(54) Abstract Title: **Additives to enhance metal and amine removal in refinery desalting processes**

(57) Apparatus for use by a golfer with a putter, and the method of its use, for perfecting golf putting strokes are disclosed. The apparatus comprises a member, removably and firmly attachable at/near its lower end to the shaft of the putter, and extending upwardly from the point of attachment and having an upper end, and the upper end of the member being adapted to contact an appropriate part of the anatomy of the golfer. The arrangement taught is such that, when the golfer executes a correct putting stroke, the upper end of the member remains in contact with that part of the golfer's anatomy throughout the whole of the swing but, if the stroke is not correct, the upper end of the member either loses contact, or moves across, or presses harder into the anatomy of the golfer. The member may be adapted to have more than one upper end. A contact means in the form of a resilient ball or the like is fixed to the or each upper end. These are capable of giving an audible or visual warning of loss of contact with the golfer's body or of increased contact pressure with the body. Scale markings are provided so that, once a correct setting has been achieved, the same settings can be achieved for a subsequent training session.
