in the minimal amount of dichloromethane (100 μ L) and hexane (3 mL) was add to the solution, a white solid crashed out of solution which was filtered off and dried (6.7 mg, 96.7%). MS (ES) 470, 890.1 ($M+H^+$), 912 ($M + Na^+$), 928 ($M + K^+$).

15

1.1z Synthesis of Compound 17b. Compound **17b** was prepared as described above for Compound **17a** in 95% yield. LC-MS (ESI) 947 ($M + H^+$)

20

1.1aa Synthesis of Compound 17c. Compound **17c** was prepared as described above for Compound **17a** in 95% yield. LC-MS (ESI) 1015 ($M + H^+$)

25

1.1bb Synthesis of Compound 18a. To a solution of Compound **17a** (4.2 mg, 0.005 mmole) and Compound **3** (2.64 mg, 0.005 mmole) in dichloromethane (1 mL) was added in one portion PyBOP (3.7 mg, 0.007 mmole) followed by diisopropylethylamine (1 μ L). The mixture thus obtained was stirred overnight at room temperature. The solvents were removed on the rotovap. The residue was purified by Prep HPLC to yield a beige solid (2.6 mg, 38.7%). MS (ES) 470, 1431 ($M + H^+$), 1453 ($M + Na^+$), 1469 ($M + K^+$)

1.1cc Synthesis of Compound 18b. To a solution of Compound **17b** (2.2 mg, 0.0025 mmole) and Compound **3** in 5% methanol in dichloromethane (400 μ L) were added HBTU (9 mg, 0.0046 mmole) and DIEA (1.4 μ L, 0.0046 mmole). The mixture thus obtained was stirred at room temperature overnight. The solvent was evaporated and the residue was purified on semi-preparative HPLC with 10 mM ammonium formate and acetonitrile as eluent to give the title compound as an oil (1.1 mg, 30%). LC-MS (ESI) 490, 526, 1488 (M + H⁺), 1527 (M + K⁺)

1.1dd Synthesis of Compound 18c. To a solution of Compound **17c** (6.5 mg, 0.0065 mmole) and the Compound **3** (5.5 mg, 0.0097 mmole) in 5% methanol in dichloromethane (0.5 mL) were added HBTU (3.7 mg, 0.0097 mmole) and DIEA (3.4 μ L, 0.0194 m mole). The mixture thus obtained was stirred at room temperature overnight. The solvent was evaporated and the residue was purified by flash chromatography on silica gel with 30 % methanol in dichloromethane as eluent to give the title compound as an oil (4 mg, 30%). LC-MS (ESI) 1532 (M+H⁺), 1554 (M+Na⁺), 1570 (M+K⁺).

1.2 Synthesis methodology for duocarmycin-containing peptide linker without self-immolative spacer

1.2a Reaction A: To a suspension of Alkylating core 7 mg in 2mL of Ethyl Acetate was
 5 passed a slow stream of dry HBr gas until a clear solution is formed which took
 approximately 15 minutes. The reaction mixture was concentrated and dried overnight under
 high vacuum.

1.2b Reaction B: To a suspension of the bromo methyl seco compound prepared in step A
 10 in DMF was added EDC (10mg, 0.054mMoles) and 5-Nitro benzofuran carboxylic acid
 (12mg, 0.054 mMoles) and allowed to stir for 6 hours. To this reaction mixture was then
 added ethyl acetate and brine. The combined organic layers were concentrated after three
 extractions with ethyl acetate. And filterd over silica gel using MeOH/DCM with increasing
 amounts of MeOH The product was confirmed by Mass Spec, M+1 = 530

15

5
1.2c Reaction C: The 4'-OH was protected using methyl piperazine carbonyl chloride (11 mg, 0.054 mMoles) in 2mL DCM, 200 μ L Allyl alcohol and pyridine (21 μ L) for 2 hours. The product was purified by silica gel column chromatography and Identified by Mass Spec, MS+1 = 654

10
1.2d Reaction D: Reduction of Nitro group was done by hydrogenolysis over Pd/C in DCM/MeOH (2:1) under 40 PSI for 45 minutes. The product was filtered and the filtrate concentrated and dried under high vacuum. The product was confirmed by mass spec analysis MS+1 = and carried out to the next step without further purification.

15
1.2e Reaction E: To a solution of above compound (18mg, 0.024 mMoles) in MeOH/DCM (2:1, 3 mL) was added Fmoc-Val-Citruline (29 mg, 0.06 mMoles) the resultant mixture was stirred for 10 minutes until all the acid dissolved. 15 mg, 0.06 moles of EEDQ was added and the reaction mixture was stirred in the dark overnight. The reaction mixture was then concentrated, rinsed with diethyl ether and the residue was purified by reverse phase Prep HPLC to give the product which was identified by Mass Spec M+1 = 1103.

20
1.2f Reaction F: Deprotection of Fmoc protecting group was done using 5% piperidine in 1 mL DMF for 10 minutes. Concentration of the reaction mixture was followed by rinsing the solid residue with diethyl ether. Product was confirmed by Mass Spec, MS+1 = 880 and M+K= 919

25
1.2g Reaction G: To a solution of the free amine in DMF (1.5 mL) prepared in step F was added Mal-(PEG)₄-NHS-ester (20 mg) and the reaction mixture stirred for 1 hr. Concentration followed by purification reverse phase Prep HPLC gave 2.8 mg of (11 % overall yield, beginning from Alkylating core) which was confirmed by mass spec MS+1 = 2178, M+Na = 1300 and M+K = 1316

30
1.3 Synthesis of Peptide Linker conjugated with Tubulysine A

The ligand can be linked to PEG and peptide linker by the synthesis shown.

5 1.4b Synthesis of peptide-linker conjugate 112

2.1a Synthesis Scheme for Compound 109

10

2.1b Synthesis of Compound 110

To a suspension of Cbz-dimethyl alanine (1g, 3.98 mMoles) in 30 mL of DCM at ice-
 15 bath temperature was added HOAT (catalytic, 0.25 equivalents), DIPEA (2.8 mL, 16

mmoles) followed by 2-chloro-1,3-dimethylimidazolidinium hexafluorophosphate (CIP) (1.2 g, 4.4 mmoles). To this reaction mixture was then added Boc-NN(Me) (643 moles, 4.4 mmoles). The reaction mixture was allowed to stir overnight at room temperature. To the reaction mixture is added 10 % citric acid solution (100 mL) and extracted with DCM. The
5 organic phase was washed with water and then with a saturated solution of sodiumbicarbonate followed by water again. The organic phase was then concentrated and purified by silica gel column with increasing polarity of ethyl acetate in hexanes to give 860 mg, 57 % yield 107 which identified by mass spec $M+1 = 380$ and $M+NH_4^+ = 397$.

The Cbz protecting group was removed by catalytic hydrogenation using Pd/C in
10 MeOH to give compound 108 which was confirmed by MS.

To a solution of PNPC-1918 (10 mg, 0.1 mmoles) in 2 mL DCM was added drop wise a solution of Compound 108 (60 mg, 0.25 mmoles) in 8mL of DCM and the reaction mixture was allowed to stir for 2 days till all the starting material had disappeared. The reaction mixture was filtered through a short silica gel pad and then concentrated and purified
15 by reverse phase Prep HPLC to give 4.2 mg of Compound 109. This was identified by Mass Spec $M+1 = 740$. Boc Deprotection of Compound 109 was done with pure TFA for 20 minutes to give Compound 110. The product was identified by Mass Spec, $M+1 = 640$.

2.1c Synthesis of Compound 111

5 The Mal-PEG₄-Acetophenone and compound 110 (3mg, .005 mmoles) were combined concentrated and dried overnight under high vacuum. To this mixture was added a 1 mL of 5 % acetic acid solution prepared a day earlier and dried over molecular sieves. The formation of hydrazone was complete in less then an hour. After which the reaction mixture was concentration and purified by reverse phase Prep HPLC (ammonium formate *Ph* = 7) to

10 give 2.8 mg of compound 111 (60 % yield). The product was identified by Mass Spec, MS+1 = 1129, M+ NH₄ = 1146 and M+K = 1168

2.2 Synthesis of a *gem*-dimethyl 6-membered hydrazine linker conjugated to a tubulysin cytotoxin

15

Similar methodology as shown in Example 2.1 can be applied for the synthesis of a
 5 geminal dimethyl 6-membered hydrazine linker complexed with a drug such as tubulysin A
 is shown.

2.3 Synthesis of a hydrazine linker conjugated to a duocarmycin analog

To a solution of the bromo methyl seco compound (0.074 mMoles) in 3 mL DMF was added the 5-acetyl indole-2-carboxylate (30 mg, 0.15 mMoles) and EDC (28 mg, 0.15 mMoles) and the resulting mixture was stirred overnight. The reaction mixture was concentrated and purified by silica gel chromatography using 5% MeOH in DCM Tt give 29 mg (74 % yield) of product which was confirmed by mass spec $M+1 = 523$.

To a solution of the compound synthesized in step C in 5 mL DCM and 300 μ L allyl alcohol was added methyl piperazine carbonyl chloride (22 mg, 0.11 m Moles) and pyridine 44 μ L. The reaction mixture was stirred at room temperature for 5 hours. Concentration followed by purification by silica gel chromatography using 5 % MeOH/DCM as eluant gave 48 mg of the desired product (73 % yield). The product was confirmed by Mass Spec. $M+1 = 650$.

A solution of the above compound (8.2 mg , 0.012 mmoles) and Mal-PEG₄-hydrazine in 5 % acetic acid in anhydrous DCM was stirred at room temperature for 20 minutes followed by evaporation of Solvents and Reverse phase Prep HPLC using acetonitrile and ammonium formate buffered aqueous phase gave 2.5 mg of the desired final product which was confirmed by mass Spec, $M+1 = 1063$

2.4a Rate of cyclization of a dimethyl 6-membered hydrazine linker

A duocarmycin analog conjugated to a dimethyl 6-membered hydrazine linker was incubated in buffer at pH 7.4 for 24 hours and the generation of cyclized product resulting from cyclization of the hydrazine linker, thereby releasing free duocarmycin analog, was assessed over time.

10

Minimal amounts of cyclized product were detected over 24 hours at pH=7.4, indicating this form of 6-membered hydrazine linker exhibits a relatively slow rate of cyclization.

15 2.4b Rate of cyclization of a *gem*-dimethyl 6-membered hydrazine linker

A duocarmycin analog conjugated to a *gem*-dimethyl 6-membered hydrazine linker was incubated in buffer at pH 7.4 and the generation of cyclized product resulting from cyclization of the hydrazine linker, thereby releasing free duocarmycin analog, was assessed over time.

With the 6-membered *gem*-dimethyl linker, the cyclization reaction was quite rapid, proceeding to completion within a few minutes. Thus, the rate of cyclization for the *gem*-dimethyl 6-membered hydrazine linker proceeded at a much faster rate than that of the 6-membered linker that did not contain the *gem*-dimethyl moiety.

EXAMPLE 3: Synthesis of 5-Membered Hydrazine Linker Conjugates

3.1 Synthesis Methodology for Compound 4

10

15

Cbz-DMDA-2,2-Dimethylmalonic acid (1)

To a solution of 2,2-Dimethyl-malonic acid (2.0 gm, 0.0151 moles), Thionyl chloride (1.35 ml, 0.0182 moles) in THF (15 ml) in a 25 mL flask equipped with a stir bar, temperature probe, and reflux condenser was added a drop of DMF and the reaction mixture was heated to reflux for 2 hrs then cooled to room temperature. This reaction mixture was transferred to drop wise to a solution of Cbz-DMDA (4 gm, 0.0182 moles) and triethylamine (4 ml, 0.0287 moles) in THF (5 ml) at 0 C and was stirred for 30 min at this temperature. The solvent was removed in vacuo and the residue dissolved in 1N HCl (50 ml) and extracted with DCM (2 x 25 ml). The combined organic layers were extracted with 1N NaOH (2 x 25 ml) and the combined aqueous layer were acidified (pH<1) with conc. HCl and extracted with EtOAc (2 x 25 ml), dried over MgSO₄, filtered and concentrated in vacuo to an off-white sticky solid, 3.44 gm, 68% yield. Compound 1 was confirmed by mass spec: m/z 337.0 [M + 1]⁺
HPLC retention time: 3.77 min (mass spec)

15 Cbz-DMDA-2,2-Dimethylmalonic- Boc -N⁷-methylhydrazine (2)

To a solution of Compound 1 (3.0 gm, 0.0089 moles), Thionyl chloride (0.78 ml, 0.0107 moles) in THF (25 ml) in a 50ml 3N RBF equipped with a stir bar, temperature probe, and reflux condenser was added a drop of DMF and the reaction mixture was refluxed for 2 hrs then cooled to room temperature. This reaction mixture was then added dropwise to a solution of Boc-N-methyl hydrazine (1.33 gm, 0.091 moles) and triethylamine (3 ml, 0.0215 moles) in THF (25 ml) at 0 C and stirred for 30 min. The solvent was removed in vacuo and the residue dissolved in EtOAc(50 ml), dried over MgSO₄, filtered and concentrated in vacuo to a brown oil. The oil was dissolved in EtOAc and purified by column chromatography (100 % EtOAc) resulting in 3.45 gm, 83% yield of a clear oil. Compound 2 was confirmed by mass spec: m/z 465.2 [M + 1]
HPLC retention time: 3.97 min (mass spec)

30 DMDA-2,2-Dimethylmalonic- Boc N⁷-methylhydrazine (3)

To a solution of Compound 2 (0.5 gm, 0.0011 moles) in MeOH (30 ml) was added 10% Pd/C (15 mg) and the reaction placed on a Parr hydrogenator for 30 minutes. The catalyst was filtered off and filtrate concentrated in vacuo to a clear oil to yield Compound 3

(0.38 gm). Product was confirmed by NMR (^1H , CDCl_3): δ 1.45 (s, 15H) 2.45 (s, 3H) 2.85 (s, 6H), 3.16 (s, 3H) 4.64 (m, 1H) 10.6 (bs, 1H); NMR (^{13}C , CDCl_3) δ 24.1, 28.57, 35.15, 35.58, 36.66, 47.01, 48.51, 81.11, 155.17, 173.56, 176.24

5

10 Synthesis of Compound 4

To a 15 ml RBF equipped with a stir bar, was combined Compound 3 (50 mg, 0.1513 mmoles), PNPC-1918 (20 mg, 0.0315 mmoles) and DCM (5 ml). The solution was stirred for 30 minutes, then triethylamine (25 μL , 0.1794 mmoles) was added and the bright yellow solution was stirred for 1 hr. The solution was concentrated in vacuo to a yellow oil and purified by column chromatography (100% DCM to 1:1 EtOAc/DCM) to yield Compound 4 as an off-white solid, 22 mg, (84%). Product was confirmed by mass spec: m/z 825.7 [$\text{M} + 1$] $^+$

15

HPLC retention time: 7.65 min (mass spec)

20

3.2 Synthesis of an antibody-drug conjugate having a 5-membered hydrazine linker

This scheme demonstrates the conjugation of an antibody to a linker-drug complex.

- 5 These methodologies are well known in the pharmaceutical art. Examples of other reactive sites includes maleimides, haloacetamides with thiols on a ligand, thiols that react with disulfides on a ligand, hydrazides that react with aldehydes and ketones on a ligand, and hydroxysuccinimides, isocyanates, isothiocyanates, and anhydride that react with amino group on a ligand.

10

EXAMPLE 4: Synthesis of Disulfide Membered Linker Conjugates

Scheme 1

Scheme 2

Scheme 3

4.1a Synthesis of Compound 1. To a flask containing PEG₄ (3.88 g, 20 mmole) was added triton B (40% solution in methanol, 1.08 mL, 0.25 mmole) and *tert*-butyl acrylate (3.62 mL, 24 mmole) followed after 15 min. The mixture was stirred at room temperature overnight.

5 The mixture was concentrated *in vacuo* and the residue was purified by flash chromatography on silica gel with 1 % methanol in dichloromethane as eluent to give the title compound as a colorless oil (2.35 g, 36%). ¹H NMR δ 1.45 (s, 9H), 2.5 (t, 2H), 3.65 (m, 18H).

10 4.1b Synthesis of Compound 2. To a solution of Compound 1 (1.17 g, 3.6 mmole) in dichloromethane (10 mL) were added triethylamine (532 μL, 4 mmole) and methanesulfonyl chloride (309 μL, 4 mmole). The mixture thus obtained was stirred at room temperature overnight. The solvent was evaporated and the residue was purified by flash chromatography on silica gel with 1 % methanol in dichloromethane as eluent to give the title compound as an
15 yellow oil (1.3 g, 89%). ¹H NMR δ 1.43 (s, 9H), 2.48 (t, 2H), 3.07 (s, 3H), 3.62-3.70 (m, 14H), 3.76 (m, 2H), 4.37 (m, 2H).

4.1c Synthesis of Compound 3. To a solution of Compound 2 (1.3 g, 3.25 mmole) in ethanol (10 mL) was added sodium azide (423 mg, 6.5 mmole). The mixture thus obtained
20 was refluxed overnight. The solvent was evaporated and the residue was purified by flash chromatography on silica gel with 1 % methanol in dichloromethane as eluent to give the title compound as a yellow oil (1.01 g, 90%). ¹H NMR δ 1.45 (s, 9H), 2.50 (t, 2H), 3.40 (t, 2H), 3.62-3.73 (m, 16H).

25 4.1d Synthesis of Compound 4. To a solution of Compound 3 (470 mg, 1.35 mmol) in ether (5 mL) containing H₂O (25 μL) was added triphenylphosphine (391 mg, 1.48 mmole). The mixture thus obtained was stirred at room temperature overnight. The solvent was evaporated and the residue was purified by flash chromatography on silica gel with 1 % methanol in dichloromethane as eluent to give the title compound as a yellow oil (325 mg,

75%). $^1\text{H NMR } \delta$ 1.45 (s, 9H), 2.24 (bs, 2H), 2.51 (t, 2H), 2.91 (t, 2H), 3.56 (m, 2H), 3.63-3.66 (m, 12H). 3.72 (m, 2H).

4.1e Synthesis of Compound 5. To a solution of 3-mercaptopropionic acid (1.22 g, 11.5 mmole) in methanol (10 mL) was added aldrithiol-2 (3.78 g, 17.25 mmole). The mixture thus obtained was stirred at room temperature for 3 hours. The solvent was evaporated and the residue was purified by flash chromatography on silica gel with 30 % ethyl acetate in hexanes as eluent to give the title compound as an oil (2.44 g, 98%). $^1\text{H NMR } \delta$ 2.8 (t, 2H), 3.05 (t, 2H), 7.14 (m, 1H), 7.67 (m, 2H), 8.48 (m, 1H).

10 Compound **5b**: $^1\text{H NMR } \delta$ 1.43 (d, 3H), 2.61 (m, 1H), 2.76 (m, 1H), 3.40 (m, 1H), 7.17 (m, 1H), 7.66 (m, 2H), 8.45 (m, 1H).

4.1f Synthesis of Compound 6. 3-Methyl benzothiazolium iodide (1g, 3.6 mmole) was dissolved in 2 N sodium hydroxide aqueous solution (10 mL) and the mixture was stirred for 15 6 hours at 100 °C then acidified with 6 N hydrochloric acid aqueous solution to pH 4 and extracted with diethyl ether. The organic layer was dried over Na_2SO_4 , rotary evaporated *in vacuo* and the residue was dissolved in methanol (10 mL) and compound 5a (776 mg, 3.6 mmole) was added. The mixture was stirred at room temperature for 1 hour. The mixture was concentrated to dryness and the residue was purified by flash chromatography on silica gel with 1% methanol in dichloromethane as eluent to give the title compound as a yellow oil (482 mg, 55%). $^1\text{H NMR } \delta$ 2.85 (m, 2H), 2.95 (m, 5H), 6.64 (m, 2H), 7.3 (m, 1H), 7.4 (dd, 1H); MS (ES) 244 ($\text{M}+\text{H}^+$), 487 ($2\text{M}+\text{H}^+$).

25 Compound **6b**: $^1\text{H NMR } \delta$ 1.35 (d, 3H), 2.48 (m, 1H), 2.92 (s, 3H), 3.02 (m, 1H), 3.34 (m, 1H), 6.62 (m, 2H), 7.28 (m, 1H), 7.44 (m, 1H); MS (ES) 258 ($\text{M}+\text{H}^+$).

Compound **6c**: $^1\text{H NMR } \delta$ 1.45 (s, 6H), 2.70 (s, 2H), 2.93 (s, 3H), 6.62 (m, 2H), 7.24 (m, 1H), 7.51 (m, 1H); MS (ES) 272 ($\text{M}+\text{H}^+$), 294 ($\text{M}+\text{Na}^+$), 310 ($\text{M}+\text{K}^+$).

4.1g Synthesis of Compound 7. To a solution of Compound **6a** (28 mg, 0.115 mmole) in anhydrous methanol (1 mL) was added acetyl chloride (13 μL , 0.173 mmole). The mixture thus obtained was stirred at room temperature overnight. The solvent was evaporated and the

residue was purified by flash chromatography on silica gel with 10 % ethyl acetate in hexanes as eluent to give the title compound as an oil (24 mg, 83%). $^1\text{H NMR } \delta$ 2.08 (m, 2H), 2.93 (s, 3H), 2.95 (m, 2H), 3.70 (s, 3H), 6.63 (m, 2H), 7.28 (m, 2H), 7.40 (m, 2H); MS (ES) 258 ($\text{M}+\text{H}^+$), 280 ($\text{M}+\text{Na}^+$), 296 ($\text{M}+\text{K}^+$).

5 Compound **7b**: $^1\text{H NMR } \delta$ 1.32 (d, 3H), 2.45 (m, 1H), 2.92 (s, 3H), 2.93 (m, 1H), 3.35 (m, 1H), 3.67 (s, 3H), 6.62 (m, 2H), 7.26 (m, 1H), 7.44 (m, 1H); MS (ES) 272 ($\text{M}+\text{H}^+$).

 Compound **7c**: $^1\text{H NMR } \delta$ 1.42 (s, 6H), 2.66 (s, 2H), 2.93 (s, 3H), 3.62 (s, 3H), 6.62 (m, 2H), 7.24 (m, 1H), 7.51 (m, 1H); MS (ES) 286 ($\text{M}+\text{H}^+$), 308 ($\text{M}+\text{Na}^+$), 324
10 ($\text{M}+\text{K}^+$).

4.1h Synthesis of Compound 8. To a solution of Compound **7a** (24 mg, 0.093 mmole) in dichloromethane (1 mL) were added triphosgene (28 mg, 0.093 mmole) and triethylamine (37 μL , 0.28 mmole) at 0°C . The mixture was stirred for 1 hour. The mixture was
15 concentrated to dryness and the residue was used in next step without further purification.

The crude material was dissolved in dichloromethane (1 mL) and the Compound **8a** (35 mg, 0.074 mmole), and DMAP (23 mg, 0.190 mmole) were added. The mixture thus obtained was stirred at room temperature for overnight. The solvent was evaporated and the residue was purified by flash chromatography on silica gel with 1 % methanol in
20 dichloromethane as eluent to give the title compound as an yellow oil (53 mg, 76%). $^1\text{H NMR } \delta$ 2.70 (s, 3H), 2.74 (m, 2H), 3.06 (m, 2H), 3.34 (m, 1H), 3.35 and 3.36 (2s, 3H), 3.63 and 3.64 (2s, 3H), 3.86 (m, 1H), 3.88 (s, 3H), 3.93 and 3.94 (2s, 3H), 4.48 (m, 1H), 4.55 (m, 1H), 4.79 (m, 1H), 7.05 (m, 1H), 7.11 (m, 1H), 7.26-7.52 (m, 5H), 7.85 (d, 1H), 8.1 (bs, 1H), 8.98 and 9.08 (2s, 1H); MS (ES) 753 ($\text{M}+\text{H}^+$).

25 Compound **8b**: $^1\text{H NMR } \delta$ 1.38 (m, 3H), 2.52 (m, 1H), 2.69 (m, 3H), 2.79 (m, 1H), 3.33 (m, 1H), 3.37 (2s, 3H), 3.64 (m, 3H), 3.88 (s, 3H), 3.84-3.90 (m, 1H), 3.93 (2s, 3H), 4.48 (m, 1H), 4.57 (m, 1H), 4.78 (m, 1H), 7.06 (m, 1H), 7.12 (m, 1H), 7.26-7.43 (m, 3H), 7.50 (m, 2H), 7.86 (m, 1H), 8.1 (bs, 1H), 8.99, 9.08, 9.13 and 9.22 (4s, 1H); MS (ES) 767 ($\text{M}+\text{H}^+$).

Compound **8c**: $^1\text{H NMR } \delta$ 1.44 (m, 6H), 2.63 (d, 2H), 2.70 (s, 3H), 3.35 (m, 1H), 3.38 and 3.39 (2s, 3H), 3.63 and 3.64 (2s, 3H), 3.87 (m, 1H), 3.88 (s, 3H), 3.93 and 3.94 (2s, 3H), 4.48 (m, 1H), 4.55 (m, 1H), 4.79 (m, 1H), 7.05 (m, 1H), 7.12 (m, 1H), 7.31-7.39 (m, 3H), 7.49 (m, 2H), 7.89 (d, 1H), 8.1 (bs, 1H), 9.12 and 9.23 (2s, 1H) ; MS (ES) 781 (M+H⁺).

4.1i Synthesis of Compounds **9** and **10**. To a solution of Compound **8a** (0.1 mg) in PBS buffer solution (pH 7.2) / methanol (300 μL , 2/1) was added a 20 mM solution of DTT (100 μL , 15 equiv.) and monitored the progress of the reaction by HPLC. The reaction underwent too fast to detect, after few seconds the reaction was completed already to give product Compound **10** quantitatively. The reaction intermediate Compound **9** was not detected.

4.1j Synthesis of Compound **11**. To a solution of Compound **6a** (66 mg, 0.2 m mole) in dichloromethane (1 mL) were added DCC (47 mg, 0.22 m mole), HOBT (31 mg, 0.22 mmole) and the compound **4** (50 mg, 0.2 m mole). The mixture thus obtained was stirred at room temperature overnight. The solvent was evaporated and the residue was purified by flash chromatography on silica gel with 1 % methanol in dichloromethane as eluent to give the title compound as an yellow oil (70 mg, 62%). $^1\text{H NMR } \delta$ 1.44 (s, 9H), 2.51 (t, 1H), 2.63 (t, 2H), 2.93 (d, 3H), 3.01 (t, 2H), 3.45 (m, 2H), 3.55 (m, 2H), 3.64 (m, 12H), 3.71 (t, 2H), 5.01 (bs, 1H), 6.38 (bt, 1H), 6.62 (m, 2H), 7.27 (m, 1H), 7.43 (dd, 1H). MS (ES) 491 (M-56+H⁺), 513 (M-56+Na⁺), 547 (M+H⁺), 569 (M+Na⁺)

Compound **11b**: $^1\text{H NMR } \delta$ 1.34 (d, 3H), 1.45 (s, 9H), 2.30 (m, 1H), 2.5 (t, 2H), 2.69 (m, 1H), 2.93 (d, 3H), 3.37-3.55 (m, 5H), 3.63 (m, 12H), 3.71 (t, 2H), 4.99 (bs, 1H), 6.13 (bt, 1H), 6.62 (m, 2H), 7.25 (m, 1H), 7.48 (dd, 1H). MS (ES) 505 (M-56+H⁺), 527 (M-56+Na⁺), 543 (M-56+K⁺), 561 (M+H⁺), 583 (M+Na⁺).

Compound **11c**: 1.43 (s, 3H), 1.45 (s, 9H), 2.46 (s, 2H), 2.5 (t, 2H), 2.92 and 2.94 (2s, 3H), 3.33 (m, 2H), 3.47 (t, 2H), 3.63 (m, 12H), 3.70 (t, 2H), 6.06 (bt, 1H), 6.63 (m, 2H), 7.25 (m, 1H), 7.54 (d, 1H) ; MS (ES) 519 (M-56+H⁺), 541 (M-56+Na⁺), 575 (M+H⁺), 597 (M+Na⁺).

30

4.1k Synthesis of Compound 12: To a suspension of Compound **11a** (20 mg, 0.037 mmole) in dichloromethane (1 mL) were added triethylamine (15 μ L, 0.11 mmole) and a solution of 2 N phosgene in toluene (55 μ L, 0.11 m mole) at 0 °C. The mixture was stirred at room temperature for 1 hour. The mixture was concentrated and the residue was dissolved in dichloromethane (1 mL) and the compound 10 (14 mg, 0.030 mmole) and DMAP (9 mg, 0.076 m mole) were added. The mixture thus obtained was stirred at room temperature overnight. The solvent was evaporated and the residue was purified by flash chromatography on silica gel with 1 % methanol in dichloromethane as eluent to give the title compound as a yellow oil (23 mg, 74%). $^1\text{H NMR } \delta$ 1.44 (s, 9H), 2.49 (t, 2H), 2.67 (m, 2H), 2.65 and 2.67 (2s, 3H), 3.07 (m, 2H), 3.33 (s, 3H), 3.40 (m, 3H), 3.51 (m, 2H), 3.60 (m, 12H), 3.69 (m, 2H), 3.87 (s, 3H), 3.92 (s, 3H), 3.93 (m, 1H), 4.52 (m, 2H), 4.78 (m, 1H), 6.65, 6.74 and 6.97 (3bt, 1H), 7.06 (d, 1H), 7.12 (s, 1H), 7.29-7.42 (m, 3H), 7.50 (m, 2H), 7.87 (d, 1H), 8.10 and 8.15 (2bs, 1H), 9.79 and 9.58 (2s, 1H); MS (ES) 986 ($\text{M}+\text{H}^+-56$), 1042 ($\text{M}+\text{H}^+$).

Compound **12b:** $^1\text{H NMR } \delta$ 1.32 (m, 3H), 1.44 (s, 9H), 2.39 (m, 1H), 2.48 (m, 2H), 2.60 (m, 1H), 2.67 and 2.69 (2s, 3H), 3.32 and 3.35 (2s, 3H), 3.38-3.72 (m, 20H), 3.88 (s, 3H), 3.93 (s, 3H), 3.94 (m, 1H), 4.52 (m, 2H), 4.77 (m, 1H), 6.53, 6.67 and 6.72 (3bt, 1H), 7.06 (d, 1H), 7.12 (s, 1H), 7.29-7.39 (m, 3H), 7.49 (m, 2H), 7.88 (d, 1H), 8.12 and 8.25 (2bs, 1H), 9.13, 9.36, 10.08 and 10.21 (4s, 1H); MS (ES) 1000 ($\text{M}+\text{H}^+-56$), 1056 ($\text{M}+\text{H}^+$), 1078 ($\text{M}+\text{Na}^+$), 1084 ($\text{M}+\text{K}^+$).

Compound **12c:** $^1\text{H NMR } \delta$ 1.30-1.42 (m, 3H), 1.44 (s, 9H), 2.45-2.52 (m, 4H), 2.69 and 2.72 (2s, 3H), 3.34 and 3.35 (2s, 3H), 3.39-3.72 (m, 19H), 3.88 (s, 3H), 3.925 and 3.93 (2s, 3H), 3.94 (m, 1H), 4.53 (m, 2H), 4.80 (m, 1H), 6.63 (m, 1H), 7.06 (dd, 1H), 7.13 (d, 1H), 7.25-7.39 (m, 3H), 7.50 (m, 2H), 7.89 (d, 1H), 8.10 and 8.27 (2bs, 1H), 9.99 and 10.191 (2s, 1H); MS (ES) 1014 ($\text{M}+\text{H}^+-56$), 1070 ($\text{M}+\text{H}^+$), 1108 ($\text{M}+\text{K}^+$).

4.1l Synthesis of Compound 13. Compound **12a** (23 mg, 0.022 mmole) was dissolved in the solution of trifluoroacetic acid and dichloromethane (1 mL, 1 / 1) and the mixture was stirred at room temperature for 30 min and concentrated to give the product (21 mg, 100%) $^1\text{H NMR } \delta$ 2.60 (t, 2H), 2.67 and 2.68 (2s, 3H), 2.75 (m, 2H), 3.07 (m, 2H), 3.34 (s, 3H), 3.38-3.64 (m, 21H), 3.76 (t, 2H), 3.88 (s, 3H), 3.92 (s, 3H), 3.93 (m, 1H), 4.53 (m, 2H), 4.78 (m,

1H), 7.06 (d, 1H), 7.13 (s, 1H), 7.31-7.43 (m, 3H), 7.49 (m, 2H), 7.87 (d, 1H), 8.10 and 8.15 (2bs, 1H), 9.44 and 9.65 (2s, 1H); MS (ES) 986 (M+H⁺), 1008 (M+Na⁺), 1024 (M+K⁺).

Compound **13b**: ¹H NMR δ 1.34 (m, 3H), 2.56 (m, 1H), 2.62 (m, 2H), 2.68 (m, 3H), 2.8 (m, 1H), 3.35-3.36 (2s, 3H), 3.40-3.70 (m, 18H), 3.77 (t, 2H), 3.88 (s, 3H), 3.93 and 3.95 (2s, 3H), 3.94 (m, 1H), 4.54 (m, 2H), 4.79 (m, 1H), 7.07 (d, 2H), 7.13 (s, 1H), 7.30-7.42 (m, 3H), 7.49 (m, 2H), 7.88 (d, 1H), 8.11 and 8.25 (2bs, 1H), 9.22, 9.37, 9.80 and 9.92 (4s, 1H); MS (ES) 1000 (M+H⁺), 1022 (M+Na⁺), 1038 (M+K⁺).

Compound **13c**: ¹H NMR δ 1.30-1.45 (m, 6H), 2.54 (m, 2H), 2.61 (m, 2H), 2.68 and 2.69 (2s, 3H), 3.35-3.36 (2s, 3H), 3.40-3.70 (m, 17H), 3.77 (t, 2H), 3.88 (s, 3H), 3.92 and 3.93 (2s, 3H), 3.94 (m, 1H), 4.50 (m, 2H), 4.80 (m, 1H), 7.08 (m, 2H), 7.12 (d, 1H), 7.29-7.39 (m, 3H), 7.49 (m, 2H), 7.89 (m, 1H), 8.10 and 8.25 (2bs, 1H), 9.88 and 10.04 (2s, 1H); MS (ES) 1014 (M+H⁺), 1036 (M+Na⁺), 1054 (M+K⁺).

4.1m Synthesis of Compound 14a. To a solution of Compound **13a** (5.4 mg, 0.0054 mmole) in dichloromethane (1 mL) were added PS-carbodiimide (11.5 mg, 0.94 mmole / g, 0.0108 mmole), and PS-DMAP (7.2 mg, 1.49 mmole / g, 0.0108 mmole). The mixture thus obtained was stirred at room temperature overnight, filtrated and concentrated to give the product. MS (ES) 1082 (M+H⁺).

4.2 Synthesis of Disulfide Linker Conjugated with Tubulysin A

The drug Tubulysin A can be conjugated to the disulfide linker of the current invention using the mechanism shown hereinabove. Other drugs and other linkers of the current invention can be synthesized using similar reaction schemes.

4.3 Rate of Cyclization of a Disulfide Linker

5

To a solution of Compound **8a** (0.1 mg) in PBS buffer solution (pH 7.2) / methanol (300 μ L, 2/1) was added a 20 mM solution of DTT (100 μ L, 15 equiv.) and the progress of the reaction was monitored by HPLC. The reaction underwent rapid cyclization, with the reaction being completed within a few seconds to give product **10** quantitatively. The reaction intermediate **9** was not detected.

Example 5

5 Synthesis of Compound 32. To a solution of Compound 30 (120 mg, 0.28 mmole) in ethyl acetate (10 mL) was bubbled HCl gas for 5 min. The reaction mixture was stirred at RT for another 30 min and then the mixture was concentrated. Ether was added to the reaction mixture and the white precipitate was collected on a filter funnel. Solid was dried overnight under vacuum to give 100mg of the desired product which was confirmed by LC-MS (ESI) 324 ($\text{M}+\text{H}^+$) and used in next step without further purification. To a solution of this

10 compound (100 mg, 0.24 mmole) in DMF (5 mL) were added compound 31 (65 mg, 0.26 mmole), HATU (100 mg, 0.26 mmole) and TEA (91 μL , 0.52 mmole). The mixture thus obtained was stirred at room temperature for 3 hrs. The solvent was evaporated and the residue was purified on semi-preparative HPLC with 0.1% TFA in water and acetonitrile as

eluent to give compound **32** as an oil (110 mg, 80%). The desired product was confirmed by LC-MS (ESI) 555 (M+H⁺).

Synthesis of Compound 33. A solution of Compound **32** (110 mg, 0.2 mmole) and palladium on charcoal (20 mg) in DCM (10 mL) and methanol (5 mL) was stirred under hydrogen atmospheric pressure at room temperature for 12 hrs. The palladium was filtrated and the reaction mixture was concentrated and the residue was purified on semi-preparative HPLC with 0.1% TFA in water and acetonitrile as eluent to give the desired compound as an oil (80 mg, 78%) LC-MS (ESI) 465 (M+H⁺). To a solution of the residue (80 mg, 0.17 mmole) in dichloromethane (10 mL) and THF (5 mL) was added PNPCl (4-nitrophenyl chloroformate) (137 mg, 0.68 mmole) and triethyl amine (144 uL, 1.02 mmol) at 0°C. The mixture thus obtained was stirred for 30 min at 0°C and then at room temperature for 12 hrs. The reaction mixture was concentrated under vacuum, and the residue was precipitated using ethyl ether (100 mL) to give compound **33** as a yellow solid (90 mg, 82%) which was dried under vacuum and confirmed by LC-MS (ESI) 631 (M+H⁺).

Synthesis of Compound 34: To a solution of 2-bromoethylamine bromide (5 g, 24.4 mmole) in DMF (50 mL) was added diisopropylethylamine (8.5 mL, 48.8 mmole) and benzyl chloroformate (3.48 mL, 24.4 mmole). The mixture thus obtained was stirred at room temperature for 2 hours. The reaction mixture was concentrated and the residue was purified by flash chromatography on silica gel with ethyl acetate/hexanes (3/7) as eluent to give the desired compound **34** as an oil (4 g, 64%). ¹H NMR (CDCl₃) δ 3.54 (bs, 2H), 3.61 (bs, 2H), 5.12 (s, 2H), 7.36 (m, 5H).

Synthesis of Compound 35: To a solution of Compound **34** (3.34 g, 12.99 mmole) and valine tert-butyl ester (3.27 g, 15.59 mmole) in DMF (50 mL) was added potassium carbonate (5.39 g, 38.97 mmole) and potassium iodide (2.59 g, 15.59 mmole). The mixture thus obtained was stirred at 100°C overnight. The reaction mixture was concentrated and the residue was purified by flash chromatography on silica gel with ethyl acetate/hexanes (2/8) as eluent to give the desired compound **35** as an oil (3.12 g, 69%). ¹H NMR (CDCl₃) δ 0.92

(m, 6H), 1.46 (s, 9H), 1.86 (m, 1H), 2.53 (m, 1H), 2.80 (m, 2H), 3.18 (m, 1H), 3.31 (m, 1H), 5.10 (s, 2H), 5.25 (bs, 1H), 7.36 (m, 5H); LC-MS (ESI) 296 (M+H-*t*butyl⁺), 352 (M+H⁺).

Synthesis of Compound 36. A solution of Compound **35** (3.4 g, 9.72 mmole) and palladium on charcoal (200 mg) in methanol (30 mL) was placed under hydrogen atmospheric pressure at room temperature. The mixture thus obtained was stirred at room temperature for 2 hours. The palladium was filtrated and the reaction mixture was concentrated to dryness to give the desired compound **36** as an oil (2.1 g, 98%)

Synthesis of Compound 37. To a solution of Compound **36** (2.1 g, 9.72 mmole) in dichloromethane (30 mL) was added FmocOSu (9-fluorenylmethoxycarbonyl-*N*-hydroxysuccinimide ester) (3.28 g, 9.72 mmole) at 0°C. The mixture thus obtained was stirred for 2 hours at 0°C. The solvent were removed on the rotovap, and the residue was purified by flash chromatography on silica gel with dichloromethane, followed by 0.5% methanol in dichloromethane and finally 1% methanol in dichloromethane as eluent to give the desired compound **37** as colorless oil (2.55 g, 60%). ¹H-NMR (CDCl₃) δ 0.95 (ft, 6H), 1.48 (s, 9H), 1.90 (m, 1H), 2.55 (m, 1H), 2.82 (m, 2H), 3.18 (m, 1H), 3.32 (m, 1H), 4.24 (m, 1H), 4.37 (m, 2H), 5.40 (bs, 1H), 7.30 (m, 2H), 7.39 (m, 2H), 7.60 (d, 2H), 7.75 (d, 2H) ppm; LC-MS (ESI) 383 (M+H-*t*butyl⁺), 440 (M+H⁺), 462 (M+Na⁺), 478 (M+K⁺).

Synthesis of Compound 38. To a solution of Compound **37** (177 mg, 0.4 mmole) in tetrahydrofuran-water (3/1, 8 mL) was bubbled HCl gas for 5 min. The reaction mixture was stirred at 37°C overnight then the mixture was concentrated to dryness to give the desired compound **38** as solid (168 mg, 98%) which was confirmed by LC-MS (ESI) 383 (M+H⁺), 405 (M+Na⁺) and used in next step without further purification. LC-MS (ESI) 383 (M+H⁺), 405 (M+Na⁺).

Synthesis of Compound 39. To a solution of Compound **5** (525 mg, 0.79 mmole) in DMF (5 mL) was added *N*-Boc-*N,N'*-dimethylethylenediamine (177 mg, 0.94 mmole). The mixture thus obtained was stirred at room temperature for 30 min. The solvent was removed and the

residue was purified by flash chromatography on silica gel with dichloromethane, followed by 2% methanol in dichloromethane and finally 5% methanol in dichloromethane as eluent to give the desired compound **39** as colorless oil (364 mg, 65%). ¹H-NMR (CD₃OD) δ 1.39 (s, 9H), 1.56 (m, 2H), 1.70 (m, 1H), 1.82 (m, 1H), 2.70 and 2.82 (2s, 3H), 2.90 (s, 3H), 3.09 (m, 1H), 3.17 (m, 1H), 3.30 to 3.37 (m, 4H), 4.16 (t, 1H), 4.27 (m, 1H), 4.33 (d, 2H), 5.02 (bs, 2H), 7.24 to 7.36 (m, 6H), 7.51 to 7.65 (m, 4H), 7.74 (d, 2H) ppm; LC-MS (ESI) 618 (M+H-Boc⁺), 662 (M+H-*t*butyl⁺), 718 (M+H⁺), 740 (M+Na⁺), 1435 (2M+H⁺).

Synthesis of Compound 40. Compound **40** was prepared as described above for Compound **17a** in 98% yield. LC-MS (ESI) 396 (M+H-Boc⁺), 496 (M+H⁺), 517 (M+Na⁺), 533 (M+K⁺), 992 (2M+H⁺).

Synthesis of Compound 41. To a solution of Compound **40** (138 mg, 0.28 mmole) in DMF (4 mL) were added the Compound **38** (110 mg, 0.28 mmole), HOBT (36 mg, 0.28 mmole) and EDC (1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (50 mg, 0.28 mmole). The mixture thus obtained was stirred at room temperature overnight. The solvent was evaporated and the residue was purified on semi-preparative HPLC with 0.1% TFA in water and acetonitrile as eluent to give the desired compound **41** as an oil (178 mg, 70%).

¹H-NMR (CD₃OD) δ 1.04 and 1.11 (2d, 6H), 1.40 (s, 9H), 1.58 (m, 2H), 1.77 (m, 1H), 1.88 (m, 1H), 2.24 (m, 1H), 2.72 and 2.84 (2s, 3H), 2.92 (s, 3H), 3.10 to 3.18 (m, 4H), 3.35 to 3.46 (m, 6H), 3.82 (d, 1H), 4.22 (t, 1H), 4.41 (m, 2H), 4.59 (m, 1H), 5.04 (bs, 2H), 7.28 to 7.40 (m, 6H), 7.55 (m, 2H), 7.63 (m, 2H), 7.78 (d, 2H) ppm; LC-MS (ESI) 760 (M+H-Boc⁺), 804 (M+H-*t*butyl⁺), 860 (M+H⁺), 882 (M+Na⁺), 899 (M+K⁺).

Synthesis of Compound 42. Compound **42** was prepared as described above for Compound **17a** in 98% yield. LC-MS (ESI) 538 (M+H-Boc⁺), 582 (M+H-*t*butyl⁺), 638 (M+H⁺), 660 (M+Na⁺).

Synthesis of Compound 43. To a solution of Compound **42** (23 mg, 0.036 mmole) in dichloromethane (1 mL) were added GMBS (N-(maleimidobutyryloxy)succinimide ester)

(14 mg, 0.05 mmole) and diisopropylethylamine (8.4 μ L, 0.05 mmole) at 0°C. The mixture was warmed up to room temperature slowly and the stirring was continued for additional 30 min. The solvent was evaporated and the residue was purified on semi-preparative HPLC with 0.1% TFA in water and acetonitrile as eluent to give the desired compound **43** as an oil (26 mg, 79%). ¹H-NMR (CD₃OD) δ 1.06 and 1.12 (2d, 6H), 1.41 (s, 9H), 1.59 (m, 2H), 1.78 (m, 1H), 1.86 to 1.93 (m, 3H), 2.24 (m, 3H), 2.74 and 2.84 (2s, 3H), 2.93 (bs, 3H), 3.13 to 3.22 (m, 4H), 3.40 to 3.60 (m, 8H), 3.82 (d, 1H), 4.60 (m, 1H), 5.05 (bs, 2H), 6.80 (s, 2H), 7.32 (m, 2H), 7.57 (d, 2H), 8.78 (d, 1H) ppm; LC-MS (ESI) 703 (M+H-Boc⁺), 747 (M+H-*t*butyl⁺), 803 (M+H⁺), 825 (M+Na⁺), 841 (M+K⁺).

10

Synthesis of Compound 44. Compound **44** was prepared as described above for Compound **15a** in 98% yield. LC-MS (ESI) 703 (M+H⁺), 725 (M+Na⁺).

Synthesis of Compound 45. To a solution of Compound **44** (15 mg, 0.016 mmole) and

Compound **33** (10 mg, 0.016 mmole) in DMF (0.8 mL) was added diisopropylethylamine (5.5 μ L, 0.032 mmole) at room temperature. The mixture thus obtained was stirred at room temperature overnight. The solvent was evaporated and the residue was purified on semi-preparative HPLC with 0.1% TFA in water and acetonitrile as eluent to give the desired compound **45** as an oil (10 mg, 45%). ¹H-NMR (CD₃OD) δ 1.02 to 1.13 (m, 6H), 1.55 (m, 2H), 1.74 (m, 1H), 1.84 to 1.92 (m, 3H), 2.20 to 2.27 (m, 3H), 2.95 to 3.14 (m, 16H), 3.47 to 3.84 (m, 12H), 3.98 (m, 1H), 4.2 to 4.34 (m, 3H), 4.57 (m, 1H), 4.69 (m, 2H), 5.07 to 5.17 (m, 2H), 6.78 (s, 2H), 7.16 to 7.23 (m, 3H), 7.30 (m, 1H), 7.38 to 7.47 (m, 3H), 7.52 to 7.58 (m, 3H), 7.81 to 7.92 (m, 2H), 8.25 (bs, 1H) ppm; LC-MS (ESI) 1194 (M+H⁺), 1215 (M+Na⁺), 1233 (M+K⁺).

25

Example 6

Synthesis of Compound (2). A solution of **1** (100 mg, 0.24 mmol) and 10% Pd-C (35 mg) in MeOH/CH₂Cl₂ (1/2, 10 ml) was degassed in vacuo for 40 s. The resulting mixture was placed under an atmosphere of hydrogen and stirred at 25 °C for 7 h. The reaction mixture was filtered through Celite (CH₂Cl₂ wash). The solvent was removed in vacuo. Chromatography on silica gel eluted with EtOAc/Hex (2/8) afforded **2** (77 mg, 98%). ¹NMR DMSO-d₆) δ 10.36 (s, 1H), 8.04 (d, 1H, J=8.2 Hz), 7.72 (d, 1H, J=8.2 Hz), 7.61 (br s, 1H), 7.45 (t, 1H, J=8.4 Hz), 7.261 (t, 1H, J=8.4 Hz), 4.06 (m, 4H), 3.73 (m, 1H), 1.52 (s, 9H).

Synthesis of Compound (4). A solution of **2** (35 mg, 0.1 mmol) in 4 M HCl-EtOAc (5 ml) was stirred at 25 °C under Ar for 30 min. The solvent was removed in vacuo. To the residue was added 5-acetylidone-2-carboxylic acid (24.4 mg, 0.12 mmol). A solution of EDC (22.9 mg, 0.12 mmol) in DMF (3 ml) was added and the reaction mixture was stirred at 25 °C for 5 h. The solvent was removed. The crude product was chromatographed on silica gel eluted with 10% MeOH in CH₂Cl₂ to give **4** (40.7mg, 93%). ¹HNMR DMSO-d₆) δ 12.13 (s, 1H), 10.47 (s, 1H), 8.45 (s, 1H), 8.10 (d, 1H, J=8.4 Hz), 7.96 (br s, 1H), 7.85 (d, 2H, J=8.4 Hz), 7.54 (d, 1H, J=8.4 Hz), 7.51 (t, 1H, J=8.2 Hz), 7.36 (t, 1H, J=7.6), 7.35 (s, 1H), 4.81 (t, 1H,

11.2 Hz), 4.54 (dd, 1H, 8.8 Hz), 4.23 (m, 1H), 4.01 (dd, 1H, J=10.2 Hz), 3.86 (dd, 1H, J=10.7 Hz), 2.61 (s, 3H).

Synthesis of Compound (5). 4-Methyl-1-piperazinecarbonyl chloride hydrochloride (19.9

5 mg, 0.1 mmol) was added to a solution of **4** (20 mg, 0.05 mmol) and anhydrous pyridine (25 μ ml, 0.3 mmol) in 3% allyl alcohol in dry methylene chloride (4 ml) and the mixture was stirred for 16 h. Purification of the crude product on silica gel yielded **5** (23.6 mg, 91%).

¹NMR DMSO-d₆) δ 12.03 (s, 1H), 8.41 (s, 1H), 8.21 (s, 1H), 8.01 (d, 1H, J=8.4 Hz), 7.88 (d, 1H, J=8.4 Hz), 7.82 (dd, 1H, J=8.4 Hz), 7.58 (t, 1H, J=8.1 Hz), 7.51 (d, 1H, J=8.4 Hz), 7.46 (t, 1H, J=7.6 Hz), 7.37 (s, 1H), 4.86 (t, 1H, J=10.8 Hz), 4.57 (dd, 1H, J=10.8 Hz), 4.38 (m, 1H), 4.06 (dd, 1H, J=10.8 Hz), 3.86 (dd, 1H, J=11 Hz), 3.41 (br, 4H), 3.29 (br, 4H), 2.82 (s, 3H), 2.57 (s, 3H).

Synthesis of Compound (7). A solution of **5** (13 mg, 24 μ mol) and linker **6** (16.9 mg, 31

15 μ mol) in 5% acetic acid in dry methylene chloride (1 ml) was stirred for 30 min at 25 °C. The solvent was completely removed in vacuo and purified by HPLC (SymmetryPrep C₁₈, 7 μ m, 19 x 150 mm column) to give **7** (18.5 mg, 81%). MS: calcd for C₄₈H₅₇ClN₈O₁₁ (M+H) m/z 958.38, found 958.10.

20 **EXAMPLE 7**

5

Synthesis of Compound 1

To a solution of 2-bromoethylamine bromide (5 g, 24.4 mmole) in DMF (50 mL) was added diisopropylethylamine (8.5 mL, 48.8 mmole) and benzyl chloroformate (3.48 mL, 24.4 mmole). The mixture thus obtained was stirred at room temperature for 2 hours. The reaction mixture was concentrated and the residue was purified by flash chromatography on silica gel with ethyl acetate/hexanes (3/7) as gradient to give Compound 1 as an oil (4 g, 64%). ¹H NMR (CDCl₃) δ 3.54 (bs, 2H), 3.61 (bs, 2H), 5.12 (s, 2H), 7.36 (m, 5H).

Synthesis of Compound 2

To a solution of Compound 1 (3.34 g, 12.99 mmole) and valine tert-butyl ester (3.27 g, 15.59 mmole) in DMF (50 mL) was added potassium carbonate (5.39 g, 38.97 mmole) and potassium iodide (2.59 g, 15.59 mmole). The mixture thus obtained was stirred at 100°C overnight. The reaction mixture was concentrated and the residue was purified by flash chromatography on silica gel with ethyl acetate/hexanes (2/8) as gradient to give Compound 2 as an oil (3.12 g, 69%). ¹H NMR (CDCl₃) δ 0.92 (m, 6H), 1.46 (s, 9H), 1.86 (m, 1H), 2.53 (m, 1H), 2.80 (m, 2H), 3.18 (m, 1H), 3.31 (m, 1H), 5.10 (s, 2H), 5.25 (bs, 1H), 7.36 (m, 5H); LC-MS (ESI) 296 (M+H-*t*butyl⁺), 352 (M+H⁺).

Synthesis of Compound 3

A solution of Compound 2 (3.4 g, 9.72 mmole) and palladium on charcoal (200 mg) in methanol (30 mL) was placed under hydrogen atmospheric pressure at room temperature. The mixture thus obtained was stirred at room temperature for 2 hours. The palladium was filtrated and the reaction mixture was concentrated to dryness to give Compound 3 as an oil (2.1 g, 98%). ¹H NMR (CD₃OD) δ 0.94 (m, 6H), 1.47 (s, 9H), 1.63 (bs, 2H), 1.90 (m, 1H), 2.47 (m, 1H), 2.73 (m, 2H).

Synthesis of Compound 4

To a solution of Compound 3 (2.1 g, 9.72 mmole) in dichloromethane (30 mL) was added FmocOSu (N-(9-Fluorenylmethoxycarbonyloxy)succinimide (3.28 g, 9.72 mmole) at 0°C. The mixture thus obtained was stirred for 2 hours at 0°C. The mixture was concentrated to dryness and then the residue was purified by flash chromatography on silica

gel with 100% dichloromethane, followed by 0.5% methanol in dichloromethane and finally 1% methanol in dichloromethane as gradient to give Compound 4 as colorless oil (2.55 g, 60%). ¹H-NMR (CDCl₃) δ 1.03 (d, 3H), 1.14 (d, 3H), 1.52 (s, 9H), 2.28 (m, 1H), 3.14 (m, 2H), 3.46 (m, 2H), 3.89 (d, 1H), 4.24 (m, 1H), 4.44 (m, 2H), 7.29 (m, 2H), 7.40 (m, 2H), 7.64 (m, 2H), 7.80 (d, 2H); LC-MS (ESI) 383 (M+H-*t*butyl⁺), 440 (M+H⁺), 462 (M+Na⁺), 478 (M+K⁺).

Synthesis of Compound 5

To a solution of Compound 4 (177 mg, 0.4 mmole) in tetrahydrofurane-water (3/1, 8 mL) was bubbled HCl gas for 5 min. The reaction mixture was stirred at 37°C overnight then the mixture was concentrated to dryness to give Compound 5 as solid (168 mg, 98%) which was used in next step without further purification. ¹H-NMR (CDCl₃) δ 1.04 (d, 3H), 1.14 (d, 3H), 2.32 (m, 1H), 3.18 (m, 2H), 3.46 (m, 2H), 3.95 (d, 1H), 4.22 (m, 1H), 4.42 (m, 2H), 7.29 (m, 2H), 7.39 (m, 2H), 7.64 (m, 2H), 7.79 (d, 2H); LC-MS (ESI) 383 (M+H⁺), 405 (M+Na⁺).

Synthesis of Compound 23

A solution of ethyl-5-nitroindole-2 carboxylate (2 g, 8.5 mmole) and palladium on charcoal (200 mg) in 50% methanol in dichloromethane (100 mL) was placed under hydrogen atmospheric pressure at room temperature. The mixture thus obtained was stirred at room temperature for 2 hours. The palladium was filtrated and the reaction mixture was concentrated to dryness to give Compound 23 as colorless oil (1.68 g, 97%). ¹H NMR (CD₃OD) δ 1.38 (t, 3H), 4.34 (q, 2H), 6.86 (dd, 1H), 6.95 (d, 1H), 6.98 (d, 1H), 7.25 (d, 1H).

Synthesis of Compound 24

To a solution of Compound 23 (300 mg, 1.47 mmole) in dichloromethane (5 mL) was added Boc₂O (385 mg, 1.76 mmole). The mixture thus obtained was stirred at room temperature for 2 hours. The reaction mixture was concentrated and the residue was purified by flash chromatography on silica gel with 10% ethyl acetate in hexanes as gradient to give

Compound **24** as a white solid (272 mg, 61%). ¹H NMR (CD₃OD) δ 1.39 (t, 3H), 1.52 (s, 9H), 4.37 (q, 2H), 7.07 (s, 1H), 7.23 (dd, 1H), 7.34 (d, 1H), 7.68 (bs, 1H).

Synthesis of Compound 25

5 A solution of Compound **24** (100 mg, 0.33 mmole) in ethanol (3 mL) was added a solution of LiOH (12 mg, 0.49 mmole) in water (1 mL). The mixture thus obtained was stirred at room temperature for 2 hours at 50°C. The reaction mixture was concentrated to dryness to give an oil. The residue was dissolved in water and acidified to pH 3 with 10% HCl, followed by extraction with EtOAc. The organic solution was dried over Na₂SO₄,
10 filtered and concentrated to dryness to give Compound **25** as colorless oil (85 mg, 92%). ¹H NMR (CD₃OD) δ 1.51 (s, 9H), 7.07 (d, 1H), 7.23 (dd, 1H), 7.33 (d, 1H), 7.68 (bs, 1H).

Synthesis of Compound 26

15 To a solution of Fmoc-Cit-OH (206 mg, 0.52 mmole) in solution of 30% DMF in dichloromethane (3 mL) were added EDC (120 mg, 0.62 mmole), HOBt (84 mg, 0.62 mmole) and tert-butyl-4-amino benzoate (120 mg, 0.62 mmole) at room temperature. The mixture thus obtained was stirred for 10 minutes then copper chloride (84 mg, 0.62 mmole) was added to the mixture. The mixture was stirred overnight. The mixture was concentrated to dryness and then the residue was purified by flash chromatography on silica gel with 5%
20 methanol in dichloromethane as gradient to give Compound **26** as colorless oil (184 mg, 62%). ¹H NMR (CD₃OD) δ 1.53-1.58 (m, 2H), 1.57 (s, 9H), 1.71 (m, 1H), 1.82 (m, 1H), 3.08 (m, 1H), 3.19 (m, 1H), 4.21 (m, 1H), 4.28 (m, 1H), 4.38 (m, 2H), 7.28-7.39 (m, 3H), 7.49 (m, 2H), 7.56-7.86 (m, 5H), 7.89 (m, 2H); LC-MS (ESI), 573 (M+H⁺), 595 (M+Na⁺), 611 (M+K⁺).

25

Synthesis of Compound 27

To a solution of Compound **26** (1 g, 1.75 mmole) in DMF (18 mL) was added piperidine (2 mL) at room temperature. The mixture thus obtained was stirred at room temperature for 1 hour. The mixture was concentrated to dryness and then the residue was
30 purified by flash chromatography with 100% dichloromethane, followed by 5% methanol in

dichloromethane and finally 20% methanol in dichloromethane as gradient to give a colorless oil (561 mg, 92%).

To a solution of the oil (561 mg, 1.6 mmole) in DMF (10 mL) were added diisopropylethylamine (679 μ L, 3.9 mmole), the compound **5** (509 mg, 1.3 mmole) (see Example 1 for preparation) and HATU (494 mg, 1.3 mmole) at room temperature. The mixture thus obtained was stirred at room temperature for 3 hours. The mixture was concentrated to dryness and then the residue was purified by flash chromatography on silica gel with 5% methanol in dichloromethane as gradient to give Compound **27** as colorless oil (691 mg, 65%). ^1H NMR (CD_3OD) δ 1.36 (dd, 6H), 1.58-1.62 (m, 2H), 1.6 (s, 9H), 1.71 (m, 1H), 1.82 (m, 1H), 2.00 (m, 1H), 2.65 (m, 2H), 3.2-3.3 (m, 4H), 3.70 (m, 1H), 4.21 (m, 1H), 4.28 (m, 2H), 4.38 (m, 2H), 4.60 (m, 1H), 7.28-7.39 (m, 4H), 7.60-7.70 (m, 4H), 7.8 (d, 2H), 7.89 (d, 2H); LC-MS (ESI), 716 ($\text{M}+\text{H}^+$), 737 ($\text{M}+\text{Na}^+$), 753 ($\text{M}+\text{K}^+$).

Synthesis of Compound 28

To a solution of Compound **27** (300 mg, 0.45 mmole) in DMF (9 mL) was added piperidine (1 mL) at room temperature. The mixture thus obtained was stirred at room temperature for 1 hour. Then the mixture was concentrated to dryness to give an oil which was crashed out in ether (20 mL). The material was filtered to give a white solid (186 mg, 84%).

To a solution of the free amine (32 mg, 0.065 mmole) in dichloromethane (1 mL) was added MAL-PEG₄-NH ester (50 mg, 0.097 mmole). The mixture thus obtained was stirred at room temperature for 4 hours. The solvent was evaporated and the residue was purified by semi-preparative HPLC to give Compound **28** as an oil (47 mg, 95%). ^1H NMR (CD_3OD) δ 1.10 and 1.15 (2d, 6H), 1.58-1.62 (m, 2H), 1.6 (s, 9H), 1.75 (m, 1H), 1.90 (m, 1H), 2.25 (m, 1H), 2.45 (t, 2H), 2.5 (t, 2H), 3.10-3.25 (m, 4H), 3.30 (m, 2H), 3.45-3.65 (m, 16H), 3.75 (m, 4H), 3.85 (d, 1H), 4.65 (m, 1H), 6.80 (s, 2H), 7.67 (d, 2H), 7.90 (d, 2H), 8.80 (d, 1H), 10.20 (s, 1H); LC-MS (ESI), 891 ($\text{M}+\text{H}^+$), 913 ($\text{M}+\text{Na}^+$), 929 ($\text{M}+\text{K}^+$).

Synthesis of Compound 29

To a solution of Compound **28** (47 mg, 0.062 mmole) in dichloromethane (0.5 mL) was added trifluoroacetic acid (0.5 mL) at room temperature. The mixture thus obtained was stirred at room temperature for 30 minutes. Then the mixture was concentrated to dryness to give Compound **29** as an oil which was used in next step without further purification (40 mg, 92%). ¹H NMR (CD₃OD) δ 1.10 and 1.15 (2d, 6H), 1.60 (m, 2H), 1.80 (m, 1H), 1.90 (m, 1H), 2.25 (m, 1H), 2.45 (t, 2H), 2.5 (t, 2H), 3.10-3.25 (m, 4H), 3.30 (m, 2H), 3.45-3.65 (m, 16H), 3.75 (m, 4H), 3.85 (d, 1H), 4.65 (m, 1H), 6.80 (s, 2H), 7.67 (d, 2H), 7.95 (d, 2H), 8.80 (d, 1H); LC-MS (ESI), 836 (M+H⁺), 858 (M+Na⁺), 874 (M+K⁺).

10 Synthesis of Compound 31

To a solution of **30** (100 mg, 0.2 mmole) in EtOAc (2 mL) was added a concentrated HBr solution in EtOAc (3 mL) at room temperature. The Boc deprotection was completed after 1 hour. The precipitated material was filtered (quantitative yield). Then the TFA salted amine was dissolved in DMF (3 mL). To this solution were added the compound **25** (55 mg, 0.2 mmole), diisopropylethylamine (173 μL, 1 mmole) and HATU (79 mg, 0.2 mmole). The mixture thus obtained was stirred at room temperature for 3 hours. The solvent was evaporated and the residue was purified by semi-preparative HPLC to give Compound **31** as a white solid (86 mg, 57%). ¹H NMR (CD₃OD) δ 1.54 (s, 9H), 2.91 (s, 3H), 3.10-3.60 (m, 8H), 3.72 (m, 1H), 3.97 (m, 1H), 4.30-4.60 (m, 3H), 6.94 (bs, 1H), 7.05 (m, 1H), 7.12 (d, 1H), 7.45 (m, 2H), 7.68 (d, 1H), 7.75 (bs, 1H), 7.86 (d, 1H), 8.23 (bs, 1H); LC-MS (ESI), 562 (M+H-100⁺), 606 (M+H-56⁺), 662 (M+H⁺), 685 (M+Na⁺), 701 (M+K⁺).

Synthesis of Compound 32

To a solution of Compound **31** (30 mg, 0.039 mmole) in dichloromethane (0.5 mL) were added anisole (100 μL) and trifluoroacetic acid (0.4 mL) at room temperature. The mixture thus obtained was stirred at room temperature for 30 minutes. Then the mixture was concentrated to dryness to give an oil which was used in next step without further purification.

To a solution of the oil in DMF (1 mL) were added the Compound **29** (36 mg, 0.039 mmole), diisopropylethylamine (40 μL, 0.23 mmole) and HATU (15 mg, 0.039 mmole). The

mixture thus obtained was stirred at room temperature for 1 hour. The solvent was evaporated and the residue was purified by semi-preparative HPLC to give Compound **32** as an oil (36 mg, 60%). ¹H NMR (CD₃OD) δ 1.09 and 1.15 (2d, 6H), 1.62 (m, 2H), 1.81 (m, 1H), 1.93 (m, 1H), 2.27 (m, 1H), 2.45 (t, 2H), 2.51 (t, 2H), 2.98 (s, 3H), 3.13-3.25 (m, 4H), 3.47-3.62 (m, 24H), 3.76 (m, 4H), 3.82 (m, 1H), 3.85 (d, 1H), 4.20 (m, 1H), 4.55-4.70 (m, 4H), 6.79 (s, 2H), 7.06 (s, 1H), 7.36 (bs, 1H), 7.43-7.54 (m, 2H), 7.72-7.81 (m, 3H), 7.91 (m, 3H), 8.05 (s, 1H), 8.25 (bs, 1H), 8.82 (d, 1H), 10.25 (s, 1H); LC-MS (ESI), 691 (M+2H⁺)/2, 1381 (M+H⁺), 1419 (M+K⁺).

10 **EXAMPLE 8: Proliferation Assays**

The biological activity of the cytotoxic compounds of the invention can be assayed using the well established ³H-thymidine proliferation assay. This is a convenient method for quantitating cellular proliferation, as it evaluates DNA synthesis by measuring the incorporation of exogenous radiolabeled ³H-thymidine. This assay is highly reproducible and can accommodate large numbers of compounds.

To carry out the assay, promyelocytic leukemia cells, HL-60, are cultured in RPMI media containing 10 % heat inactivated fetal calf serum (FCS). On the day of the study, the cells are collected, washed and resuspended at a concentration of 0.5 x 10⁶ cells/ml in RPMI containing 10% FCS. 100 μl of cell suspension is added to 96 well plates. Serial dilutions (3-fold increments) of doxorubicin (as a positive control) or test compounds are made and 100 μl of compounds are added per well. Finally 10 μl of a 100 μCi/ml ³H-thymidine is added per well and the plates are incubated for 24 hours. The plates are harvested using a 96 well Harvester (Packard Instruments) and counted on a Packard Top Count counter. Four parameter logistic curves are fitted to the ³H-thymidine incorporation as a function of drug molarity using Prism software to determine IC₅₀ values.

The compounds of the invention generally have an IC₅₀ value in the above assay of from about 1 pM to about 100 nM, preferably from about 10 pM to about 10 nM.

EXAMPLE 9: Conjugation of Drug-Linker Molecules to Antibodies

This example describes reaction conditions and methodologies for conjugating a drug-linker molecule of the invention (optionally including other groups, such as spacers, reactive functional groups and the like) to an antibody as a targeting agent, X⁴. The conditions and methodologies are intended to be exemplary only and non-limiting. Other approaches for conjugating drug-linker molecules to antibodies are known in the art.

The conjugation method described herein is based on introduction of free thiol groups to the antibody through reaction of lysines of the antibody with 2-iminothiolane, followed by reaction of the drug-linker molecule with an active maleimide group. Initially the antibody to be conjugated was buffer exchanged into 0.1M phosphate buffer pH 8.0 containing 50mM NaCl, 2mM DTPA, pH 8.0 and concentrated to 5-10 mg/ml. Thiolation was achieved through addition of 2-iminothiolane to the antibody. The amount of 2-iminothiolane to be added was determined in preliminary experiments and varies from antibody to antibody. In the preliminary experiments, a titration of increasing amounts of 2-iminothiolane was added to the antibody, and following incubation with the antibody for one hour at room temperature, the antibody was desalted into 50mM HEPES buffer pH 6.0 using a Sephadex G-25 column and the number of thiol groups introduced determined rapidly by reaction with dithiodipyridine (DTDP). Reaction of thiol groups with DTDP results in liberation of thiopyridine which is monitored at 324nm. Samples at a protein concentration of 0.5-1.0 mg/ml were used. The absorbance at 280nm was used to accurately determine the concentration of protein in the samples, and then an aliquot of each sample (0.9ml) was incubated with 0.1 ml DTDP (5mM stock solution in ethanol) for 10 minutes at room temperature. Blank samples of buffer alone plus DTDP were also incubated alongside. After 10 minutes, absorbance at 324nm was measured and the number of thiols present quantitated using an extinction coefficient for thiopyridine of 19800M⁻¹.

Typically a thiolation level of three thiol groups per antibody is desired. For example, with one particular antibody this was achieved through adding a 15 fold molar excess of 2-iminothiolane followed by incubation at room temperature for 1 hour. Antibody to be conjugated was therefore incubated with 2-iminothiolane at the desired molar ratio and then desalted into conjugation buffer (50mM HEPES buffer pH 6.0 containing 5mM Glycine,

3% Glycerol and 2mM DTPA). The thiolated material was maintained on ice whilst the number of thiols introduced was quantitated as described above.

After verification of the number of thiols introduced, the drug-linker molecule containing an active maleimide group was added at a 3-fold molar excess per thiol. The conjugation reaction was carried out in conjugation buffer also containing a final concentration of 5% ethylene glycol dimethyl ether (or a suitable alternative solvent). Commonly, the drug-linker stock solution was dissolved in 90% ethylene glycol dimethyl ether, 10% dimethyl sulfoxide. For addition to antibody, the stock solution can be added directly to the thiolated antibody, which has enough ethylene glycol dimethyl ether added to bring the final concentration to 5%, or pre-diluted in conjugation buffer containing a final concentration of 10% ethylene glycol dimethyl ether, followed by addition to an equal volume of thiolated antibody.

The conjugation reaction was incubated at room temperature for 2 hours with mixing. Following incubation the reaction mix was centrifuged at 14000 RPM for 15 minutes and the pH was adjusted to 7.2 if purification was not immediate. Purification of conjugate was achieved through chromatography using a number of methods. Conjugate can be purified using size-exclusion chromatography on a Sephacryl S200 column pre-equilibrated with 50mM HEPES buffer pH 7.2 containing 5mM glycine, 50mM NaCl and 3% glycerol. Chromatography was carried out at a linear flow rate of 28 cm/h. Fractions containing conjugate were collected, pooled and concentrated. Alternatively purification can be achieved through ion-exchange chromatography. Conditions vary from antibody to antibody and need to be optimized in each case. For example, antibody-drug conjugate reaction mix was applied to an SP-Sepharose column pre-equilibrated in 50mM HEPES, 5mM Glycine, 3%glycerol, pH 6.0. The antibody conjugate was eluted using a gradient of 0-1M NaCl in equilibration buffer. Fractions containing the conjugate were pooled, the pH was adjusted to 7.2 and the sample concentrated as required.

EXAMPLE 10: In Vivo Studies

A. Treatment of *in vivo* tumor xenografts

Anti-PSMA (2A10, see co-owned U.S. Patent Application Serial Number 60/654,125, filed February 18, 2005, incorporated herein by reference) and isotype control antibody (anti-CD70 IgG1 clone 2H5, (see co-owned U.S. Patent Application Serial Number

exclusion chromatography on a Sephacryl S200 column pre-equilibrated with 0.1M phosphate buffer (pH 7.2) containing 50mM NaCl and 5% (v/v) DMSO. Fractions containing monomeric conjugate were collected and pooled. The resulting purified conjugates were then concentrated in a stirred cell under nitrogen, using a 10kDa cut-off membrane.

- 5 Concentrations and substitution ratios (number of drug molecules attached per antibody molecule) of the conjugates were determined using absorbance at 280nm and 340nm, by reference to the extinction coefficients of both antibody and Compound A at each wavelength as previously measured.

10 Anti-tumor efficacy of anti-PSMA (2A10 clone) conjugated to Compound A was tested on LNCaP, which is human prostate carcinoma xenografts, grown in male CB17.SCID mice (available from Taconic, Germantown, NY). LNCaP prostate cancer cells expressing high levels of PSMA were obtained from ATCC (Cat# CRL-1740) and expanded *in vitro* following ATCC instruction. 8 week-old male CB17.SCID mice from Taconic were implanted subcutaneously in the right flank with 2.5×10^6 LNCaP cells in 0.2 ml of
 15 PBS/Matrigel (1:1) per mouse. Mice were weighed and measured for tumor three dimensionally using an electronic caliper twice weekly starting three weeks post implantation. Individual tumor volume was calculated as height x width x length. Mice with vascularized tumors (determined by appearance of the tumors) of appropriate sizes were randomized into treatment groups and were dosed per individual body weight on Day 0.
 20 Mice were monitored for tumor growth around 60 days post dosing and terminated at the end of the study. Mice were euthanized when the tumors reached tumor end point (1500 mm^3).

Table 1. LNCaP Xenograft Study Summary

Treatment	Dose ($\mu\text{mole/kg}$ Cytotoxics)	N per group	Dosing Route	Average Tumor Volume at Day -1 (mm^3)
Vehicle	-	3	ip	100
Isotype Ab-Cmpd A Conjugate	0.3	3	ip	100
2A10-Cmpd A Conjugate	0.3	3	ip	100

25

As shown in Fig. 1, 0.3 $\mu\text{mole/kg}$ (referring to the moles of the cytotoxin Compound A) of the 2A10-Compound A conjugate induced complete regression of all three established small LNCaP tumors.

B. Dose-Response Study

5 Anti-PSMA (2A10) was buffer exchanged into 0.1M phosphate buffer pH 8.0 containing 50mM NaCl and 2mM DTPA, and concentrated to 5.6mg/ml. Antibody was then thiolated by incubation with a 7.5-fold molar excess of 2-iminothiolane for one hour at room temperature, followed by desalting into 50mM HEPES buffer pH 6.0 containing 5mM glycine, 2mM DTPA and 3% (v/v) glycerol using a Sephadex G-25 column. Thiolated
10 antibody was maintained on ice, whilst the number of thiol groups introduced was determined. This was achieved by reaction of a sample of thiolated antibody with dithiodipyridine (DTDP). The absorbance at 280nm was measured to determine the concentration of protein in the samples, and then an aliquot of each sample (0.9ml) was incubated with 0.1ml DTDP (5mM stock solution in ethanol) for 10 minutes at room
15 temperature. Blank samples of buffer alone plus DTDP were incubated alongside. Absorbance at 324nm was measured and the number of thiols present per antibody quantitated using an extinction coefficient for thiopyridine of 19800 M^{-1} .

The thiolated antibody was then incubated with a 2-fold molar excess of Compound A over the molar concentration of thiol groups. Compound A, 5mM stock
20 solution in 10% (v/v) DMSO/90% (v/v) ethylene glycol dimethyl ether, was added to the thiolated antibody along with sufficient ethylene glycol dimethyl ether to bring the final concentration to 5% (v/v). After incubation at room temperature for 2 hours the antibody-Compound A conjugate was purified by ion-exchange chromatography. Reaction mix was applied to an SP-Sepharose column pre-equilibrated in buffer A (50mM HEPES, 5mM
25 glycine, 3% (v/v) glycerol, pH 6.0). The column was washed with buffer A, then with 95% buffer A, 5% buffer B (50mM HEPES, 1M NaCl, 5mM glycine, 3% (v/v) glycerol, pH 7.2) and then antibody-Compound A conjugate was eluted with 10% buffer B, 90% buffer A. Fractions containing monomeric conjugate were collected and pooled and the pH adjusted to 7.2 by addition of monoethanolamine. The resulting purified conjugate was then dialysed

into 50mM HEPES, 100mM NaCl, 5mM glycine, 3% (v/v) glycerol, pH 7.2 and then concentrated in a stirred cell under nitrogen, using a 10kDa cut-off membrane. Concentrations and substitution ratios (number of drug molecules attached per antibody molecule) of the conjugate was determined using absorbance at 280nm and 340nm, by reference to the extinction coefficients of both antibody and Compound A at each wavelength as previously measured. The isotype control (anti-CD70 2H5) conjugate was prepared using the same method except that elution of conjugate from the ion-exchange column was achieved with 15% buffer B, 85% buffer A.

Efficacy and selectivity of the conjugates was determined using LNCaP human prostate carcinoma xenografts grown in male CB17.SCID mice as described above. The design of this xenograft study is summarized in table 2.

Table 2. LNCaP Xenograft Study Summary

Treatment	Dose (μ mole/kg Cytotoxin)	N per group	Dosing Route	Average Tumor Volume at Day -1 (mm^3)
Vehicle	-	9	ip	160
Isotype Ab-Cmpd A	0.05, 0.15, 0.30, 0.45, 0.60, 0.90	9	ip	160
2A10-Cmpd A	0.05, 0.15, 0.30, 0.45, 0.60, 0.90	9	ip	160

As shown in Table 2 and Figs. 2-3, 0.15 μ mole/kg of anti-PSMA-Compound A (Fig. 2) had better anti-tumor efficacy than 0.90 μ mole/kg of isotype control-Compound A, indicating at least >6x selectivity (Fig. 3). 0.90 μ mole/kg of anti-PSMA-Compound A only showed transient toxicity (Fig.5) and was below the maximum tolerated dose. Therefore, an over 6-fold therapeutic index was identified for anti-PSMA-Compound A in LNCaP-tumor-bearing mice.

C. Efficacy on Large Tumors

Anti-PSMA (2A10) was buffer exchanged into 0.1M phosphate buffer pH8.0 containing 50mM NaCl and 2mM DTPA, and concentrated to 5.6mg/ml. Antibody was then

thiolated by incubation with a 9-fold molar excess of 2-iminothiolane for one hour at room temperature, followed by desalting into 50mM HEPES buffer pH6.0 containing 5mM glycine, 2mM DTPA and 3% (v/v) glycerol using a Sephadex G-25 column. Thiolated antibody was maintained on ice, whilst the number of thiol groups introduced was
5 determined. This was achieved by reaction of a sample of thiolated antibody with dithiodipyridine (DTDP). The absorbance at 280nm was measured to determine the concentration of protein in the samples, and then an aliquot of each sample (0.9ml) was incubated with 0.1ml DTDP (5mM stock solution in ethanol) for 10 minutes at room temperature. Blank samples of buffer alone plus DTDP were incubated alongside.
10 Absorbance at 324nm was measured and the number of thiols present per antibody quantitated using an extinction coefficient for thiopyridine of 19800M^{-1} .

The thiolated antibody was then incubated with a 2-fold molar excess of Compound A over the molar concentration of thiol groups. Compound A, 5mM stock solution in 10% (v/v) DMSO 90% (v/v) ethylene glycol dimethyl ether, was added to the
15 thiolated antibody along with sufficient ethylene glycol dimethyl ether to bring the final concentration to 5% (v/v). After incubation at room temperature for 2 hours the antibody-Compound A conjugate was purified by ion-exchange chromatography. Reaction mix was applied to an SP-Sepharose column pre-equilibrated in 50mM HEPES, 5mM glycine, 3% (v/v) glycerol, pH 6.0 (buffer A). The column was washed with buffer A, then with 95%
20 buffer A, 5% buffer B (50mM HEPES, 1M NaCl, 5mM glycine, 3% (v/v) glycerol, pH 7.2) and then antibody-Compound A conjugate was eluted with 10% buffer B, 90% buffer A. Fractions containing monomeric conjugate were collected and pooled and the pH adjusted to 7.2 by addition of monoethanolamine. The resulting purified conjugate was then dialysed
25 into 50mM HEPES, 100mM NaCl, 5mM glycine, 3% (v/v) glycerol, pH 7.2 and then concentrated in a stirred cell under nitrogen, using a 10kDa cut-off membrane. Concentrations and substitution ratios (number of drug molecules attached per antibody molecule) of the conjugate was determined using absorbance at 280nm and 340nm, by reference to the extinction coefficients of both antibody and Compound A at each wavelength as previously measured. The isotype control (anti-CD70 2H5) conjugate was

prepared using the same method except that elution of conjugate from the ion-exchange column was achieved with 15% buffer B, 85% buffer A.

Efficacy and selectivity of the conjugates was determined using LNCaP human prostate carcinoma xenografts grown in male CB17.SCID mice as described above.

5 The design of these xenograft studies is summarized in tables 3 & 4.

Table 3. LNCaP Xenograft Study Summary

Treatment	Dose ($\mu\text{mole/kg}$ Cytotoxin)	N per group	Dosing Route	Average Tumor Volume at Day -1 (mm^3)
Vehicle	-	8	iv	240
Isotype Ab-Cmpd A	0.15	8	iv	240
2A10-Cmpd A	0.15	8	iv	240

10 As shown in Table 3 and Fig. 6, a single low dose of 0.15 $\mu\text{mole/kg}$ of anti-PSMA-Compound A greatly inhibited growth of established large LNCaP tumors of average sizes of 240 mm^3 . In contrast, 0.15 $\mu\text{mole/kg}$ of isotype control-Compound A had minimal anti-tumor efficacy. As shown in Table 4 and Fig. 7, a single dose of 0.30 $\mu\text{mole/kg}$ of anti-PSMA-Compound A induced regression and inhibited growth of very large LNCaP tumors
15 of average sizes of 430 mm^3 .

Table 4. LNCaP Xenograft Study Summary

Treatment	Dose ($\mu\text{mole/kg}$ Cytotoxin)	N per group	Dosing Route	Average Tumor Volume at Day -1 (mm^3)
Vehicle	-	6	ip	430
2A10-Cmpd A	0.15, 0.30, 0.45	6	ip	430

20 Example 11: In Vivo Studies

The following samples were prepared in general accordance with the examples provided above.

Group	Test substances	Conc. (mg/ml)	Substitution ratio	Storage
1	IgG1 isotype control	5.00	-	4°C
2	Anti-CD70 antibody (CD70.1)	5.00	-	4°C
3	Defucosylated anti-CD70 antibody (CD70.1 df)	5.30	-	4°C
4	Toxin 1-conjugated anti-CD70 antibody (CD70.1 - Toxin 1)	3.00	1.7	-80°C
5	Toxin1-conjugated defucosylated anti-CD70 antibody (CD70.1 df - Toxin 1)	2.98	1.7	-80°C
6	Toxin2-conjugated anti-CD70 antibody (CD70.1 - Toxin 2)	2.50	1.8	-80°C

Toxin 1

Toxin 2

5

Five (5) freshly collected buffy coat samples from healthy volunteer donors were obtained. The peripheral blood mononuclear cells (PBMC) were purified using gradient centrifugation according to Ficoll-Paque[®] plus procedure (Ref 07907, StemCell Technologies, Meylan, France). The viability of PBMC cells were assessed by 0.25% trypan blue exclusion before FACS analyses as well as before *in vivo* injection.

10

The five CD markers listed in the following table were analyzed:

Antigen	Main antigen expression
CD3	T cells
CD14	Monocytes, macrophages, Langerhans cells
CD16b	Granulocytes neutrophil only
CD20	Precursor B cells subset, B cells
CD56	NK cells, T cell subset

Two different PBMC samples were used, a first for Groups 1 to 3 (study of naked antibodies) and a second for Groups 4 to 6 (study of toxin-conjugated antibodies). The criteria for selection were the total cell number, the highest CD56 percentage, and cell viability.

5 Tumors were induced subcutaneously by injecting 5×10^6 786-O cells in 200 μ l of RPMI 1640 into the right flank of 78 NOD-SCID mice. These 786-O cells were shown to express the target antigen CD70 by FACS using the same antibody as used in these *in vivo* experiments. The treatment started when the mean tumor volume reached 80 mm³ (about 15 days). Before the start of treatments, 48 tumor bearing mice
10 out of 78 grafted were randomized into & 6 groups of 8 animals. The mean tumor volume of each group was comparable and not statistically different from the other groups (analysis of variance). The 48 randomized mice received a single IP injection of human PBMC sample, with 3.6×10^7 cells per mouse (corresponding to 4.81×10^6 CD56 positive cells per mouse) for groups 1 to 3 and 4.5×10^7 cells per mouse (corresponding to
15 4.79×10^6 CD56 positive cells per mouse) for groups 4 to 6.

The treatment schedule was as follows:

Group	Number of mice	Treatment	Dose (mg/kg/inj)	Treatment volume (ml) (25 g mouse)	Adm. Route	Treatment schedule
1	8	IgG1 isotype control	15	0.250	IP	Q4Dx
2	8	Anti-CD70 antibody	15	0.250	IP	Q4Dx
3	8	Anti-CD70 defucosylated antibody	15	0.250	IP	Q4Dx

Group	Number of mice	Treatment	Dose (μ g/kg/inj)	Treatment volume (ml) (25 g mouse)	Adm. Route	Treatment schedule
4	8	CD70.1 - Toxin 1	0.3	0.226	IV	Q14Dx2
5	8	CD70.1 df - Toxin 1	0.3	0.424	IV	Q14Dx2
6	8	CD70.1 - Toxin 2	0.3	0.085	IV	single

- The mice from group 1 received repeated IP injections of IgG1 isotype control at 15
20 mg/kg/inj following the schedule Q4Dx,
- The mice from group 2 received repeated IP injections of anti-CD70 antibody at 15 mg/kg/inj following the schedule Q4Dx,

- The mice from group 3 received repeated IP injections of anti-CD70 defucosylated antibody at 15 mg/kg/inj following the schedule Q4Dx,
- The mice from group 4 will received two IV injections of toxin 1-conjugated anti-CD70 antibody following the schedule Q14Dx2,
- 5 • The mice from group 5 received two IV injections of toxin 1-conjugated anti-CD70 defucosylated antibody following the schedule Q14Dx2,
- The mice from group 6 received a single IV injection of toxin 2-conjugated anti-CD70 antibody.

10 Fig. 8 illustrates the tumor size over the course of the study. Each of the antibody conjugated toxin resulted in decreased tumor size, particularly when compared to the growth without either toxin. Fig. 9 illustrates the body weight over the course of the study

15 Each of the patent applications, patents, publications, and other published documents mentioned or referred to in this specification is herein incorporated by reference in its entirety, to the same extent as if each individual patent application, patent, publication, and other published document was specifically and individually indicated to be incorporated by reference.

20 While the present invention has been described with reference to the specific embodiments thereof, it should be understood by those skilled in the art that various changes may be made and equivalents may be substituted without departing from the true spirit and scope of the invention and the appended claims. In addition, many modifications may be made to adapt a particular situation, material, composition of matter, process, process step or steps, to the objective, spirit and scope of the present invention. All such modifications are
25 intended to be within the scope of the claims appended hereto.

WHAT IS CLAIMED IS:

1. An antibody-drug conjugate, comprising:
an antibody having specificity for at least one type of tumor;
a drug; and
a linker coupling the drug to the antibody, wherein the linker is cleavable in the presence of the tumor;
wherein the antibody-drug conjugate retards growth of the tumor when administered in an amount corresponding to a daily dosage of 1 $\mu\text{mole/kg}$ or less.
2. The antibody-drug conjugate of claim 1, wherein the antibody-drug conjugate retards growth of the tumor when administered in an amount corresponding to a daily dosage of 1 $\mu\text{mole/kg}$ or less over a period of at least five days.
3. The antibody-drug conjugate of claim 1, wherein the tumor is a human-type tumor in a SCID mouse.
4. The antibody-drug conjugate of claim 1, wherein the antibody-drug conjugate retards growth of the tumor when administered in an amount corresponding to a daily dosage of 0.6 $\mu\text{mole/kg}$ or less over a period of at least five days.
5. The antibody-drug conjugate of claim 1, wherein the antibody-drug conjugate retards growth of the tumor when administered in an amount corresponding to a daily dosage of 0.3 $\mu\text{mole/kg}$ or less over a period of at least five days.
6. The antibody-drug conjugate of claim 1, wherein the antibody-drug conjugate retards growth of the tumor when administered in an amount corresponding to a daily dosage of 0.15 $\mu\text{mole/kg}$ or less over a period of at least five days.

7. The antibody-drug conjugate of claim 1, wherein the antibody-drug conjugate arrests growth of the tumor when administered in an amount corresponding to a daily dosage of 1 $\mu\text{mole/kg}$ or less over a period of at least five days.

8. The antibody-drug conjugate of claim 1, wherein the antibody-drug conjugate arrests growth of the tumor when administered in an amount corresponding to a daily dosage of 0.6 $\mu\text{mole/kg}$ or less over a period of at least five days.

9. The antibody-drug conjugate of claim 1, wherein the antibody-drug conjugate arrests growth of the tumor when administered in an amount corresponding to a daily dosage of 0.3 $\mu\text{mole/kg}$ or less over a period of at least five days.

10. The antibody-drug conjugate of claim 1, wherein the antibody-drug conjugate arrests growth of the tumor when administered in an amount corresponding to a daily dosage of 0.15 $\mu\text{mole/kg}$ or less over a period of at least five days.

11. The antibody-drug conjugate of claim 1, wherein the linker comprises a hydrazine moiety cleavable in the presence of the tumor.

12. The antibody-drug conjugate of claim 1, wherein the linker comprises a polypeptide cleavable in the presence of the tumor.

13. The antibody-drug conjugate of claim 1, wherein the tumor is a carcinoma tumor.

14. The antibody-drug conjugate of claim 1, wherein the tumor is a prostate carcinoma tumor.

15. The antibody-drug conjugate of claim 1, wherein the drug is selected from the group consisting of: duocarmycins, CC-1065, CBI-based duocarmycin analogues, MCBI-

based duocarmycin analogues, CCBI-based duocarmycin analogues, dolastatins, dolestatin-10, combretastatin, calicheamicin, maytansine, maytansine analogues, DM-1, auristatin E, auristatin EB (AEB), auristatin EFP (AEFP), monomethyl auristatin E (MMAE), tubulysins, disorazole, epothilones, Paclitaxel, docetaxel, Topotecan, echinomycin, estramustine, cemadotin, eleutherobin, methopterin, actinomycin, daunorubicin, daunorubicin conjugates, mitomycin C, mitomycin A, vincristine, taxol, taxotere retinoic acid, and camptothecin.

16. The antibody-drug conjugate of claim 1, wherein the drug has a structure:

wherein the ring system A is a member selected from substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl and substituted or unsubstituted heterocycloalkyl groups;

E and G are members independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, a heteroatom, a single bond, or E and G are joined to form a ring system selected from substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl and substituted or unsubstituted heterocycloalkyl;

X is a member selected from O, S and NR²³;

R²³ is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl;

R³ is a member selected from the group consisting of (=O), SR¹¹, NHR¹¹ and OR¹¹,

wherein

R¹¹ is a member selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted heteroalkyl, unsubstituted heteroalkyl, diphosphates,

triphosphates, acyl, $C(O)R^{12}R^{13}$, $C(O)OR^{12}$, $C(O)NR^{12}R^{13}$, $P(O)(OR^{12})_2$, $C(O)CHR^{12}R^{13}$, SR^{12} and $SiR^{12}R^{13}R^{14}$,

in which

R^{12} , R^{13} , and R^{14} are members independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl and substituted or unsubstituted aryl, wherein R^{12} and R^{13} together with the nitrogen or carbon atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more heteroatoms;

R^4 , R^5 , R^6 and R^7 are members independently selected from the group consisting of H, substituted alkyl, unsubstituted alkyl, substituted aryl, unsubstituted aryl, substituted heteroaryl, unsubstituted heteroaryl, substituted heterocycloalkyl, unsubstituted heterocycloalkyl, halogen, NO_2 , $NR^{15}R^{16}$, $NC(O)R^{15}$, $OC(O)NR^{15}R^{16}$, $OC(O)OR^{15}$, $C(O)R^{15}$, SR^{15} , OR^{15} , $CR^{15}=NR^{16}$, and $O(CH_2)_nN(CH_3)_2$

wherein

n is an integer from 1 to 20;

R^{15} and R^{16} are independently selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, substituted or unsubstituted heterocycloalkyl, and substituted or unsubstituted peptidyl, wherein R^{15} and R^{16} together with the nitrogen atom to which they are attached are optionally joined to form a substituted or unsubstituted heterocycloalkyl ring system having from 4 to 6 members, optionally containing two or more heteroatoms;

R^6 is a single bond which is either present or absent and when present R^6 and R^7 are joined to form a cyclopropyl ring; and

R^7 is CH_2-X^1 or $-CH_2-$ joined in said cyclopropyl ring with R^6 ,

wherein

X^1 is a leaving group,

wherein at least one of R^{11} , R^{12} , R^{13} , R^{15} or R^{16} is coupled to the linker, or the drug is a pharmaceutically acceptable salt thereof.

17. The antibody-drug conjugate of claim 16, wherein the drug has the structure:

wherein

Z is a member selected from O, S and NR²³

wherein

R²³ is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl;

R¹ is H, substituted or unsubstituted lower alkyl, C(O)R⁸, or CO₂R⁸, wherein R⁸ is a member selected from NR⁹R¹⁰ and OR⁹,

in which

R⁹ and R¹⁰ are members independently selected from H, substituted or unsubstituted alkyl and substituted or unsubstituted heteroalkyl;

R¹ is H, substituted or unsubstituted lower alkyl, or C(O)R⁸, wherein R⁸ is a member selected from NR⁹R¹⁰ and OR⁹,

in which

R⁹ and R¹⁰ are members independently selected from H, substituted or unsubstituted alkyl and substituted or unsubstituted heteroalkyl;

R² is H, or substituted or unsubstituted lower alkyl or unsubstituted heteroalkyl or cyano or alkoxy; and

R² is H, or substituted or unsubstituted lower alkyl or unsubstituted heteroalkyl,

wherein at least one of R¹¹, R¹², R¹³, R¹⁵ or R¹⁶ is coupled to the linker, or the drug is a pharmaceutically acceptable salt thereof.

18. The antibody-drug conjugate of claim 16, wherein the drug has the structure:

wherein

Z is a member selected from O, S and NR²³

wherein

R²³ is a member selected from H, substituted or unsubstituted alkyl, substituted or unsubstituted heteroalkyl, and acyl;

R¹ is H, substituted or unsubstituted lower alkyl, C(O)R⁸, or CO₂R⁸, wherein R⁸ is a member selected from group consisting of substituted alkyl, unsubstituted alkyl, NR⁹R¹⁰, NR⁹NHR¹⁰, and OR⁹

in which

R⁹ and R¹⁰ are members independently selected from H, substituted or unsubstituted alkyl and substituted or unsubstituted heteroalkyl; and

R² is H, substituted alkyl or unsubstituted lower alkyl;

wherein at least one of R¹¹, R¹², R¹³, R¹⁵ or R¹⁶ is coupled to the linker, or the drug is a pharmaceutically acceptable salt thereof.

19. The antibody-drug conjugate of claim 1, wherein the antibody-drug conjugate is selected from

and

wherein Ab is the antibody, X¹ is Cl or Br, and PEG is a polyethylene glycol moiety.

20. The antibody-drug conjugate of claim 1, wherein the antibody-drug conjugate is selected from

and

21. A pharmaceutical formulation comprising an antibody-drug conjugate according to claim 1 and a pharmaceutically acceptable carrier.

22. A method of killing a tumor cell, said method comprising administering to said tumor cell an amount of an antibody-drug conjugate according to claim 1 sufficient to kill said cell.

23. A method of retarding or stopping the growth of a tumor in a mammalian subject, comprising administering to said subject an amount of an antibody-drug conjugate according to claim 1, sufficient to retard or stop the growth.

24. A compound selected from:

and

wherein r is an integer in the range from 0 to 24.
