**SPATIAL LOCATION PRESENTATION IN HEAD WORN COMPUTING**

**CROSS REFERENCE TO RELATED APPLICATIONS**

[0001] This application claims the benefit of priority to and is a continuation-in-part of the following U.S. patent applications, each of which is hereby incorporated by reference in its entirety:

[0002] U.S. non-provisional application Ser. No. 14/185,990, entitled Secure Sharing in Head Worn Computing, filed Feb. 21, 2014;

[0003] U.S. non-provisional application Ser. No. 14/181,473 entitled Secure Sharing in Head Worn Computing, filed Feb. 14, 2014;

[0004] U.S. non-provisional application Ser. No. 14/178,047, entitled Micro Doppler Presentations in Head Worn Computing, filed Feb. 11, 2014; and

[0005] U.S. non-provisional application Ser. No. 14/185,988, entitled Micro Doppler Presentations in Head Worn Computing, filed Feb. 21, 2014.

**BACKGROUND**

[0006] 1. Field of the Invention

[0007] This invention relates to head worn computing. More particularly, this invention relates to spatial presentation of virtual content associated with identified locations in head worn computing.

[0008] 2. Description of Related Art

[0009] Wearable computing systems have been developed and are beginning to be commercialized. Many problems persist in the wearable computing field that need to be resolved to make them meet the demands of the market.

**SUMMARY**

[0010] Aspects of the present invention relate to methods and systems for spatial presentation of virtual content associated with identified locations in head worn computing.

[0011] These and other systems, methods, objects, features, and advantages of the present invention will be apparent to those skilled in the art from the following detailed description of the preferred embodiment and the drawings. All documents mentioned herein are hereby incorporated in their entirety by reference.

**BRIEF DESCRIPTION OF THE DRAWINGS**

[0012] Embodiments are described with reference to the following Figures. The same numbers may be used throughout to reference like features and components that are shown in the Figures:

[0013] FIG. 1 illustrates a head worn computing system in accordance with the principles of the present invention.

[0014] FIG. 2 illustrates a head worn computing system with optical system in accordance with the principles of the present invention.

[0015] FIG. 3a illustrates a large prior art optical arrangement.

[0016] FIG. 3b illustrates an upper optical module in accordance with the principles of the present invention.

[0017] FIG. 4 illustrates an upper optical module in accordance with the principles of the present invention.

[0018] FIG. 4a illustrates an upper optical module in accordance with the principles of the present invention.

[0019] FIG. 4b illustrates an upper optical module in accordance with the principles of the present invention.

[0020] FIG. 5 illustrates an upper optical module in accordance with the principles of the present invention.

[0021] FIG. 5a illustrates an upper optical module in accordance with the principles of the present invention.

[0022] FIG. 5b illustrates an upper optical module and dark light trap according to the principles of the present invention.

[0023] FIG. 5c illustrates an upper optical module and dark light trap according to the principles of the present invention.

[0024] FIG. 5d illustrates an upper optical module and dark light trap according to the principles of the present invention.

[0025] FIG. 5e illustrates an upper optical module and dark light trap according to the principles of the present invention.

[0026] FIG. 6 illustrates upper and lower optical modules in accordance with the principles of the present invention.

[0027] FIG. 7 illustrates angles of combiner elements in accordance with the principles of the present invention.

[0028] FIG. 8 illustrates upper and lower optical modules in accordance with the principles of the present invention.

[0029] FIG. 8a illustrates upper and lower optical modules in accordance with the principles of the present invention.

[0030] FIG. 8b illustrates upper and lower optical modules in accordance with the principles of the present invention.

[0031] FIG. 8c illustrates upper and lower optical modules in accordance with the principles of the present invention.

[0032] FIG. 9 illustrates an eye imaging system in accordance with the principles of the present invention.

[0033] FIG. 10 illustrates a light source in accordance with the principles of the present invention.

[0034] FIG. 10a illustrates a back lighting system in accordance with the principles of the present invention.

[0035] FIG. 10b illustrates a back lighting system in accordance with the principles of the present invention.

[0036] FIGS. 11a to 11d illustrate light source and filters in accordance with the principles of the present invention.

[0037] FIGS. 12a to 12c illustrate light source and quantum dot systems in accordance with the principles of the present invention.

[0038] FIGS. 13a to 13c illustrate peripheral lighting systems in accordance with the principles of the present invention.

[0039] FIGS. 14a to 14c illustrate a light suppression systems in accordance with the principles of the present invention.

[0040] FIG. 15 illustrates an external user interface in accordance with the principles of the present invention.

[0041] FIGS. 16a to 16c illustrate distance control systems in accordance with the principles of the present invention.

[0042] FIGS. 17a to 17c illustrate force interpretation systems in accordance with the principles of the present invention.

[0043] FIGS. 18a to 18c illustrate user interface mode selection systems in accordance with the principles of the present invention.

[0044] FIG. 19 illustrates interaction systems in accordance with the principles of the present invention.

[0045] FIG. 20 illustrates external user interfaces in accordance with the principles of the present invention.

[0046] FIG. 21 illustrates mD trace representations presented in accordance with the principles of the present invention.

[0047] FIG. 22 illustrates mD trace representations presented in accordance with the principles of the present invention.

[0048] FIG. 23 illustrates an mD scanned environment in accordance with the principles of the present invention.

[0049] FIG. 23a illustrates mD trace representations presented in accordance with the principles of the present invention.

[0050] FIG. 24 illustrates a communication network in accordance with the principles of the present invention.

[0051] FIG. 25 illustrates a sharing FOV in accordance with the principles of the present invention.

[0052] FIG. 26 illustrates a sharing technology in accordance with the principles of the present invention.

[0053] FIG. 26 illustrates a sharing technology in accordance with the principles of the present invention.

[0054] FIG. 27 illustrates a sharing technology in accordance with the principles of the present invention.

[0055] FIG. 28 illustrates a sharing technology in accordance with the principles of the present invention.

[0056] FIG. 29 illustrates a sharing technology in accordance with the principles of the present invention.

[0057] FIG. 30 illustrates a sharing technology in accordance with the principles of the present invention.

[0058] FIG. 31 illustrates a sharing technology in accordance with the principles of the present invention.

[0059] FIG. 32 illustrates a sharing technology in accordance with the principles of the present invention.

[0060] FIG. 33 illustrates a sharing technology in accordance with the principles of the present invention.

[0061] FIG. 34 illustrates an object shadowing technology in accordance with the principles of the present invention.

[0062] FIG. 35 illustrates location marking and visualization technologies in accordance with the principles of the present invention.

[0063] FIG. 36 illustrates location marking and visualization technologies in accordance with the principles of the present invention.

[0064] FIG. 37 illustrates location marking and visualization technologies in accordance with the principles of the present invention.

[0065] FIG. 38 illustrates location marking and visualization technologies in accordance with the principles of the present invention.

[0066] FIG. 39 illustrates location marking, tracking and visualization based in part on a tactical plan in accordance with the principles of the present invention.

[0067] FIG. 40 illustrates location marking, tracking and visualization based in part on a directional antenna signal in accordance with the principles of the present invention.

[0068] FIG. 41 illustrates location marking, and visualization of a health condition of a person at an identified location in accordance with the principles of the present invention.

[0069] FIG. 42 illustrates location marking, tracking and visualization of past activities in accordance with the principles of the present invention.

[0070] While the invention has been described in connection with certain preferred embodiments, other embodiments would be understood by one of ordinary skill in the art and are encompassed herein.

#### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT(S)

[0071] Aspects of the present invention relate to head-worn computing (“HWC”) systems. HWC involves, in some instances, a system that mimics the appearance of head-worn glasses or sunglasses. The glasses may be a fully developed computing platform, such as including computer displays presented in each of the lenses of the glasses to the eyes of the user. In embodiments, the lenses and displays may be configured to allow a person wearing the glasses to see the environment through the lenses while also seeing, simultaneously, digital imagery, which forms an overlaid image that is perceived by the person as a digitally augmented image of the environment, or augmented reality (“AR”).

[0072] HWC involves more than just placing a computing system on a person’s head. The system may need to be designed as a lightweight, compact and fully functional computer display, such as wherein the computer display includes a high resolution digital display that provides a high level of emersion comprised of the displayed digital content and the see-through view of the environmental surroundings. User interfaces and control systems suited to the HWC device may be required that are unlike those used for a more conventional computer such as a laptop. For the HWC and associated systems to be most effective, the glasses may be equipped with sensors to determine environmental conditions, geographic location, relative positioning to other points of interest, objects identified by imaging and movement by the user or other users in a connected group, and the like. The HWC may then change the mode of operation to match the conditions, location, positioning, movements, and the like, in a method generally referred to as a contextually aware HWC. The glasses also may need to be connected, wirelessly or otherwise, to other systems either locally or through a network. Controlling the glasses may be achieved through the use of an external device, automatically through contextually gathered information, through user gestures captured by the glasses sensors, and the like. Each technique may be further refined depending on the software application being used in the glasses. The glasses may further be used to control or coordinate with external devices that are associated with the glasses.

[0073] Referring to FIG. 1, an overview of the HWC system 100 is presented. As shown, the HWC system 100 comprises a HWC 102, which in this instance is configured as glasses to be worn on the head with sensors such that the HWC 102 is aware of the objects and conditions in the environment 114. In this instance, the HWC 102 also receives and interprets control inputs such as gestures and movements 116. The HWC 102 may communicate with external user interfaces 104. The external user interfaces 104 may provide a physical user interface to take control instructions from a user of the HWC 102 and the external user interfaces 104 and the HWC 102 may communicate bi-directionally to affect the user’s command and provide feedback to the external device 108. The HWC 102 may also communicate bi-directionally with externally controlled or coordinated local devices 108. For example, an external user interface 104 may be used in connection with the HWC 102 to control an externally controlled or coordinated local device 108. The externally controlled or coordinated local device 108 may provide feedback to the HWC 102 and a customized GUI may be presented in the HWC 102 based on the type of device or specifically identified device 108. The HWC 102 may also interact with

remote devices and information sources **112** through a network connection **110**. Again, the external user interface **104** may be used in connection with the HWC **102** to control or otherwise interact with any of the remote devices **108** and information sources **112** in a similar way as when the external user interfaces **104** are used to control or otherwise interact with the externally controlled or coordinated local devices **108**. Similarly, HWC **102** may interpret gestures **116** (e.g. captured from forward, downward, upward, rearward facing sensors such as camera(s), range finders, IR sensors, etc.) or environmental conditions sensed in the environment **114** to control either local or remote devices **108** or **112**.

[0074] We will now describe each of the main elements depicted on FIG. 1 in more detail; however, these descriptions are intended to provide general guidance and should not be construed as limiting. Additional description of each element may also be further described herein.

[0075] The HWC **102** is a computing platform intended to be worn on a person's head. The HWC **102** may take many different forms to fit many different functional requirements. In some situations, the HWC **102** will be designed in the form of conventional glasses. The glasses may or may not have active computer graphics displays. In situations where the HWC **102** has integrated computer displays the displays may be configured as see-through displays such that the digital imagery can be overlaid with respect to the user's view of the environment **114**. There are a number of see-through optical designs that may be used, including ones that have a reflective display (e.g. LCoS, DLP), emissive displays (e.g. OLED, LED), hologram, TIR waveguides, and the like. In embodiments, lighting systems used in connection with the display optics may be solid state lighting systems, such as LED, OLED, quantum dot, quantum dot LED, etc. In addition, the optical configuration may be monocular or binocular. It may also include vision corrective optical components. In embodiments, the optics may be packaged as contact lenses. In other embodiments, the HWC **102** may be in the form of a helmet with a see-through shield, sunglasses, safety glasses, goggles, a mask, fire helmet with see-through shield, police helmet with see through shield, military helmet with see-through shield, utility form customized to a certain work task (e.g. inventory control, logistics, repair, maintenance, etc.), and the like.

[0076] The HWC **102** may also have a number of integrated computing facilities, such as an integrated processor, integrated power management, communication structures (e.g. cell net, WiFi, Bluetooth, local area connections, mesh connections, remote connections (e.g. client server, etc.)), and the like. The HWC **102** may also have a number of positional awareness sensors, such as GPS, electronic compass, altimeter, tilt sensor, IMU, and the like. It may also have other sensors such as a camera, rangefinder, hyper-spectral camera, Geiger counter, microphone, spectral illumination detector, temperature sensor, chemical sensor, biologic sensor, moisture sensor, ultrasonic sensor, and the like.

[0077] The HWC **102** may also have integrated control technologies. The integrated control technologies may be contextual based control, passive control, active control, user control, and the like. For example, the HWC **102** may have an integrated sensor (e.g. camera) that captures user hand or body gestures **116** such that the integrated processing system can interpret the gestures and generate control commands for the HWC **102**. In another example, the HWC **102** may have sensors that detect movement (e.g. a nod, head shake, and the

like) including accelerometers, gyros and other inertial measurements, where the integrated processor may interpret the movement and generate a control command in response. The HWC **102** may also automatically control itself based on measured or perceived environmental conditions. For example, if it is bright in the environment the HWC **102** may increase the brightness or contrast of the displayed image. In embodiments, the integrated control technologies may be mounted on the HWC **102** such that a user can interact with it directly. For example, the HWC **102** may have a button(s), touch capacitive interface, and the like.

[0078] As described herein, the HWC **102** may be in communication with external user interfaces **104**. The external user interfaces may come in many different forms. For example, a cell phone screen may be adapted to take user input for control of an aspect of the HWC **102**. The external user interface may be a dedicated UI, such as a keyboard, touch surface, button(s), joy stick, and the like. In embodiments, the external controller may be integrated into another device such as a ring, watch, bike, car, and the like. In each case, the external user interface **104** may include sensors (e.g. IMU, accelerometers, compass, altimeter, and the like) to provide additional input for controlling the HWC **102**.

[0079] As described herein, the HWC **102** may control or coordinate with other local devices **108**. The external devices **108** may be an audio device, visual device, vehicle, cell phone, computer, and the like. For instance, the local external device **108** may be another HWC **102**, where information may then be exchanged between the separate HWCs **108**.

[0080] Similar to the way the HWC **102** may control or coordinate with local devices **106**, the HWC **102** may control or coordinate with remote devices **112**, such as the HWC **102** communicating with the remote devices **112** through a network **110**. Again, the form of the remote device **112** may have many forms. Included in these forms is another HWC **102**. For example, each HWC **102** may communicate its GPS position such that all the HWCs **102** know where all of HWC **102** are located.

[0081] FIG. 2 illustrates a HWC **102** with an optical system that includes an upper optical module **202** and a lower optical module **204**. While the upper and lower optical modules **202** and **204** will generally be described as separate modules, it should be understood that this is illustrative only and the present invention includes other physical configurations, such as that when the two modules are combined into a single module or where the elements making up the two modules are configured into more than two modules. In embodiments, the upper module **202** includes a computer controlled display (e.g. LCoS, DLP, OLED, etc.) and image light delivery optics. In embodiments, the lower module includes eye delivery optics that are configured to receive the upper module's image light and deliver the image light to the eye of a wearer of the HWC. In FIG. 2, it should be noted that while the upper and lower optical modules **202** and **204** are illustrated in one side of the HWC such that image light can be delivered to one eye of the wearer, that it is envisioned by the present invention that embodiments will contain two image light delivery systems, one for each eye.

[0082] FIG. 3b illustrates an upper optical module **202** in accordance with the principles of the present invention. In this embodiment, the upper optical module **202** includes a DLP (also known as DMD or digital micromirror device) computer operated display **304** which includes pixels comprised of rotatable mirrors (such as, for example, the DLP3000 avail-

able from Texas Instruments), polarized light source **302**,  $\frac{1}{4}$ wave retarder film **308**, reflective polarizer **310** and a field lens **312**. The polarized light source **302** provides substantially uniform polarized light that is generally directed towards the reflective polarizer **310**. The reflective polarizer reflects light of one polarization state (e.g. S polarized light) and transmits light of the other polarization state (e.g. P polarized light). The polarized light source **302** and the reflective polarizer **310** are oriented so that the polarized light from the polarized light source **302** is reflected generally towards the DLP **304**. The light then passes through the  $\frac{1}{4}$ wave film **308** once before illuminating the pixels of the DLP **304** and then again after being reflected by the pixels of the DLP **304**. In passing through the  $\frac{1}{4}$ wave film **308** twice, the light is converted from one polarization state to the other polarization state (e.g. the light is converted from S to P polarized light). The light then passes through the reflective polarizer **310**. In the event that the DLP pixel(s) are in the “on” state (i.e. the mirrors are positioned to reflect light towards the field lens **312**, the “on” pixels reflect the light generally along the optical axis and into the field lens **312**. This light that is reflected by “on” pixels and which is directed generally along the optical axis of the field lens **312** will be referred to as image light **316**. The image light **316** then passes through the field lens to be used by a lower optical module **204**.

[0083] The light that is provided by the polarized light source **302**, which is subsequently reflected by the reflective polarizer **310** before it reflects from the DLP **304**, will generally be referred to as illumination light. The light that is reflected by the “off” pixels of the DLP **304** is reflected at a different angle than the light reflected by the “on” pixels, so that the light from the “off” pixels is generally directed away from the optical axis of the field lens **312** and toward the side of the upper optical module **202** as shown in FIG. 3. The light that is reflected by the “off” pixels of the DLP **304** will be referred to as dark state light **314**.

[0084] The DLP **304** operates as a computer controlled display and is generally thought of as a MEMs device. The DLP pixels are comprised of small mirrors that can be directed. The mirrors generally flip from one angle to another angle. The two angles are generally referred to as states. When light is used to illuminate the DLP the mirrors will reflect the light in a direction depending on the state. In embodiments herein, we generally refer to the two states as “on” and “off,” which is intended to depict the condition of a display pixel. “On” pixels will be seen by a viewer of the display as emitting light because the light is directed along the optical axis and into the field lens and the associated remainder of the display system. “Off” pixels will be seen by a viewer of the display as not emitting light because the light from these pixels is directed to the side of the optical housing and into a light trap or light dump where the light is absorbed. The pattern of “on” and “off” pixels produces image light that is perceived by a viewer of the display as a computer generated image. Full color images can be presented to a user by sequentially providing illumination light with complimentary colors such as red, green and blue. Where the sequence is presented in a recurring cycle that is faster than the user can perceive as separate images and as a result the user perceives a full color image comprised of the sum of the sequential images. Bright pixels in the image are provided by pixels that remain in the “on” state for the entire time of the cycle, while dimmer pixels in the image are provided by pixels that switch

between the “on” state and “off” state within the time of the cycle, or frame time when in a video sequence of images.

[0085] FIG. 3a shows an illustration of a system for a DLP **304** in which the unpolarized light source **350** is pointed directly at the DLP **304**. In this case, the angle required for the illumination light is such that the field lens **352** must be positioned substantially distant from the DLP **304** to avoid the illumination light from being clipped by the field lens **352**. The large distance between the field lens **352** and the DLP **304** along with the straight path of the dark state light **354**, means that the light trap for the dark state light **354** is also located at a substantial distance from the DLP. For these reasons, this configuration is larger in size compared to the upper optics module **202** of the preferred embodiments.

[0086] The configuration illustrated in FIG. 3b can be lightweight and compact such that it fits into a small portion of a HWC. For example, the upper modules **202** illustrated herein can be physically adapted to mount in an upper frame of a HWC such that the image light can be directed into a lower optical module **204** for presentation of digital content to a wearer’s eye. The package of components that combine to generate the image light (i.e. the polarized light source **302**, DLP **304**, reflective polarizer **310** and  $\frac{1}{4}$  wave film **308**) is very light and is compact. The height of the system, excluding the field lens, may be less than 8 mm. The width (i.e. from front to back) may be less than 8 mm. The weight may be less than 2 grams. The compactness of this upper optical module **202** allows for a compact mechanical design of the HWC and the light weight nature of these embodiments help make the HWC lightweight to provide for a HWC that is comfortable for a wearer of the HWC.

[0087] The configuration illustrated in FIG. 3b can produce sharp contrast, high brightness and deep blacks, especially when compared to LCD or LCoS displays used in HWC. The “on” and “off” states of the DLP provide for a strong differentiator in the light reflection path representing an “on” pixel and an “off” pixel. As will be discussed in more detail below, the dark state light from the “off” pixel reflections can be managed to reduce stray light in the display system to produce images with high contrast.

[0088] FIG. 4 illustrates another embodiment of an upper optical module **202** in accordance with the principles of the present invention. This embodiment includes a light source **404**, but in this case, the light source can provide unpolarized illumination light. The illumination light from the light source **404** is directed into a TIR wedge **418** such that the illumination light is incident on an internal surface of the TIR wedge **418** (shown as the angled lower surface of the TIR wedge **418** in FIG. 4) at an angle that is beyond the critical angle as defined by Eqn 1.

$$\text{Critical angle} = \arcsin(1/n)$$

Eqn 1

[0089] Where the critical angle is the angle beyond which the illumination light is reflected from the internal surface when the internal surface comprises an interface from a solid with a higher refractive index ( $n$ ) to air with a refractive index of 1 (e.g. for an interface of acrylic, with a refractive index of  $n=1.5$ , to air, the critical angle is 41.8 degrees; for an interface of polycarbonate, with a refractive index of  $n=1.59$ , to air the critical angle is 38.9 degrees). Consequently, the TIR wedge **418** is associated with a thin air gap **408** along the internal surface to create an interface between a solid with a higher refractive index and air. By choosing the angle of the light source **404** relative to the DLP **402** in correspondence to the

angle of the internal surface of the TIR wedge **418**, illumination light is turned toward the DLP **402** at an angle suitable for providing image light **414** as reflected from “on” pixels. Wherein, the illumination light is provided to the DLP **402** at approximately twice the angle of the pixel mirrors in the DLP **402** that are in the “on” state, such that after reflecting from the pixel mirrors, the image light **414** is directed generally along the optical axis of the field lens. Depending on the state of the DLP pixels, the illumination light from “on” pixels may be reflected as image light **414** which is directed towards a field lens and a lower optical module **204**, while illumination light reflected from “off” pixels (generally referred to herein as “dark” state light, “off” pixel light or “off” state light) **410** is directed in a separate direction, which may be trapped and not used for the image that is ultimately presented to the wearer’s eye.

[0090] The light trap for the dark state light **410** may be located along the optical axis defined by the direction of the dark state light **410** and in the side of the housing, with the function of absorbing the dark state light. To this end, the light trap may be comprised of an area outside of the cone of image light **414** from the “on” pixels. The light trap is typically made up of materials that absorb light including coatings of black paints or other light absorbing materials to prevent light scattering from the dark state light degrading the image perceived by the user. In addition, the light trap may be recessed into the wall of the housing or include masks or guards to block scattered light and prevent the light trap from being viewed adjacent to the displayed image.

[0091] The embodiment of FIG. 4 also includes a corrective wedge **420** to correct the effect of refraction of the image light **414** as it exits the TIR wedge **418**. By including the corrective wedge **420** and providing a thin air gap **408** (e.g. 25 micron), the image light from the “on” pixels can be maintained generally in a direction along the optical axis of the field lens (i.e. the same direction as that defined by the image light **414**) so it passes into the field lens and the lower optical module **204**. As shown in FIG. 4, the image light **414** from the “on” pixels exits the corrective wedge **420** generally perpendicular to the surface of the corrective wedge **420** while the dark state light exits at an oblique angle. As a result, the direction of the image light **414** from the “on” pixels is largely unaffected by refraction as it exits from the surface of the corrective wedge **420**. In contrast, the dark state light **410** is substantially changed in direction by refraction when the dark state light **410** exits the corrective wedge **420**.

[0092] The embodiment illustrated in FIG. 4 has the similar advantages of those discussed in connection with the embodiment of FIG. 3b. The dimensions and weight of the upper module **202** depicted in FIG. 4 may be approximately 8×8 mm with a weight of less than 3 grams. A difference in overall performance between the configuration illustrated in FIG. 3b and the configuration illustrated in FIG. 4 is that the embodiment of FIG. 4 doesn’t require the use of polarized light as supplied by the light source **404**. This can be an advantage in some situations as will be discussed in more detail below (e.g. increased see-through transparency of the HWC optics from the user’s perspective). Polarized light may be used in connection with the embodiment depicted in FIG. 4, in embodiments. An additional advantage of the embodiment of FIG. 4 compared to the embodiment shown in FIG. 3b is that the dark state light (shown as DLP off light **410**) is directed at a steeper angle away from the optical axis of the image light **414** due to the added refraction encountered when the dark state light

**410** exits the corrective wedge **420**. This steeper angle of the dark state light **410** allows for the light trap to be positioned closer to the DLP **402** so that the overall size of the upper module **202** can be reduced. The light trap can also be made larger since the light trap doesn’t interfere with the field lens, thereby the efficiency of the light trap can be increased and as a result, stray light can be reduced and the contrast of the image perceived by the user can be increased. FIG. 4a illustrates the embodiment described in connection with FIG. 4 with an example set of corresponding angles at the various surfaces with the reflected angles of a ray of light passing through the upper optical module **202**. In this example, the DLP mirrors are provided at 17 degrees to the surface of the DLP device. The angles of the TIR wedge are selected in correspondence to one another to provide TIR reflected illumination light at the correct angle for the DLP mirrors while allowing the image light and dark state light to pass through the thin air gap, various combinations of angles are possible to achieve this.

[0093] FIG. 5 illustrates yet another embodiment of an upper optical module **202** in accordance with the principles of the present invention. As with the embodiment shown in FIG. 4, the embodiment shown in FIG. 5 does not require the use of polarized light. Polarized light may be used in connection with this embodiment, but it is not required. The optical module **202** depicted in FIG. 5 is similar to that presented in connection with FIG. 4; however, the embodiment of FIG. 5 includes an off light redirection wedge **502**. As can be seen from the illustration, the off light redirection wedge **502** allows the image light **414** to continue generally along the optical axis toward the field lens and into the lower optical module **204** (as illustrated). However, the off light **504** is redirected substantially toward the side of the corrective wedge **420** where it passes into the light trap. This configuration may allow further height compactness in the HWC because the light trap (not illustrated) that is intended to absorb the off light **504** can be positioned laterally adjacent the upper optical module **202** as opposed to below it. In the embodiment depicted in FIG. 5 there is a thin air gap between the TIR wedge **418** and the corrective wedge **420** (similar to the embodiment of FIG. 4). There is also a thin air gap between the corrective wedge **420** and the off light redirection wedge **502**. There may be HWC mechanical configurations that warrant the positioning of a light trap for the dark state light elsewhere and the illustration depicted in FIG. 5 should be considered illustrative of the concept that the off light can be redirected to create compactness of the overall HWC. FIG. 5a illustrates an example of the embodiment described in connection with FIG. 5 with the addition of more details on the relative angles at the various surfaces and a light ray trace for image light and a light ray trace for dark light are shown as it passes through the upper optical module **202**. Again, various combinations of angles are possible.

[0094] FIG. 4b shows an illustration of a further embodiment in which a solid transparent matched set of wedges **456** is provided with a reflective polarizer **450** at the interface between the wedges. Wherein the interface between the wedges in the wedge set **456** is provided at an angle so that illumination light **452** from the polarized light source **458** is reflected at the proper angle (e.g. 34 degrees for a 17 degree DLP mirror) for the DLP mirror “on” state so that the reflected image light **414** is provided along the optical axis of the field lens. The general geometry of the wedges in the wedge set **456** is similar to that shown in FIGS. 4 and 4a. A

quarter wave film **454** is provided on the DLP **402** surface so that the illumination light **452** is one polarization state (e.g. S polarization state) while in passing through the quarter wave film **454**, reflecting from the DLP mirror and passing back through the quarter wave film **454**, the image light **414** is converted to the other polarization state (e.g. P polarization state). The reflective polarizer is oriented such that the illumination light **452** with its polarization state is reflected and the image light **414** with its other polarization state is transmitted. Since the dark state light from the “off” pixels **410** also passes through the quarter wave film **454** twice, it is also the other polarization state (e.g. P polarization state) so that it is transmitted by the reflective polarizer **450**.

[0095] The angles of the faces of the wedge set **450** correspond to the needed angles to provide illumination light **452** at the angle needed by the DLP mirrors when in the “on” state so that the reflected image light **414** is reflected from the DLP along the optical axis of the field lens. The wedge set **456** provides an interior interface where a reflective polarizer film can be located to redirect the illumination light **452** toward the mirrors of the DLP **402**. The wedge set also provides a matched wedge on the opposite side of the reflective polarizer **450** so that the image light **414** from the “on” pixels exits the wedge set **450** substantially perpendicular to the exit surface, while the dark state light from the “off” pixels **410** exits at an oblique angle to the exit surface. As a result, the image light **414** is substantially unrefracted upon exiting the wedge set **456**, while the dark state light from the “off” pixels **410** is substantially refracted upon exiting the wedge set **456** as shown in FIG. **4b**.

[0096] By providing a solid transparent matched wedge set, the flatness of the interface is reduced, because variations in the flatness have a negligible effect as long as they are within the cone angle of the illuminating light **452**. Which can be f#2.2 with a 26 degree cone angle. In a preferred embodiment, the reflective polarizer is bonded between the matched internal surfaces of the wedge set **456** using an optical adhesive so that Fresnel reflections at the interfaces on either side of the reflective polarizer **450** are reduced. The optical adhesive can be matched in refractive index to the material of the wedge set **456** and the pieces of the wedge set **456** can be all made from the same material such as BK7 glass or cast acrylic. Wherein the wedge material can be selected to have low birefringence as well to reduce non-uniformities in brightness. The wedge set **456** and the quarter wave film **454** can also be bonded to the DLP **402** to further reduce Fresnel reflections at the DLP interface losses. In addition, since the image light **414** is substantially normal to the exit surface of the wedge set **456**, the flatness of the surface is not critical to maintain the wavefront of the image light **414** so that high image quality can be obtained in the displayed image without requiring very tightly toleranced flatness on the exit surface.

[0097] A yet further embodiment of the invention that is not illustrated, combines the embodiments illustrated in FIG. **4b** and FIG. **5**. In this embodiment, the wedge set **456** is comprised of three wedges with the general geometry of the wedges in the wedge set corresponding to that shown in FIGS. **5** and **5a**. A reflective polarizer is bonded between the first and second wedges similar to that shown in FIG. **4b**, however, a third wedge is provided similar to the embodiment of FIG. **5**. Wherein there is an angled thin air gap between the second and third wedges so that the dark state light is reflected by TIR toward the side of the second wedge where it is absorbed in a light trap. This embodiment, like the embodiment shown in

FIG. **4b**, uses a polarized light source as has been previously described. The difference in this embodiment is that the image light is transmitted through the reflective polarizer and is transmitted through the angled thin air gap so that it exits normal to the exit surface of the third wedge.

[0098] FIG. **5b** illustrates an upper optical module **202** with a dark light trap **514a**. As described in connection with FIGS. **4** and **4a**, image light can be generated from a DLP when using a TIR and corrective lens configuration. The upper module may be mounted in a HWC housing **510** and the housing **510** may include a dark light trap **514a**. The dark light trap **514a** is generally positioned/constructed/formed in a position that is optically aligned with the dark light optical axis **512**. As illustrated, the dark light trap may have depth such that the trap internally reflects dark light in an attempt to further absorb the light and prevent the dark light from combining with the image light that passes through the field lens. The dark light trap may be of a shape and depth such that it absorbs the dark light. In addition, the dark light trap **514b**, in embodiments, may be made of light absorbing materials or coated with light absorbing materials. In embodiments, the recessed light trap **514a** may include baffles to block a view of the dark state light. This may be combined with black surfaces and textured or fibrous surfaces to help absorb the light. The baffles can be part of the light trap, associated with the housing, or field lens, etc.

[0099] FIG. **5c** illustrates another embodiment with a light trap **514b**. As can be seen in the illustration, the shape of the trap is configured to enhance internal reflections within the light trap **514b** to increase the absorption of the dark light **512**. FIG. **5d** illustrates another embodiment with a light trap **514c**. As can be seen in the illustration, the shape of the trap **514c** is configured to enhance internal reflections to increase the absorption of the dark light **512**.

[0100] FIG. **5e** illustrates another embodiment of an upper optical module **202** with a dark light trap **514d**. This embodiment of upper module **202** includes an off light reflection wedge **502**, as illustrated and described in connection with the embodiment of FIGS. **5** and **5a**. As can be seen in FIG. **5e**, the light trap **514d** is positioned along the optical path of the dark light **512**. The dark light trap **514d** may be configured as described in other embodiments herein. The embodiment of the light trap **514d** illustrated in FIG. **5e** includes a black area on the side wall of the wedge, wherein the side wall is located substantially away from the optical axis of the image light **414**. In addition, baffles **525** may be added to one or more edges of the field lens **312** to block the view of the light trap **514d** adjacent to the displayed image seen by the user.

[0101] FIG. **6** illustrates a combination of an upper optical module **202** with a lower optical module **204**. In this embodiment, the image light projected from the upper optical module **202** may or may not be polarized. The image light is reflected off a flat combiner element **602** such that it is directed towards the user's eye. Wherein, the combiner element **602** is a partial mirror that reflects image light while transmitting a substantial portion of light from the environment so the user can look through the combiner element and see the environment surrounding the HWC.

[0102] The combiner **602** may include a holographic pattern, to form a holographic mirror. If a monochrome image is desired, there may be a single wavelength reflection design for the holographic pattern on the surface of the combiner **602**. If the intention is to have multiple colors reflected from the surface of the combiner **602**, a multiple wavelength holo-

graphic mirror may be included on the combiner surface. For example, in a three-color embodiment, where red, green and blue pixels are generated in the image light, the holographic mirror may be reflective to wavelengths substantially matching the wavelengths of the red, green and blue light provided by the light source. This configuration can be used as a wavelength specific mirror where pre-determined wavelengths of light from the image light are reflected to the user's eye. This configuration may also be made such that substantially all other wavelengths in the visible pass through the combiner element **602** so the user has a substantially clear view of the surroundings when looking through the combiner element **602**. The transparency between the user's eye and the surrounding may be approximately 80% when using a combiner that is a holographic mirror. Wherein holographic mirrors can be made using lasers to produce interference patterns in the holographic material of the combiner where the wavelengths of the lasers correspond to the wavelengths of light that are subsequently reflected by the holographic mirror.

**[0103]** In another embodiment, the combiner element **602** may include a notch mirror comprised of a multilayer coated substrate wherein the coating is designed to substantially reflect the wavelengths of light provided by the light source and substantially transmit the remaining wavelengths in the visible spectrum. For example, in the case where red, green and blue light is provided by the light source to enable full color images to be provided to the user, the notch mirror is a tristimulus notch mirror wherein the multilayer coating is designed to reflect narrow bands of red, green and blue light that are matched to the what is provided by the light source and the remaining visible wavelengths are transmitted through the coating to enable a view of the environment through the combiner. In another example where monochrome images are provided to the user, the notch mirror is designed to reflect a single narrow band of light that is matched to the wavelength range of the light provided by the light source while transmitting the remaining visible wavelengths to enable a see-thru view of the environment. The combiner **602** with the notch mirror would operate, from the user's perspective, in a manner similar to the combiner that includes a holographic pattern on the combiner element **602**. The combiner, with the tristimulus notch mirror, would reflect the "on" pixels to the eye because of the match between the reflective wavelengths of the notch mirror and the color of the image light, and the wearer would be able to see with high clarity the surroundings. The transparency between the user's eye and the surrounding may be approximately 80% when using the tristimulus notch mirror. In addition, the image provided by the upper optical module **202** with the notch mirror combiner can provide higher contrast images than the holographic mirror combiner due to less scattering of the imaging light by the combiner.

**[0104]** Light can escape through the combiner **602** and may produce face glow as the light is generally directed downward onto the cheek of the user. When using a holographic mirror combiner or a tristimulus notch mirror combiner, the escaping light can be trapped to avoid face glow. In embodiments, if the image light is polarized before the combiner, a linear polarizer can be laminated, or otherwise associated, to the combiner, with the transmission axis of the polarizer oriented relative to the polarized image light so that any escaping image light is absorbed by the polarizer. In embodiments, the image light would be polarized to provide S polarized light to the combiner for better reflection. As a result, the linear polar-

izer on the combiner would be oriented to absorb S polarized light and pass P polarized light. This provides the preferred orientation of polarized sunglasses as well.

**[0105]** If the image light is unpolarized, a microlouvered film such as a privacy filter can be used to absorb the escaping image light while providing the user with a see-thru view of the environment. In this case, the absorbance or transmittance of the microlouvered film is dependent on the angle of the light. Where steep angle light is absorbed and light at less of an angle is transmitted. For this reason, in an embodiment, the combiner with the microlouver film is angled at greater than 45 degrees to the optical axis of the image light (e.g. the combiner can be oriented at 50 degrees so the image light from the file lens is incident on the combiner at an oblique angle).

**[0106]** FIG. 7 illustrates an embodiment of a combiner element **602** at various angles when the combiner element **602** includes a holographic mirror. Normally, a mirrored surface reflects light at an angle equal to the angle that the light is incident to the mirrored surface. Typically, this necessitates that the combiner element be at 45 degrees, **602a**, if the light is presented vertically to the combiner so the light can be reflected horizontally towards the wearer's eye. In embodiments, the incident light can be presented at angles other than vertical to enable the mirror surface to be oriented at other than 45 degrees, but in all cases wherein a mirrored surface is employed (including the tristimulus notch mirror described previously), the incident angle equals the reflected angle. As a result, increasing the angle of the combiner **602a** requires that the incident image light be presented to the combiner **602a** at a different angle which positions the upper optical module **202** to the left of the combiner as shown in FIG. 7. In contrast, a holographic mirror combiner, included in embodiments, can be made such that light is reflected at a different angle from the angle that the light is incident onto the holographic mirrored surface. This allows freedom to select the angle of the combiner element **602b** independent of the angle of the incident image light and the angle of the light reflected into the wearer's eye. In embodiments, the angle of the combiner element **602b** is greater than 45 degrees (shown in FIG. 7) as this allows a more laterally compact HWC design. The increased angle of the combiner element **602b** decreases the front to back width of the lower optical module **204** and may allow for a thinner HWC display (i.e. the furthest element from the wearer's eye can be closer to the wearer's face).

**[0107]** FIG. 8 illustrates another embodiment of a lower optical module **204**. In this embodiment, polarized image light provided by the upper optical module **202**, is directed into the lower optical module **204**. The image light reflects off a polarized mirror **804** and is directed to a focusing partially reflective mirror **802**, which is adapted to reflect the polarized light. An optical element such as a  $\frac{1}{4}$ wave film located between the polarized mirror **804** and the partially reflective mirror **802**, is used to change the polarization state of the image light such that the light reflected by the partially reflective mirror **802** is transmitted by the polarized mirror **804** to present image light to the eye of the wearer. The user can also see through the polarized mirror **804** and the partially reflective mirror **802** to see the surrounding environment. As a result, the user perceives a combined image comprised of the displayed image light overlaid onto the see-thru view of the environment.

**[0108]** While many of the embodiments of the present invention have been referred to as upper and lower modules

containing certain optical components, it should be understood that the image light and dark light production and management functions described in connection with the upper module may be arranged to direct light in other directions (e.g. upward, sideward, etc.). In embodiments, it may be preferred to mount the upper module **202** above the wearer's eye, in which case the image light would be directed downward. In other embodiments it may be preferred to produce light from the side of the wearer's eye, or from below the wearer's eye. In addition, the lower optical module is generally configured to deliver the image light to the wearer's eye and allow the wearer to see through the lower optical module, which may be accomplished through a variety of optical components.

**[0109]** FIG. **8a** illustrates an embodiment of the present invention where the upper optical module **202** is arranged to direct image light into a TIR waveguide **810**. In this embodiment, the upper optical module **202** is positioned above the wearer's eye **812** and the light is directed horizontally into the TIR waveguide **810**. The TIR waveguide is designed to internally reflect the image light in a series of downward TIR reflections until it reaches the portion in front of the wearer's eye, where the light passes out of the TIR waveguide **812** into the wearer's eye. In this embodiment, an outer shield **814** is positioned in front of the TIR waveguide **810**.

**[0110]** FIG. **8b** illustrates an embodiment of the present invention where the upper optical module **202** is arranged to direct image light into a TIR waveguide **818**. In this embodiment, the upper optical module **202** is arranged on the side of the TIR waveguide **818**. For example, the upper optical module may be positioned in the arm or near the arm of the HWC when configured as a pair of head worn glasses. The TIR waveguide **818** is designed to internally reflect the image light in a series of TIR reflections until it reaches the portion in front of the wearer's eye, where the light passes out of the TIR waveguide **812** into the wearer's eye.

**[0111]** FIG. **8c** illustrates yet further embodiments of the present invention where an upper optical module **202** is directing polarized image light into an optical guide **828** where the image light passes through a polarized reflector **824**, changes polarization state upon reflection of the optical element **822** which includes a  $\frac{1}{4}$ wave film for example and then is reflected by the polarized reflector **824** towards the wearer's eye, due to the change in polarization of the image light. The upper optical module **202** may be positioned to direct light to a mirror **820**, to position the upper optical module **202** laterally, in other embodiments, the upper optical module **202** may direct the image light directly towards the polarized reflector **824**. It should be understood that the present invention comprises other optical arrangements intended to direct image light into the wearer's eye.

**[0112]** Another aspect of the present invention relates to eye imaging. In embodiments, a camera is used in connection with an upper optical module **202** such that the wearer's eye can be imaged using pixels in the "off" state on the DLP. FIG. **9** illustrates a system where the eye imaging camera **802** is mounted and angled such that the field of view of the eye imaging camera **802** is redirected toward the wearer's eye by the mirror pixels of the DLP **402** that are in the "off" state. In this way, the eye imaging camera **802** can be used to image the wearer's eye along the same optical axis as the displayed image that is presented to the wearer. Wherein, image light that is presented to the wearer's eye illuminates the wearer's eye so that the eye can be imaged by the eye imaging camera

**802**. In the process, the light reflected by the eye passes back through the optical train of the lower optical module **204** and a portion of the upper optical module to where the light is reflected by the "off" pixels of the DLP **402** toward the eye imaging camera **802**.

**[0113]** In embodiments, the eye imaging camera may image the wearer's eye at a moment in time where there are enough "off" pixels to achieve the required eye image resolution. In another embodiment, the eye imaging camera collects eye image information from "off" pixels over time and forms a time lapsed image. In another embodiment, a modified image is presented to the user wherein enough "off" state pixels are included that the camera can obtain the desired resolution and brightness for imaging the wearer's eye and the eye image capture is synchronized with the presentation of the modified image.

**[0114]** The eye imaging system may be used for security systems. The HWC may not allow access to the HWC or other system if the eye is not recognized (e.g. through eye characteristics including retina or iris characteristics, etc.). The HWC may be used to provide constant security access in some embodiments. For example, the eye security confirmation may be a continuous, near-continuous, real-time, quasi real-time, periodic, etc. process so the wearer is effectively constantly being verified as known. In embodiments, the HWC may be worn and eye security tracked for access to other computer systems.

**[0115]** The eye imaging system may be used for control of the HWC. For example, a blink, wink, or particular eye movement may be used as a control mechanism for a software application operating on the HWC or associated device.

**[0116]** The eye imaging system may be used in a process that determines how or when the HWC **102** delivers digitally displayed content to the wearer. For example, the eye imaging system may determine that the user is looking in a direction and then HWC may change the resolution in an area of the display or provide some content that is associated with something in the environment that the user may be looking at. Alternatively, the eye imaging system may identify different user's and change the displayed content or enabled features provided to the user. User's may be identified from a database of users eye characteristics either located on the HWC **102** or remotely located on the network **110** or on a server **112**. In addition, the HWC may identify a primary user or a group of primary users from eye characteristics wherein the primary user(s) are provided with an enhanced set of features and all other user's are provided with a different set of features. Thus in this use case, the HWC **102** uses identified eye characteristics to either enable features or not and eye characteristics need only be analyzed in comparison to a relatively small database of individual eye characteristics.

**[0117]** FIG. **10** illustrates a light source that may be used in association with the upper optics module **202** (e.g. polarized light source if the light from the solid state light source is polarized such as polarized light source **302** and **458**), and light source **404**. In embodiments, to provide a uniform surface of light **1008** to be directed into the upper optical module **202** and towards the DLP of the upper optical module, either directly or indirectly, the solid state light source **1002** may be projected into a backlighting optical system **1004**. The solid state light source **1002** may be one or more LEDs, laser diodes, OLEDs. In embodiments, the backlighting optical system **1004** includes an extended section with a length/distance ratio of greater than 3, wherein the light undergoes

multiple reflections from the sidewalls to mix or homogenize the light as supplied by the solid state light source **1002**. The backlighting optical system **1004** can also include structures on the surface opposite (on the left side as shown in FIG. **10**) to where the uniform light **1008** exits the backlight **1004** to change the direction of the light toward the DLP **302** and the reflective polarizer **310** or the DLP **402** and the TIR wedge **418**. The backlighting optical system **1004** may also include structures to collimate the uniform light **1008** to provide light to the DLP with a smaller angular distribution or narrower cone angle. Diffusers or polarizers can be used on the entrance or exit surface of the backlighting optical system. Diffusers can be used to spread or uniformize the exiting light from the backlight to improve the uniformity or increase the angular spread of the uniform light **1008**. Elliptical diffusers that diffuse the light more in some directions and less in others can be used to improve the uniformity or spread of the uniform light **1008** in directions orthogonal to the optical axis of the uniform light **1008**. Linear polarizers can be used to convert unpolarized light as supplied by the solid state light source **1002** to polarized light so the uniform light **1008** is polarized with a desired polarization state. A reflective polarizer can be used on the exit surface of the backlight **1004** to polarize the uniform light **1008** to the desired polarization state, while reflecting the other polarization state back into the backlight where it is recycled by multiple reflections within the backlight **1004** and at the solid state light source **1002**. Therefore by including a reflective polarizer at the exit surface of the backlight **1004**, the efficiency of the polarized light source is improved.

[0118] FIGS. **10a** and **10b** show illustrations of structures in backlight optical systems **1004** that can be used to change the direction of the light provided to the entrance face **1045** by the light source and then collimates the light in a direction lateral to the optical axis of the exiting uniform light **1008**. Structure **1060** includes an angled sawtooth pattern in a transparent waveguide wherein the left edge of each sawtooth clips the steep angle rays of light thereby limiting the angle of the light being redirected. The steep surface at the right (as shown) of each sawtooth then redirects the light so that it reflects off the left angled surface of each sawtooth and is directed toward the exit surface **1040**. The sawtooth surfaces shown on the lower surface in FIGS. **10a** and **10b**, can be smooth and coated (e.g. with an aluminum coating or a dielectric mirror coating) to provide a high level of reflectivity without scattering. Structure **1050** includes a curved face on the left side (as shown) to focus the rays after they pass through the exit surface **1040**, thereby providing a mechanism for collimating the uniform light **1008**. In a further embodiment, a diffuser can be provided between the solid state light source **1002** and the entrance face **1045** to homogenize the light provided by the solid state light source **1002**. In yet a further embodiment, a polarizer can be used between the diffuser and the entrance face **1045** of the backlight **1004** to provide a polarized light source. Because the sawtooth pattern provides smooth reflective surfaces, the polarization state of the light can be preserved from the entrance face **1045** to the exit face **1040**. In this embodiment, the light entering the backlight from the solid state light source **1002** passes through the polarizer so that it is polarized with the desired polarization state. If the polarizer is an absorptive linear polarizer, the light of the desired polarization state is transmitted while the light of the other polarization state is absorbed. If the polarizer is a reflective polarizer, the light of

the desired polarization state is transmitted into the backlight **1004** while the light of the other polarization state is reflected back into the solid state light source **1002** where it can be recycled as previously described, to increase the efficiency of the polarized light source.

[0119] FIG. **11a** illustrates a light source **1100** that may be used in association with the upper optics module **202**. In embodiments, the light source **1100** may provide light to a backlighting optical system **1004** as described above in connection with FIG. **10**. In embodiments, the light source **1100** includes a tristimulus notch filter **1102**. The tristimulus notch filter **1102** has narrow band pass filters for three wavelengths, as indicated in FIG. **11c** in a transmission graph **1108**. The graph shown in FIG. **11b**, as **1104** illustrates an output of three different colored LEDs. One can see that the bandwidths of emission are narrow, but they have long tails. The tristimulus notch filter **1102** can be used in connection with such LEDs to provide a light source **1100** that emits narrow filtered wavelengths of light as shown in FIG. **11d** as the transmission graph **1110**. Wherein the clipping effects of the tristimulus notch filter **1102** can be seen to have cut the tails from the LED emission graph **1104** to provide narrower wavelength bands of light to the upper optical module **202**. The light source **1100** can be used in connection with a combiner **602** with a holographic mirror or tristimulus notch mirror to provide narrow bands of light that are reflected toward the wearer's eye with less waste light that does not get reflected by the combiner, thereby improving efficiency and reducing escaping light that can cause faceglow.

[0120] FIG. **12a** illustrates another light source **1200** that may be used in association with the upper optics module **202**. In embodiments, the light source **1200** may provide light to a backlighting optical system **1004** as described above in connection with FIG. **10**. In embodiments, the light source **1200** includes a quantum dot cover glass **1202**. Where the quantum dots absorb light of a shorter wavelength and emit light of a longer wavelength (FIG. **12b** shows an example wherein a UV spectrum **1202** applied to a quantum dot results in the quantum dot emitting a narrow band shown as a PL spectrum **1204**) that is dependent on the material makeup and size of the quantum dot. As a result, quantum dots in the quantum dot cover glass **1202** can be tailored to provide one or more bands of narrow bandwidth light (e.g. red, green and blue emissions dependent on the different quantum dots included as illustrated in the graph shown in FIG. **12c** where three different quantum dots are used. In embodiments, the LED driver light emits UV light, deep blue or blue light. For sequential illumination of different colors, multiple light sources **1200** would be used where each light source **1200** would include a quantum dot cover glass **1202** with a quantum dot selected to emit at one of the desired colors. The light source **1100** can be used in connection with a combiner **602** with a holographic mirror or tristimulus notch mirror to provide narrow transmission bands of light that are reflected toward the wearer's eye with less waste light that does not get reflected.

[0121] Another aspect of the present invention relates to the generation of peripheral image lighting effects for a person wearing a HWC. In embodiments, a solid state lighting system (e.g. LED, OLED, etc), or other lighting system, may be included inside the optical elements of an lower optical module **204**. The solid state lighting system may be arranged such that lighting effects outside of a field of view (FOV) of the presented digital content is presented to create an emersive effect for the person wearing the HWC. To this end, the

lighting effects may be presented to any portion of the HWC that is visible to the wearer. The solid state lighting system may be digitally controlled by an integrated processor on the HWC. In embodiments, the integrated processor will control the lighting effects in coordination with digital content that is presented within the FOV of the HWC. For example, a movie, picture, game, or other content, may be displayed or playing within the FOV of the HWC. The content may show a bomb blast on the right side of the FOV and at the same moment, the solid state lighting system inside of the upper module optics may flash quickly in concert with the FOV image effect. The effect may not be fast, it may be more persistent to indicate, for example, a general glow or color on one side of the user. The solid state lighting system may be color controlled, with red, green and blue LEDs, for example, such that color control can be coordinated with the digitally presented content within the field of view.

[0122] FIG. 13a illustrates optical components of a lower optical module 204 together with an outer lens 1302. FIG. 13a also shows an embodiment including effects LED's 1308a and 1308b. FIG. 13a illustrates image light 1312, as described herein elsewhere, directed into the upper optical module where it will reflect off of the combiner element 1304, as described herein elsewhere. The combiner element 1304 in this embodiment is angled towards the wearer's eye at the top of the module and away from the wearer's eye at the bottom of the module, as also illustrated and described in connection with FIG. 8 (e.g. at a 45 degree angle). The image light 1312 provided by an upper optical module 202 (not shown in FIG. 13a) reflects off of the combiner element 1304 towards the collimating mirror 1310, away from the wearer's eye, as described herein elsewhere. The image light 1312 then reflects and focuses off of the collimating mirror 1304, passes back through the combiner element 1304, and is directed into the wearer's eye. The wearer can also view the surrounding environment through the transparency of the combiner element 1304, collimating mirror 1310, and outer lens 1302 (if it is included). As described herein elsewhere, various surfaces are polarized to create the optical path for the image light and to provide transparency of the elements such that the wearer can view the surrounding environment. The wearer will generally perceive that the image light forms an image in the FOV 1305. In embodiments, the outer lens 1302 may be included. The outer lens 1302 is an outer lens that may or may not be corrective and it may be designed to conceal the lower optical module components in an effort to make the HWC appear to be in a form similar to standard glasses or sunglasses.

[0123] In the embodiment illustrated in FIG. 13a, the effects LEDs 1308a and 1308b are positioned at the sides of the combiner element 1304 and the outer lens 1302 and/or the collimating mirror 1310. In embodiments, the effects LEDs 1308a are positioned within the confines defined by the combiner element 1304 and the outer lens 1302 and/or the collimating mirror. The effects LEDs 1308a and 1308b are also positioned outside of the FOV 1305. In this arrangement, the effects LEDs 1308a and 1308b can provide lighting effects within the lower optical module outside of the FOV 1305. In embodiments the light emitted from the effects LEDs 1308a and 1308b may be polarized such that the light passes through the combiner element 1304 toward the wearer's eye and does not pass through the outer lens 1302 and/or the collimating mirror 1310. This arrangement provides peripheral lighting effects to the wearer in a more private setting by not transmitting the lighting effects through the front of the HWC into

the surrounding environment. However, in other embodiments, the effects LEDs 1308a and 1308b may be unpolarized so the lighting effects provided are made to be purposefully viewable by others in the environment for entertainment such as giving the effect of the wearer's eye glowing in correspondence to the image content being viewed by the wearer.

[0124] FIG. 13b illustrates a cross section of the embodiment described in connection with FIG. 13a. As illustrated, the effects LED 1308a is located in the upper-front area inside of the optical components of the lower optical module. It should be understood that the effects LED 1308a position in the described embodiments is only illustrative and alternate placements are encompassed by the present invention. Additionally, in embodiments, there may be one or more effects LEDs 1308a in each of the two sides of HWC to provide peripheral lighting effects near one or both eyes of the wearer.

[0125] FIG. 13c illustrates an embodiment where the combiner element 1304 is angled away from the eye at the top and towards the eye at the bottom (e.g. in accordance with the holographic or notch filter embodiments described herein). In this embodiment, the effects LED 1308a is located on the outer lens 1302 side of the combiner element 1304 to provide a concealed appearance of the lighting effects. As with other embodiments, the effects LED 1308a of FIG. 13c may include a polarizer such that the emitted light can pass through a polarized element associated with the combiner element 1304 and be blocked by a polarized element associated with the outer lens 1302.

[0126] Another aspect of the present invention relates to the mitigation of light escaping from the space between the wearer's face and the HWC itself. Another aspect of the present invention relates to maintaining a controlled lighting environment in proximity to the wearer's eyes. In embodiments, both the maintenance of the lighting environment and the mitigation of light escape are accomplished by including a removable and replaceable flexible shield for the HWC. Wherein the removable and replaceable shield can be provided for one eye or both eyes in correspondence to the use of the displays for each eye. For example, in a night vision application, the display to only one eye could be used for night vision while the display to the other eye is turned off to provide good see-thru when moving between areas where visible light is available and dark areas where night vision enhancement is needed.

[0127] FIG. 14a illustrates a removable and replaceable flexible eye cover 1402 with an opening 1408 that can be attached and removed quickly from the HWC 102 through the use of magnets. Other attachment methods may be used, but for illustration of the present invention we will focus on a magnet implementation. In embodiments, magnets may be included in the eye cover 1402 and magnets of an opposite polarity may be included (e.g. embedded) in the frame of the HWC 102. The magnets of the two elements would attract quite strongly with the opposite polarity configuration. In another embodiment, one of the elements may have a magnet and the other side may have metal for the attraction. In embodiments, the eye cover 1402 is a flexible elastomeric shield. In embodiments, the eye cover 1402 may be an elastomeric bellows design to accommodate flexibility and more closely align with the wearer's face. FIG. 14b illustrates a removable and replaceable flexible eye cover 1404 that is adapted as a single eye cover. In embodiments, a single eye cover may be used for each side of the HWC to cover both

eyes of the wearer. In embodiments, the single eye cover may be used in connection with a HWC that includes only one computer display for one eye. These configurations prevent light that is generated and directed generally towards the wearer's face by covering the space between the wearer's face and the HWC. The opening 1408 allows the wearer to look through the opening 1408 to view the displayed content and the surrounding environment through the front of the HWC. The image light in the lower optical module 204 can be prevented from emitting from the front of the HWC through internal optics polarization schemes, as described herein, for example.

[0128] FIG. 14c illustrates another embodiment of a light suppression system. In this embodiment, the eye cover 1410 may be similar to the eye cover 1402, but eye cover 1410 includes a front light shield 1412. The front light shield 1412 may be opaque to prevent light from escaping the front lens of the HWC. In other embodiments, the front light shield 1412 is polarized to prevent light from escaping the front lens. In a polarized arrangement, in embodiments, the internal optical elements of the HWC (e.g. of the lower optical module 204) may polarize light transmitted towards the front of the HWC and the front light shield 1412 may be polarized to prevent the light from transmitting through the front light shield 1412.

[0129] In embodiments, an opaque front light shield 1412 may be included and the digital content may include images of the surrounding environment such that the wearer can visualize the surrounding environment. One eye may be presented with night vision environmental imagery and this eye's surrounding environment optical path may be covered using an opaque front light shield 1412. In other embodiments, this arrangement may be associated with both eyes.

[0130] Another aspect of the present invention relates to automatically configuring the lighting system(s) used in the HWC 102. In embodiments, the display lighting and/or effects lighting, as described herein, may be controlled in a manner suitable for when an eye cover 1408 is attached or removed from the HWC 102. For example, at night, when the light in the environment is low, the lighting system(s) in the HWC may go into a low light mode to further control any amounts of stray light escaping from the HWC and the areas around the HWC. Covert operations at night, while using night vision or standard vision, may require a solution which prevents as much escaping light as possible so a user may clip on the eye cover(s) 1408 and then the HWC may go into a low light mode. The low light mode may, in some embodiments, only go into a low light mode when the eye cover 1408 is attached if the HWC identifies that the environment is in low light conditions (e.g. through environment light level sensor detection). In embodiments, the low light level may be determined to be at an intermediate point between full and low light dependent on environmental conditions.

[0131] Another aspect of the present invention relates to automatically controlling the type of content displayed in the HWC when eye covers 1408 are attached or removed from the HWC. In embodiments, when the eye cover(s) 1408 is attached to the HWC, the displayed content may be restricted in amount or in color amounts. For example, the display(s) may go into a simple content delivery mode to restrict the amount of information displayed. This may be done to reduce the amount of light produced by the display(s). In an embodiment, the display(s) may change from color displays to monochrome displays to reduce the amount of light produced. In an

embodiment, the monochrome lighting may be red to limit the impact on the wearer's eyes to maintain an ability to see better in the dark.

[0132] Referring to FIG. 15, we now turn to describe a particular external user interface 104, referred to generally as a pen 1500. The pen 1500 is a specially designed external user interface 104 and can operate as a user interface, such as to many different styles of HWC 102. The pen 1500 generally follows the form of a conventional pen, which is a familiar user handled device and creates an intuitive physical interface for many of the operations to be carried out in the HWC system 100. The pen 1500 may be one of several user interfaces 104 used in connection with controlling operations within the HWC system 100. For example, the HWC 102 may watch for and interpret hand gestures 116 as control signals, where the pen 1500 may also be used as a user interface with the same HWC 102. Similarly, a remote keyboard may be used as an external user interface 104 in concert with the pen 1500. The combination of user interfaces or the use of just one control system generally depends on the operation(s) being executed in the HWC's system 100.

[0133] While the pen 1500 may follow the general form of a conventional pen, it contains numerous technologies that enable it to function as an external user interface 104. FIG. 15 illustrates technologies comprised in the pen 1500. As can be seen, the pen 1500 may include a camera 1508, which is arranged to view through lens 1502. The camera may then be focused, such as through lens 1502, to image a surface upon which a user is writing or making other movements to interact with the HWC 102. There are situations where the pen 1500 will also have an ink, graphite, or other system such that what is being written can be seen on the writing surface. There are other situations where the pen 1500 does not have such a physical writing system so there is no deposit on the writing surface, where the pen would only be communicating data or commands to the HWC 102. The lens configuration is described in greater detail herein. The function of the camera is to capture information from an unstructured writing surface such that pen strokes can be interpreted as intended by the user. To assist in the predication of the intended stroke path, the pen 1500 may include a sensor, such as an IMU 1512. Of course, the IMU could be included in the pen 1500 in its separate parts (e.g. gyro, accelerometer, etc.) or an IMU could be included as a single unit. In this instance, the IMU 1512 is used to measure and predict the motion of the pen 1500. In turn, the integrated microprocessor 1510 would take the IMU information and camera information as inputs and process the information to form a prediction of the pen tip movement.

[0134] The pen 1500 may also include a pressure monitoring system 1504, such as to measure the pressure exerted on the lens 1502. As will be described in greater detail herein, the pressure measurement can be used to predict the user's intention for changing the weight of a line, type of a line, type of brush, click, double click, and the like. In embodiments, the pressure sensor may be constructed using any force or pressure measurement sensor located behind the lens 1502, including for example, a resistive sensor, a current sensor, a capacitive sensor, a voltage sensor such as a piezoelectric sensor, and the like.

[0135] The pen 1500 may also include a communications module 1518, such as for bi-directional communication with the HWC 102. In embodiments, the communications module 1518 may be a short distance communication module (e.g. Bluetooth). The communications module 1518 may be secu-

rity matched to the HWC 102. The communications module 1518 may be arranged to communicate data and commands to and from the microprocessor 1510 of the pen 1500. The microprocessor 1510 may be programmed to interpret data generated from the camera 1508, IMU 1512, and pressure sensor 1504, and the like, and then pass a command onto the HWC 102 through the communications module 1518, for example. In another embodiment, the data collected from any of the input sources (e.g. camera 1508, IMU 1512, pressure sensor 1504) by the microprocessor may be communicated by the communication module 1518 to the HWC 102, and the HWC 102 may perform data processing and prediction of the user's intention when using the pen 1500. In yet another embodiment, the data may be further passed on through a network 110 to a remote device 112, such as a server, for the data processing and prediction. The commands may then be communicated back to the HWC 102 for execution (e.g. display writing in the glasses display, make a selection within the UI of the glasses display, control a remote external device 112, control a local external device 108), and the like. The pen may also include memory 1514 for long or short term uses.

[0136] The pen 1500 may also include a number of physical user interfaces, such as quick launch buttons 1522, a touch sensor 1520, and the like. The quick launch buttons 1522 may be adapted to provide the user with a fast way of jumping to a software application in the HWC system 100. For example, the user may be a frequent user of communication software packages (e.g. email, text, Twitter, Instagram, Facebook, Google+, and the like), and the user may program a quick launch button 1522 to command the HWC 102 to launch an application. The pen 1500 may be provided with several quick launch buttons 1522, which may be user programmable or factory programmable. The quick launch button 1522 may be programmed to perform an operation. For example, one of the buttons may be programmed to clear the digital display of the HWC 102. This would create a fast way for the user to clear the screens on the HWC 102 for any reason, such as for example to better view the environment. The quick launch button functionality will be discussed in further detail below. The touch sensor 1520 may be used to take gesture style input from the user. For example, the user may be able to take a single finger and run it across the touch sensor 1520 to affect a page scroll.

[0137] The pen 1500 may also include a laser pointer 1524. The laser pointer 1524 may be coordinated with the IMU 1512 to coordinate gestures and laser pointing. For example, a user may use the laser 1524 in a presentation to help with guiding the audience with the interpretation of graphics and the IMU 1512 may, either simultaneously or when the laser 1524 is off, interpret the user's gestures as commands or data input.

[0138] FIGS. 16A-C illustrate several embodiments of lens and camera arrangements 1600 for the pen 1500. One aspect relates to maintaining a constant distance between the camera and the writing surface to enable the writing surface to be kept in focus for better tracking of movements of the pen 1500 over the writing surface. Another aspect relates to maintaining an angled surface following the circumference of the writing tip of the pen 1500 such that the pen 1500 can be rolled or partially rolled in the user's hand to create the feel and freedom of a conventional writing instrument.

[0139] FIG. 16A illustrates an embodiment of the writing lens end of the pen 1500. The configuration includes a ball lens 1604, a camera or image capture surface 1602, and a

domed cover lens 1608. In this arrangement, the camera views the writing surface through the ball lens 1604 and dome cover lens 1608. The ball lens 1604 causes the camera to focus such that the camera views the writing surface when the pen 1500 is held in the hand in a natural writing position, such as with the pen 1500 in contact with a writing surface. In embodiments, the ball lens 1604 should be separated from the writing surface to obtain the highest resolution of the writing surface at the camera 1602. In embodiments, the ball lens 1604 is separated by approximately 1 to 3 mm. In this configuration, the domed cover lens 1608 provides a surface that can keep the ball lens 1604 separated from the writing surface at a constant distance, such as substantially independent of the angle used to write on the writing surface. For instance, in embodiments the field of view of the camera in this arrangement would be approximately 60 degrees.

[0140] The domed cover lens, or other lens 1608 used to physically interact with the writing surface, will be transparent or transmissive within the active bandwidth of the camera 1602. In embodiments, the domed cover lens 1608 may be spherical or other shape and comprised of glass, plastic, sapphire, diamond, and the like. In other embodiments where low resolution imaging of the surface is acceptable. The pen 1500 can omit the domed cover lens 1608 and the ball lens 1604 can be in direct contact with the surface.

[0141] FIG. 16B illustrates another structure where the construction is somewhat similar to that described in connection with FIG. 16A; however this embodiment does not use a dome cover lens 1608, but instead uses a spacer 1610 to maintain a predictable distance between the ball lens 1604 and the writing surface, wherein the spacer may be spherical, cylindrical, tubular or other shape that provides spacing while allowing for an image to be obtained by the camera 1602 through the lens 1604. In a preferred embodiment, the spacer 1610 is transparent. In addition, while the spacer 1610 is shown as spherical, other shapes such as an oval, doughnut shape, half sphere, cone, cylinder or other form may be used.

[0142] FIG. 16C illustrates yet another embodiment, where the structure includes a post 1614, such as running through the center of the lensed end of the pen 1500. The post 1614 may be an ink deposition system (e.g. ink cartridge), graphite deposition system (e.g. graphite holder), or a dummy post whose purpose is mainly only that of alignment. The selection of the post type is dependent on the pen's use. For instance, in the event the user wants to use the pen 1500 as a conventional ink depositing pen as well as a fully functional external user interface 104, the ink system post would be the best selection. If there is no need for the 'writing' to be visible on the writing surface, the selection would be the dummy post. The embodiment of FIG. 16C includes camera(s) 1602 and an associated lens 1612, where the camera 1602 and lens 1612 are positioned to capture the writing surface without substantial interference from the post 1614. In embodiments, the pen 1500 may include multiple cameras 1602 and lenses 1612 such that more or all of the circumference of the tip 1614 can be used as an input system. In an embodiment, the pen 1500 includes a contoured grip that keeps the pen aligned in the user's hand so that the camera 1602 and lens 1612 remains pointed at the surface.

[0143] Another aspect of the pen 1500 relates to sensing the force applied by the user to the writing surface with the pen 1500. The force measurement may be used in a number of ways. For example, the force measurement may be used as a discrete value, or discontinuous event tracking, and compared

against a threshold in a process to determine a user's intent. The user may want the force interpreted as a 'click' in the selection of an object, for instance. The user may intend multiple force exertions interpreted as multiple clicks. There may be times when the user holds the pen 1500 in a certain position or holds a certain portion of the pen 1500 (e.g. a button or touch pad) while clicking to affect a certain operation (e.g. a 'right click'). In embodiments, the force measurement may be used to track force and force trends. The force trends may be tracked and compared to threshold limits, for example. There may be one such threshold limit, multiple limits, groups of related limits, and the like. For example, when the force measurement indicates a fairly constant force that generally falls within a range of related threshold values, the microprocessor 1510 may interpret the force trend as an indication that the user desires to maintain the current writing style, writing tip type, line weight, brush type, and the like. In the event that the force trend appears to have gone outside of a set of threshold values intentionally, the microprocessor may interpret the action as an indication that the user wants to change the current writing style, writing tip type, line weight, brush type, and the like. Once the microprocessor has made a determination of the user's intent, a change in the current writing style, writing tip type, line weight, brush type, and the like may be executed. In embodiments, the change may be noted to the user (e.g. in a display of the HWC 102), and the user may be presented with an opportunity to accept the change.

[0144] FIG. 17A illustrates an embodiment of a force sensing surface tip 1700 of a pen 1500. The force sensing surface tip 1700 comprises a surface connection tip 1702 (e.g. a lens as described herein elsewhere) in connection with a force or pressure monitoring system 1504. As a user uses the pen 1500 to write on a surface or simulate writing on a surface the force monitoring system 1504 measures the force or pressure the user applies to the writing surface and the force monitoring system communicates data to the microprocessor 1510 for processing. In this configuration, the microprocessor 1510 receives force data from the force monitoring system 1504 and processes the data to make predictions of the user's intent in applying the particular force that is currently being applied. In embodiments, the processing may be provided at a location other than on the pen (e.g. at a server in the HWC system 100, on the HWC 102). For clarity, when reference is made herein to processing information on the microprocessor 1510, the processing of information contemplates processing the information at a location other than on the pen. The microprocessor 1510 may be programmed with force threshold(s), force signature(s), force signature library and/or other characteristics intended to guide an inference program in determining the user's intentions based on the measured force or pressure. The microprocessor 1510 may be further programmed to make inferences from the force measurements as to whether the user has attempted to initiate a discrete action (e.g. a user interface selection 'click') or is performing a constant action (e.g. writing within a particular writing style). The inferring process is important as it causes the pen 1500 to act as an intuitive external user interface 104.

[0145] FIG. 17B illustrates a force 1708 versus time 1710 trend chart with a single threshold 1718. The threshold 1718 may be set at a level that indicates a discrete force exertion indicative of a user's desire to cause an action (e.g. select an object in a GUI). Event 1712, for example, may be interpreted as a click or selection command because the force quickly

increased from below the threshold 1718 to above the threshold 1718. The event 1714 may be interpreted as a double click because the force quickly increased above the threshold 1718, decreased below the threshold 1718 and then essentially repeated quickly. The user may also cause the force to go above the threshold 1718 and hold for a period indicating that the user is intending to select an object in the GUI (e.g. a GUI presented in the display of the HWC 102) and 'hold' for a further operation (e.g. moving the object).

[0146] While a threshold value may be used to assist in the interpretation of the user's intention, a signature force event trend may also be used. The threshold and signature may be used in combination or either method may be used alone. For example, a single-click signature may be represented by a certain force trend signature or set of signatures. The single-click signature(s) may require that the trend meet a criteria of a rise time between x any y values, a hold time of between a and b values and a fall time of between c and d values, for example. Signatures may be stored for a variety of functions such as click, double click, right click, hold, move, etc. The microprocessor 1510 may compare the real-time force or pressure tracking against the signatures from a signature library to make a decision and issue a command to the software application executing in the GUI.

[0147] FIG. 17C illustrates a force 1708 versus time 1710 trend chart with multiple thresholds 1718. By way of example, the force trend is plotted on the chart with several pen force or pressure events. As noted, there are both presumably intentional events 1720 and presumably non-intentional events 1722. The two thresholds 1718 of FIG. 4C create three zones of force: a lower, middle and higher range. The beginning of the trend indicates that the user is placing a lower zone amount of force. This may mean that the user is writing with a given line weight and does not intend to change the weight, the user is writing. Then the trend shows a significant increase 1720 in force into the middle force range. This force change appears, from the trend to have been sudden and thereafter it is sustained. The microprocessor 1510 may interpret this as an intentional change and as a result change the operation in accordance with preset rules (e.g. change line width, increase line weight, etc.). The trend then continues with a second apparently intentional event 1720 into the higher-force range. During the performance in the higher-force range, the force dips below the upper threshold 1718. This may indicate an unintentional force change and the microprocessor may detect the change in range however not affect a change in the operations being coordinated by the pen 1500. As indicated above, the trend analysis may be done with thresholds and/or signatures.

[0148] Generally, in the present disclosure, instrument stroke parameter changes may be referred to as a change in line type, line weight, tip type, brush type, brush width, brush pressure, color, and other forms of writing, coloring, painting, and the like.

[0149] Another aspect of the pen 1500 relates to selecting an operating mode for the pen 1500 dependent on contextual information and/or selection interface(s). The pen 1500 may have several operating modes. For instance, the pen 1500 may have a writing mode where the user interface(s) of the pen 1500 (e.g. the writing surface end, quick launch buttons 1522, touch sensor 1520, motion based gesture, and the like) is optimized or selected for tasks associated with writing. As another example, the pen 1500 may have a wand mode where the user interface(s) of the pen is optimized or selected for

tasks associated with software or device control (e.g. the HWC 102, external local device, remote device 112, and the like). The pen 1500, by way of another example, may have a presentation mode where the user interface(s) is optimized or selected to assist a user with giving a presentation (e.g. pointing with the laser pointer 1524 while using the button(s) 1522 and/or gestures to control the presentation or applications relating to the presentation). The pen may, for example, have a mode that is optimized or selected for a particular device that a user is attempting to control. The pen 1500 may have a number of other modes and an aspect of the present invention relates to selecting such modes.

[0150] FIG. 18A illustrates an automatic user interface(s) mode selection based on contextual information. The microprocessor 1510 may be programmed with IMU thresholds 1814 and 1812. The thresholds 1814 and 1812 may be used as indications of upper and lower bounds of an angle 1804 and 1802 of the pen 1500 for certain expected positions during certain predicted modes. When the microprocessor 1510 determines that the pen 1500 is being held or otherwise positioned within angles 1802 corresponding to writing thresholds 1814, for example, the microprocessor 1510 may then institute a writing mode for the pen's user interfaces. Similarly, if the microprocessor 1510 determines (e.g. through the IMU 1512) that the pen is being held at an angle 1804 that falls between the predetermined wand thresholds 1812, the microprocessor may institute a wand mode for the pen's user interface. Both of these examples may be referred to as context based user interface mode selection as the mode selection is based on contextual information (e.g. position) collected automatically and then used through an automatic evaluation process to automatically select the pen's user interface(s) mode.

[0151] As with other examples presented herein, the microprocessor 1510 may monitor the contextual trend (e.g. the angle of the pen over time) in an effort to decide whether to stay in a mode or change modes. For example, through signatures, thresholds, trend analysis, and the like, the microprocessor may determine that a change is an unintentional change and therefore no user interface mode change is desired.

[0152] FIG. 18B illustrates an automatic user interface(s) mode selection based on contextual information. In this example, the pen 1500 is monitoring (e.g. through its microprocessor) whether or not the camera at the writing surface end 1508 is imaging a writing surface in close proximity to the writing surface end of the pen 1500. If the pen 1500 determines that a writing surface is within a predetermined relatively short distance, the pen 1500 may decide that a writing surface is present 1820 and the pen may go into a writing mode user interface(s) mode. In the event that the pen 1500 does not detect a relatively close writing surface 1822, the pen may predict that the pen is not currently being used to as a writing instrument and the pen may go into a non-writing user interface(s) mode.

[0153] FIG. 18C illustrates a manual user interface(s) mode selection. The user interface(s) mode may be selected based on a twist of a section 1824 of the pen 1500 housing, clicking an end button 1828, pressing a quick launch button 1522, interacting with touch sensor 1520, detecting a predetermined action at the pressure monitoring system (e.g. a click), detecting a gesture (e.g. detected by the IMU), etc. The

manual mode selection may involve selecting an item in a GUI associated with the pen 1500 (e.g. an image presented in the display of HWC 102).

[0154] In embodiments, a confirmation selection may be presented to the user in the event a mode is going to change. The presentation may be physical (e.g. a vibration in the pen 1500), through a GUI, through a light indicator, etc.

[0155] FIG. 19 illustrates a couple pen use-scenarios 1900 and 1901. There are many use scenarios and we have presented a couple in connection with FIG. 19 as a way of illustrating use scenarios to further the understanding of the reader. As such, the use-scenarios should be considered illustrative and non-limiting.

[0156] Use scenario 1900 is a writing scenario where the pen 1500 is used as a writing instrument. In this example, quick launch button 122A is pressed to launch a note application 1910 in the GUI 1908 of the HWC 102 display 1904. Once the quick launch button 122A is pressed, the HWC 102 launches the note program 1910 and puts the pen into a writing mode. The user uses the pen 1500 to scribe symbols 1902 on a writing surface, the pen records the scribing and transmits the scribing to the HWC 102 where symbols representing the scribing are displayed 1912 within the note application 1910.

[0157] Use scenario 1901 is a gesture scenario where the pen 1500 is used as a gesture capture and command device. In this example, the quick launch button 122B is activated and the pen 1500 activates a wand mode such that an application launched on the HWC 102 can be controlled. Here, the user sees an application chooser 1918 in the display(s) of the HWC 102 where different software applications can be chosen by the user. The user gestures (e.g. swipes, spins, turns, etc.) with the pen to cause the application chooser 1918 to move from application to application. Once the correct application is identified (e.g. highlighted) in the chooser 1918, the user may gesture or click or otherwise interact with the pen 1500 such that the identified application is selected and launched. Once an application is launched, the wand mode may be used to scroll, rotate, change applications, select items, initiate processes, and the like, for example.

[0158] In an embodiment, the quick launch button 122A may be activated and the HWC 102 may launch an application chooser presenting to the user a set of applications. For example, the quick launch button may launch a chooser to show all communication programs (e.g. SMS, Twitter, Instagram, Facebook, email, etc.) available for selection such that the user can select the program the user wants and then go into a writing mode. By way of further example, the launcher may bring up selections for various other groups that are related or categorized as generally being selected at a given time (e.g. Microsoft Office products, communication products, productivity products, note products, organizational products, and the like)

[0159] FIG. 20 illustrates yet another embodiment of the present invention. FIG. 2000 illustrates a watchband clip on controller 2000. The watchband clip on controller may be a controller used to control the HWC 102 or devices in the HWC system 100. The watchband clip on controller 2000 has a fastener 2018 (e.g. rotatable clip) that is mechanically adapted to attach to a watchband, as illustrated at 2004.

[0160] The watchband controller 2000 may have quick launch interfaces 2008 (e.g. to launch applications and choosers as described herein), a touch pad 2014 (e.g. to be used as a touch style mouse for GUI control in a HWC 102 display)

and a display **2012**. The clip **2018** may be adapted to fit a wide range of watchbands so it can be used in connection with a watch that is independently selected for its function. The clip, in embodiments, is rotatable such that a user can position it in a desirable manner. In embodiments the clip may be a flexible strap. In embodiments, the flexible strap may be adapted to be stretched to attach to a hand, wrist, finger, device, weapon, and the like.

**[0161]** In embodiments, the watchband controller may be configured as a removable and replaceable watchband. For example, the controller may be incorporated into a band with a certain width, segment spacing's, etc. such that the watchband, with its incorporated controller, can be attached to a watch body. The attachment, in embodiments, may be mechanically adapted to attach with a pin upon which the watchband rotates. In embodiments, the watchband controller may be electrically connected to the watch and/or watch body such that the watch, watch body and/or the watchband controller can communicate data between them.

**[0162]** The watchband controller may have 3-axis motion monitoring (e.g. through an IMU, accelerometers, magnetometers, gyroscopes, etc.) to capture user motion. The user motion may then be interpreted for gesture control.

**[0163]** In embodiments, the watchband controller may comprise fitness sensors and a fitness computer. The sensors may track heart rate, calories burned, strides, distance covered, and the like. The data may then be compared against performance goals and/or standards for user feedback.

**[0164]** Another aspect of the present invention relates to visual display techniques relating to micro Doppler ("mD") target tracking signatures ("mD signatures"). mD is a radar technique that uses a series of angle dependent electromagnetic pulses that are broadcast into an environment and return pulses are captured. Changes between the broadcast pulse and return pulse are indicative of changes in the shape, distance and angular location of objects or targets in the environment. These changes provide signals that can be used to track a target and identify the target through the mD signature. Each target or target type has a unique mD signature. Shifts in the radar pattern can be analyzed in the time domain and frequency domain based on mD techniques to derive information about the types of targets present (e.g. whether people are present), the motion of the targets and the relative angular location of the targets and the distance to the targets. By selecting a frequency used for the mD pulse relative to known objects in the environment, the pulse can penetrate the known objects to enable information about targets to be gathered even when the targets are visually blocked by the known objects. For example, pulse frequencies can be used that will penetrate concrete buildings to enable people to be identified inside the building. Multiple pulse frequencies can be used as well in the mD radar to enable different types of information to be gathered about the objects in the environment. In addition, the mD radar information can be combined with other information such as distance measurements or images captured of the environment that are analyzed jointly to provide improved object identification and improved target identification and tracking. In embodiments, the analysis can be performed on the HWC or the information can be transmitted to a remote network for analysis and results transmitted back to the HWC. Distance measurements can be provided by laser range finding, structured lighting, stereoscopic depth maps or sonar measurements. Images of the environment can be captured using one or more cameras capable of capturing images

from visible, ultraviolet or infrared light. The mD radar can be attached to the HWC, located adjacently (e.g. in a vehicle) and associated wirelessly with the HWC or located remotely. Maps or other previously determined information about the environment can also be used in the analysis of the mD radar information. Embodiments of the present invention relate to visualizing the mD signatures in useful ways.

**[0165]** FIG. 21 illustrates a FOV **2102** of a HWC **102** from a wearer's perspective. The wearer, as described herein elsewhere, has a see-through FOV **2102** wherein the wearer views adjacent surroundings, such as the buildings illustrated in FIG. 21. The wearer, as described herein elsewhere, can also see displayed digital content presented within a portion of the FOV **2102**. The embodiment illustrated in FIG. 21 is indicating that the wearer can see the buildings and other surrounding elements in the environment and digital content representing traces, or travel paths, of bullets being fired by different people in the area. The surroundings are viewed through the transparency of the FOV **2102**. The traces are presented via the digital computer display, as described herein elsewhere. In embodiments, the trace presented is based on a mD signature that is collected and communicated to the HWC in real time. The mD radar itself may be on or near the wearer of the HWC **102** or it may be located remote from the wearer. In embodiments, the mD radar scans the area, tracks and identifies targets, such as bullets, and communicates traces, based on locations, to the HWC **102**.

**[0166]** There are several traces **2108** and **2104** presented to the wearer in the embodiment illustrated in FIG. 21. The traces communicated from the mD radar may be associated with GPS locations and the GPS locations may be associated with objects in the environment, such as people, buildings, vehicles, etc, both in latitude and longitude perspective and an elevation perspective. The locations may be used as markers for the HWC such that the traces, as presented in the FOV, can be associated, or fixed in space relative to the markers. For example, if the friendly fire trace **2108** is determined, by the mD radar, to have originated from the upper right window of the building on the left, as illustrated in FIG. 21, then a virtual marker may be set on or near the window. When the HWC views, through its camera or other sensor, for example, the building's window, the trace may then virtually anchor with the virtual marker on the window. Similarly, a marker may be set near the termination position or other flight position of the friendly fire trace **2108**, such as the upper left window of the center building on the right, as illustrated in FIG. 21. This technique fixes in space the trace such that the trace appears fixed to the environmental positions independent of where the wearer is looking. So, for example, as the wearer's head turns, the trace appears fixed to the marked locations.

**[0167]** In embodiments, certain user positions may be known and thus identified in the FOV. For example, the shooter of the friendly fire trace **2108** may be from a known friendly combatant and as such his location may be known. The position may be known based on his GPS location based on a mobile communication system on him, such as another HWC **102**. In other embodiments, the friendly combatant may be marked by another friendly. For example, if the friendly position in the environment is known through visual contact or communicated information, a wearer of the HWC **102** may use a gesture or external user interface **104** to mark the location. If a friendly combatant location is known the originating position of the friendly fire trace **2108** may be color coded or otherwise distinguished from unidentified

traces on the displayed digital content. Similarly, enemy fire traces **2104** may be color coded or otherwise distinguished on the displayed digital content. In embodiments, there may be an additional distinguished appearance on the displayed digital content for unknown traces.

**[0168]** In addition to situationally associated trace appearance, the trace colors or appearance may be different from the originating position to the terminating position. This path appearance change may be based on the mD signature. The mD signature may indicate that the bullet, for example, is slowing as it propagates and this slowing pattern may be reflected in the FOV **2102** as a color or pattern change. This can create an intuitive understanding of where the shooter is located. For example, the originating color may be red, indicative of high speed, and it may change over the course of the trace to yellow, indicative of a slowing trace. This pattern changing may also be different for a friendly, enemy and unknown combatant. The enemy may go blue to green for a friendly trace, for example.

**[0169]** FIG. **21** illustrates an embodiment where the user sees the environment through the FOV and may also see color coded traces, which are dependent on bullet speed and combatant type, where the traces are fixed in environmental positions independent on the wearer's perspective.

**[0170]** Another aspect of the present invention relates to mD radar techniques that trace and identify targets through other objects, such as walls (referred to generally as through wall mD), and visualization techniques related therewith. FIG. **22** illustrates a through wall mD visualization technique according to the principles of the present invention. As described herein elsewhere, the mD radar scanning the environment may be local or remote from the wearer of a HWC **102**. The mD radar may identify a target (e.g. a person) that is visible **2204** and then track the target as he goes behind a wall **2208**. The tracking may then be presented to the wearer of a HWC **102** such that digital content reflective of the target and the target's movement, even behind the wall, is presented in the FOV **2202** of the HWC **102**. In embodiments, the target, when out of visible sight, may be represented by an avatar in the FOV to provide the wearer with imagery representing the target.

**[0171]** mD target recognition methods can identify the identity of a target based on the vibrations and other small movements of the target. This can provide a personal signature for the target. In the case of humans, this may result in a personal identification of a target that has been previously characterized. The cardio, heart beat, lung expansion and other small movements within the body may be unique to a person and if those attributes are pre-identified they may be matched in real time to provide a personal identification of a person in the FOV **2202**. The person's mD signatures may be determined based on the position of the person. For example, the database of personal mD signature attributes may include mD signatures for a person standing, sitting, laying down, running, walking, jumping, etc. This may improve the accuracy of the personal data match when a target is tracked through mD signature techniques in the field. In the event a person is personally identified, a specific indication of the person's identity may be presented in the FOV **2202**. The indication may be a color, shape, shade, name, indication of the type of person (e.g. enemy, friendly, etc.), etc. to provide the wearer with intuitive real time information about the person being tracked. This may be very useful in a situation where there is more than one person in an area of the person

being tracked. If just one person in the area is personally identified, that person or the avatar of that person can be presented differently than other people in the area.

**[0172]** In embodiments, the mD radar may be mounted on a person (e.g. soldier, security person, or other person). In embodiments, the mD radar may be configured to be small enough such that it can be mounted on a helmet of a combatant (e.g. an NVG Mount of a Soldier's Helmet). In embodiments the configuration may be approximately 5 inches by 3 inches and an inch thick such that it mounts conveniently on the NVG mount. In embodiments, the mD signature captured by the NVG mounted, or otherwise personnel mounted, mD radar may be directly produced into an image and displayed in the FOV of the HWC **102**. The field of view for the mD radar may be similar to that of the FOV of the HWC **102** allowing for a more straightforward translation of the mD signatures into display content for the HWC **102**. For example, the mD signature may be presented as digital content as an image or video in the FOV of the HWC **102**.

**[0173]** In embodiments, heartbeat, cardio, lung movements and the like of all known friendly combatants may be tracked in an effort to identify anyone in stress or injury situations. In embodiments, the friendly combatant tracking may be accomplished through mD signatures. In other embodiments, the friendly combatant tracking may be accomplished through personally worn sensors (e.g. the watch clip controller as described herein elsewhere), and the data may be communicated from the personally worn sensors.

**[0174]** FIG. **23** illustrates an mD scanned environment **2300**. An mD radar may scan an environment in an attempt to identify objects in the environment. In this embodiment, the mD scanned environment reveals two vehicles **2302a** and **2302b**, an enemy combatant **2309**, two friendly combatants **2308a** and **2308b** and a shot trace **2318**. Each of these objects may be personally identified or type identified. For example, the vehicles **2302a** and **2302b** may be identified through the mD signatures as a tank and heavy truck. The enemy combatant **2309** may be identified as a type (e.g. enemy combatant) or more personally (e.g. by name). The friendly combatants may be identified as a type (e.g. friendly combatant) or more personally (e.g. by name). The shot trace **2318** may be characterized by type of projectile or weapon type for the projectile, for example.

**[0175]** FIG. **23a** illustrates two separate HWC **102** FOV display techniques according to the principles of the present invention. FOV **2312** illustrates a map view **2310** where the mD scanned environment is presented. Here, the wearer has a perspective on the mapped area so he can understand all tracked targets in the area. This allows the wearer to traverse the area with knowledge of the targets. FOV **2312** illustrates a heads-up view to provide the wearer with an augmented reality style view of the environment that is in proximity of the wearer.

**[0176]** Another aspect of the present invention relates to securely linking HWC's **102** such that files, streams, feeds, data, information, etc. can be securely shared. HWC's **102** may be on local area networks, wide area networks, cell networks, WiFi networks, close proximity networks, etc. or may otherwise be connected with devices to enable sharing. In embodiments, intuitive methods are deployed to enable the wearer of a HWC to identify a person or device for sharing. Once identified, information may be transferred between devices and/or confirmation of proper identification may be made before any information is transferred.

[0177] FIG. 24 illustrates a generalized form of network topology 2400, which may be deployed in connection with linking and sharing methods as is discussed in more detail herein. In FIG. 24, each device in the network 2400 (e.g. each HWC 102) is represented as a node 2402 and 2404. In this embodiment, each node 2402 and 2404 may communicate directly with any other node 2402 and 2404. Each node may also communicate indirectly; through another node. In embodiments, there is a master node 2404 that routes all communications and may have higher bandwidth than the slave nodes 2402. The network 2400 may be a self healing ad hoc network, WiFi network, cell network, local network, wide area network, close proximity network, etc. Any node 2402 and 2404 may link and/or share information with any other node 2402 and 2404 of the network 2400.

[0178] FIG. 25 illustrates an embodiment of a sharing interface presented in the FOV 2508 of a HWC 102. The sharing interface may have a representation of a file or stream 2502 that is capable of being shared along with several options for sharing method 2504 (e.g. share via sms message, text message, email, social network, posting, direct file transfer, etc.). The sharing interface may also interoperate with a user interface to allow the wearer of the HWC to select the file or stream 2502 and sharing option 2504. In this embodiment, a cursor 2510 is illustrated to indicate that an external user interface, gesture, eye tracking control, etc. may be used to assist the wearer with selecting items within the FOV 2508.

[0179] FIG. 26 illustrates a method of identifying a person with whom a wearer of a HWC 102 may want to link or share information. In this embodiment, there are three people 2602a, 2602b, and 2602c within an identified sharing zone 2602 (e.g. an area identified by a GPS or other triangulation established zone(s)). The sharing zone may be indicative of a predetermined area that provides confidence that anyone in the zone is in close enough proximity to one another that they can identify one another for linking and/or sharing. Once identified as being in the sharing zone 2602, identification of the people's viewing angles 2604 may be established. This is to find two viewing angles that are substantially aligned and opposite to determine if two people are looking at one another. For example, person 2602a and person 2602c have substantially aligned and opposite viewing angles so the system may assume that, since they are in the sharing zone and apparently looking at one another, if one of the two has initiated a share command (e.g. via sharing option 2504) that the two intend to share information and/or become linked.

[0180] In embodiments, the viewing angle of a person 2604 may be determined by an electronic compass in the HWC, through examination of camera images, or otherwise. The substantial alignment and opposite nature of the viewing angles 2604 may be determined by comparing each person's individual viewing angles 2604 as determined by internal electronic compasses in the HWCs. In an embodiment, it may be determined by determining each person's viewing angle 2604 through a determination of environmental images captured by the two people when the environment is a known environment such that a comparison of the images and the known features in the environment can be made. In another embodiment, the HWC's may take images to form an understanding if the desired sharing pair are looking at one another by estimating the person's direction in the image.

[0181] Once substantial alignment and opposite directionality of the two people is established, user information of the two people 2608 may be obtained such that device identifi-

cation 2610 (e.g. IP address, hardware serial number, security code, etc.) may be obtained. In embodiments, user information may not be required and device identification may be obtained.

[0182] In embodiments, after the device ID 2610 is retrieved for the receiving device, of the pair of devices, an indication confirming the interaction may be presented in the FOV 2614 of the sender's HWC 102. The sender may then interact with the indication (e.g. through an external UI, gesture, eye movement, wink, etc.). For example, the user may use an external user interface, as described herein elsewhere, to interact with the content in the FOV 2614 with a cursor. In embodiments, the sender may gesture (e.g. a thumbs up sign) and the gesture may be captured and interpreted by the sender's HWC 102 as an indication confirming the interaction with the receiver.

[0183] FIG. 27 illustrates another embodiment where linking and sharing partners are established. In this embodiment, a sender 2704 may capture facial images, or other biometric information, of potential recipients 2702 in the area by scanning the area. The facial images may be processed remotely or locally to obtain facial recognition information from a database 2708 when it is available. Once the people are recognized, assuming at least one is in the facial recognition database 2708, user information 2710 and device ID 2712 may be obtained. Each of the recognized people may be represented in the FOV 2718 of the sender's HWC 102. In embodiments, the recognized people may be presented in a facial recognition pallet 2714, through augmented reality where identifications are augmented in a way that identifies the people as the sender views them through the FOV 2718 or otherwise presented. Once presented with user and/or device information, the sender can select one or more of the people to link to and/or share with through techniques described herein.

[0184] FIG. 28 illustrates another embodiment where linking and sharing partners are established. In this embodiment, the range of acceptable recipients may be in very close proximity and a near field communication (NFC) zone 2802 may be established and anyone within the NFC zone 2802 may be identified, or an attempt may be made to identify anyone in the zone. Once identified, user information and/or device information may be retrieved such that they can be presented to the sender in his FOV 2812. In embodiments, the identified people may be represented in a NFC pallet 2814, through augmented reality where identifications are augmented in a way that identifies the people as the sender views them through the FOV 2812, or otherwise presented. Once presented with user and/or device information, the sender can select one or more of the people to link to and/or share with through techniques described herein.

[0185] FIG. 29 illustrates a linking/sharing embodiment that includes the sender communicating a request for identifications within the proximity of the sender (a "proximity request") 2902. The proximity request 2902 may be sent through a communication protocol that has a restricted distance (e.g. NFC request) such that the only recipients of the request are in close proximity to the sender. In other embodiments, the proximity request 2902 may require confirmation of the location of the potential recipients (e.g. a GPS location) to confirm that the potential recipients are in the proximity of the sender. Once the potential recipients' devices respond to the proximity request 2902, user information 2904 and/or device information 2908 may be obtained and presented in the FOV 2912 of the sender. In embodiments, the presentation

and sender interactions with the content in the FOV may be as described herein. FIG. 29 illustrates a position or AR map of the region with the identified people and/or devices.

[0186] FIG. 30 illustrates another embodiment of share/linking. In this embodiment, a recipient and/or sender may gesture 3002 to indicate the desire to share/link. The other's HWC sensor(s) (e.g. camera) may capture the gesture and then it may be interpreted as an appropriate share/link gesture. People or groups may have preset gestures that indicate acceptable sharing. The sharing gestures may be securely maintained and periodically changed to maintain security. The gestures may be complicated motions including several different motions. Similar to the other embodiments described herein elsewhere, once identified, user and/or device information may be obtained and indications of same may be presented in the FOV 3014 for interaction. Once the link is established, as with the other embodiments described herein, the user may transfer files/streaming information or make other transfers by activating items in the HWC FOV user interface (e.g. by using a gesture, external user interface, etc.), gesturing (e.g. making a throwing motion to indicate the transfer, etc.

[0187] FIG. 31 illustrates another embodiment of share/linking. In this embodiment, a recipient and/or sender may make a voice command 3102 to indicate the desire to share/link. The other's HWC sensor(s) (e.g. microphone) may capture the voice command 3102 and then it may be interpreted as an appropriate share/link gesture. People or groups may have preset voice commands that indicate acceptable sharing. The sharing voice commands may be securely maintained and periodically changed to maintain security. In embodiments, voice recognition may be used to identify the person making the voice command. This may be of particular need in a secure environment. Similar to other embodiments described herein elsewhere, once identified, user and/or device information may be obtained and indications of same may be presented in the FOV 3114 for interaction.

[0188] FIG. 32 illustrates another embodiment of share/linking. In this embodiment, a recipient and/or sender may send a light signal 3202 to indicate the desire to share/link. The other's HWC sensor(s) (e.g. camera) may capture the light signal 3202 and then it may be interpreted as an appropriate share/link gesture. People or groups may have preset light signals 3202 that indicate acceptable sharing. The light transmission may be coded to be read automatically by the other party. The sharing light signals 3202 may be securely maintained and periodically changed to maintain security. Similar to the other embodiments described herein elsewhere, once identified, user and/or device information may be obtained and indications of same may be presented in the FOV 3214 for interaction.

[0189] FIG. 33 illustrates another embodiment of share/linking. In this embodiment, a recipient and/or sender may read RFID or other short-range identification markers 3302 to indicate an acceptable person for sharing/linking. Similar to the other embodiments described herein elsewhere, once identified, user and/or device information may be obtained and indications of same may be presented in the FOV 3014 for interaction.

[0190] The linking and sharing embodiments described herein may be used to establish secure and known nodes in a communication network. For example, users may want to share photos, videos, files, data, information, streams, communications, etc., and the users may want to be sure that they

know who they are sharing with so they may use a technique or combination of techniques described herein. In combat situations, users may want to share similar types of information but want to also keep the sharing from any enemy combatants so the security provided by the identification and confirmation techniques described herein may have added security value. Feeds from drones, mDoppler information as described herein, other combatants' camera views, etc. may be shared via techniques and combination of techniques described herein.

[0191] Another aspect of the present invention relates to shadowing digitally presented content in an FOV of a HWC such that the content appears to have substantially similar lighting as objects in the surrounding environment that the wearer can view through the FOV.

[0192] FIG. 34 illustrates a digital object 3402 presented in connection with a digital shadow 3404 in a FOV 3408 of an HWC 102. The digital shadow 3404 is positioned such that the wearer of the HWC 102 perceives that it is associated with the digital object 3402 and that the lighting conditions in the surrounding environment are causing the shadow from the object. In embodiments, the GPS location, compass heading, time of year and time of day relating to the HWC's position may be known and the shadow may be positioned and sized based thereon such that the object appears to be lit by the sun. In other embodiments, the lighting conditions in the environment may be evaluated (e.g. through imaging of the environment) such that the lighting conditions in the environment can be mimicked. For example, a camera in the HWC 102 may image the environment and a processor, either onboard or remote from the HWC 102, may interpret the general position of the dominate lighting to then determine position of the digital shadow 3404. In situations, there may be more than one light source (e.g. in an auditorium, stadium, inside a building, on a lighted street, etc.) and the several light sources may cause several shadows to be cast by objects in the environment. To make a more realistic image, in embodiments, the digital shadow may be several shadows indicative of the several light sources. In embodiments this may include determining shadow effects at a certain position in the environment because the digital object 3402 is positioned in the FOV 3408 to be perceived by the wearer at the certain position in the environment. This may be accomplished by deciphering images taken in connection with certain positions in the environment. In embodiments, the artificial lighting systems may be of known or predictable positions and the digital shadow may be positioned based on the known or predictable positions.

[0193] Another aspect of the present invention relates to visual presentations, within a field of view of a HWC 102, indicative of a person or object at a known location. Embodiments involve presenting an indication of another person's ("other person") known location to a person wearing a see-through display of a head-worn computer ("first person"). The process may be embodied in computer media in one or more parts. The method employed may involve receiving geo-spatial coordinates corresponding to the other person's known location; receiving geo-spatial coordinates corresponding to a location of the first person; receiving a compass heading for the first person that is indicative of a direction in which the first person is looking; generating a virtual target line between a see-through visual plane of the head-worn computer and the other person such that the target line describes a distance and angle between the known location

and the location and the looking direction of the first person; and presenting, in the field of view of the head-worn computer **102**, digital content to augment the first person's view of an environment seen through the see-through display of the head-worn computer, wherein the digital content is positioned within the field of view along the virtual target line such that the first person perceives the digital content in a position within the environment that represents the known location.

[0194] FIG. 35 illustrates an environmentally position locked digital content **3512** that is indicative of a person's location **3502**. In this disclosure the term "BlueForce" is generally used to indicate team members or members for which geo-spatial locations are known and can be used. In embodiments, "BlueForce" is a term to indicate members of a tactical arms team (e.g. a police force, secret service force, security force, military force, national security force, intelligence force, etc.). In many embodiments herein one member may be referred to as the primary or first BlueForce member and it is this member, in many described embodiments, that is wearing the HWC. It should be understood that this terminology is to help the reader and make for clear presentations of the various situations and that other members of the Blueforce, or other people, may have HWC's **102** and have similar capabilities. In this embodiment, a first person is wearing a head-worn computer **102** that has a see through field of view ("FOV") **3514**. The first person can see through the FOV to view the surrounding environment through the FOV and digital content can also be presented in the FOV such that the first person can view the actual surroundings, through the FOV, in a digitally augmented view. The other BlueForce person's location is known and is indicated at a position inside of a building at point **3502**. This location is known in three dimensions, longitude, latitude and altitude, which may have been determined by GPS along with an altimeter associated with the other Blueforce person. Similarly, the location of the first person wearing the HWC **102** is also known, as indicated in FIG. 35 as point **3508**. In this embodiment, the compass heading **3510** of the first person is also known. With the compass heading **3510** known, the angle in which the first person is viewing the surroundings can be estimated. A virtual target line between the location of the first person **3508** and the other person's location **3502** can be established in three dimensional space and emanating from the HWC **102** proximate the FOV **3514**. The three dimensionally oriented virtual target line can then be used to present environmentally position locked digital content in the FOV **3514**, which is indicative of the other person's location **3502**. The environmentally position locked digital content **3502** can be positioned within the FOV **3514** such that the first person, who is wearing the HWC **102**, perceives the content **3502** as locked in position within the environment and marking the location of the other person **3502**.

[0195] The three dimensionally positioned virtual target line can be recalculated periodically (e.g. every millisecond, second, minute, etc.) to reposition the environmentally position locked content **3512** to remain in-line with the virtual target line. This can create the illusion that the content **3512** is staying positioned within the environment at a point that is associated with the other person's location **3502** independent of the location of the first person **3508** wearing the HWC **102** and independent of the compass heading of the HWC **102**.

[0196] In embodiments, the environmentally locked digital content **3512** may be positioned with an object **3504** that is

between the first person's location **3508** and the other person's location **3502**. The virtual target line may intersect the object **3504** before intersecting with the other person's location **3502**. In embodiments, the environmentally locked digital content **3512** may be associated with the object intersection point **3504**. In embodiments, the intersecting object **3504** may be identified by comparing the two person's locations **3502** and **3508** with obstructions identified on a map. In embodiments the intersecting object **3504** may be identified by processing images captured from a camera, or other sensor, associated with the HWC **102**. In embodiments, the digital content **3512** has an appearance that is indicative of being at the location of the other person **3502** and/or at the location of the intersecting object **3504** to provide a more clear indication of the position of the other person's position **3502** in the FOV **3514**.

[0197] FIG. 36 illustrates how and where digital content may be positioned within the FOV **3608** based on a virtual target line between the location of the first person **3508**, who's wearing the HWC **102**, and the other person **3502**. In addition to positioning the content in a position within the FOV **3608** that is in-line with the virtual target line, the digital content may be presented such that it comes into focus by the first person when the first person focuses at a certain plane or distance in the environment. Presented object A **3618** is digitally generated content that is presented as an image at content position A **3612**. The position **3612** is based on the virtual target line. The presented object A **3618** is presented not only along the virtual target line but also at a focal plane B **3614** such that the content at position A **3612** in the FOV **3608** comes into focus by the first person when the first person's eye **3602** focuses at something in the surrounding environment at the focal plane B **3614** distance. Setting the focal plane of the presented content provides content that does not come into focus until the eye **3602** focuses at the set focal plane. In embodiments, this allows the content at position A to be presented when the HWC's compass is indicative of the first person looking in the direction of the other person **3502** but it will only come into focus when the first person focuses on in the direction of the other person **3502** and at the focal plane of the other person **3502**.

[0198] Presented object B **3620** is aligned with a different virtual target line then presented object A **3618**. Presented object B **3620** is also presented at content position B **3604** at a different focal plane than the content position A **3612**. Presented content B **3620** is presented at a further focal plane, which is indicative that the other person **3502** is physically located at a further distance. If the focal planes are sufficiently different, the content at position A will come into focus at a different time than the content at position B because the two focal planes require different focus from the eye **3602**.

[0199] FIG. 37 illustrates several BlueForce members at locations with various points of view from the first person's perspective. In embodiments, the relative positions, distances and obstacles may cause the digital content indicative of the other person's location to be altered. For example, if the other person can be seen by the first person through the first person's FOV, the digital content may be locked at the location of the other person and the digital content may be of a type that indicates the other person's position is being actively marked and tracked. If the other person is in relatively close proximity, but cannot be seen by the first person, the digital content may be locked to an intersecting object or area and the digital content may indicate that the actual location of the other

person cannot be seen but the mark is generally tracking the other person's general position. If the other person is not within a pre-determined proximity or is otherwise more significantly obscured from the first person's view, the digital content may generally indicate a direction or area where the other person is located and the digital content may indicate that the other person's location is not closely identified or tracked by the digital content, but that the other person is in the general area.

[0200] Continuing to refer to FIG. 37, several BlueForce members are presented at various positions within an area where the first person is located. The primary BlueForce member 3702 (also referred to generally as the first person, or the person wherein the HWC with the FOV for example purposes) can directly see the BlueForce member in the open field 3704. In embodiments, the digital content provided in the FOV of the primary BlueForce member may be based on a virtual target line and virtually locked in an environment position that is indicative of the open field position of the BlueForce member 3704. The digital content may also indicate that the location of the open field BlueForce member is marked and is being tracked. The digital content may change forms if the BlueForce member becomes obscured from the vision of the primary BlueForce member or otherwise becomes unavailable for direct viewing.

[0201] BlueForce member 3708 is obscured from the primary BlueForce member's 3702 view by an obstacle that is in close proximity to the obscured member 3708. As depicted, the obscured member 3708 is in a building but close to one of the front walls. In this situation, the digital content provided in the FOV of the primary member 3702 may be indicative of the general position of the obscured member 3708 and the digital content may indicate that, while the other person's location is fairly well marked, it is obscured so it is not as precise as if the person was in direct view. In addition, the digital content may be virtually positionally locked to some feature on the outside of the building that the obscured member is in. This may make the environmental locking more stable and also provide an indication that the location of the person is somewhat unknown.

[0202] BlueForce member 3710 is obscured by multiple obstacles. The member 3710 is in a building and there is another building 3712 in between the primary member 3702 and the obscured member 3710. In this situation, the digital content in the FOV of the primary member will be spatially quite short of the actual obscured member and as such the digital content may need to be presented in a way that indicates that the obscured member 3710 is in a general direction but that the digital marker is not a reliable source of information for the particular location of obscured member 3710.

[0203] FIG. 38 illustrates yet another method for positioning digital content within the FOV of a HWC where the digital content is intended to indicate a position of another person. This embodiment is similar to the embodiment described in connection with FIG. 38 herein. The main additional element in this embodiment is the additional step of verifying the distance between the first person 3508, the one wearing the HWC with the FOV digital content presentation of location, and the other person at location 3502. Here, a range finder may be included in the HWC and measure a distance at an angle that is represented by the virtual target line. In the event that the range finder finds an object obstructing the path of the virtual target line, the digital content presentation in the FOV may indicate such (e.g. as described herein elsewhere). In the

event that the range finder confirms that there is a person or object at the end of the prescribed distance and angle defined by the virtual target line, the digital content may represent that the proper location has been marked, as described herein elsewhere.

[0204] Another aspect of the present invention relates to predicting the movement of BlueForce members to maintain proper virtual marking of the BlueForce member locations. FIG. 39 illustrates a situation where the primary BlueForce member 3902 is tracking the locations of the other BlueForce members through an augmented environment using a HWC 102, as described herein elsewhere (e.g. as described in connection with the above figures). The primary BlueForce member 3902 may have knowledge of the tactical movement plan 3908. The tactical movement plan maybe maintained locally (e.g. on the HWCs 102 with sharing of the plan between the BlueForce members) or remotely (e.g. on a server and communicated to the HWC's 102, or communicated to a subset of HWC's 102 for HWC 102 sharing). In this case, the tactical plan involves the BlueForce group generally moving in the direction of the arrow 3908. The tactical plan may influence the presentations of digital content in the FOV of the HWC 102 of the primary BlueForce member. For example, the tactical plan may assist in the prediction of the location of the other BlueForce member and the virtual target line may be adjusted accordingly. In embodiments, the area in the tactical movement plan may be shaded or colored or otherwise marked with digital content in the FOV such that the primary BlueForce member can manage his activities with respect to the tactical plan. For example, he may be made aware that one or more BlueForce members are moving towards the tactical path 3908. He may also be made aware of movements in the tactical path that do not appear associated with BlueForce members.

[0205] FIG. 39 also illustrates that internal IMU sensors in the HWCs worn by the BlueForce members may provide guidance on the movement of the members 3904. This may be helpful in identifying when a GPS location should be updated and hence updating the position of the virtual marker in the FOV. This may also be helpful in assessing the validity of the GPS location. For example, if the GPS location has not updated but there is significant IMU sensor activity, the system may call into question the accuracy of the identified location. The IMU information may also be useful to help track the position of a member in the event the GPS information is unavailable. For example, dead reckoning may be used if the GPS signal is lost and the virtual marker in the FOV may indicate both indicated movements of the team member and indicate that the location identification is not ideal. The current tactical plan 3908 may be updated periodically and the updated plans may further refine what is presented in the FOV of the HWC 102.

[0206] FIG. 40 illustrates a BlueForce tracking system in accordance with the principles of the present invention. In embodiments, the BlueForce HWC's 102 may have directional antenna's that emit relatively low power directional RF signals such that other BlueForce members within the range of the relatively low power signal can receive and assess it's direction and/or distance based on the strength and varying strength of the signals. In embodiments, the tracking of such RF signals can be used to alter the presentation of the virtual markers of persons locations within the FOV of HWC 102.

[0207] Another aspect of the present invention relates to monitoring the health of BlueForce members. Each Blue-

Force member may be automatically monitored for health and stress events. For example, the members may have a watchband as described herein elsewhere or other wearable biometric monitoring device and the device may continually monitor the biometric information and predict health concerns or stress events. As another example, the eye imaging systems described herein elsewhere may be used to monitor pupil dilatations as compared to normal conditions to predict head trauma. Each eye may be imaged to check for differences in pupil dilation for indications of head trauma. As another example, an IMU in the HWC **102** may monitor a person's walking gait looking for changes in pattern, which may be an indication of head or other trauma. Biometric feedback from a member indicative of a health or stress concern may be uploaded to a server for sharing with other members or the information may be shared with local members, for example. Once shared, the digital content in the FOV that indicates the location of the person having the health or stress event may include an indication of the health event.

[0208] FIG. **41** illustrates a situation where the primary BlueForce member **4102** is monitoring the location of the BlueForce member **4104** that has had a health event and caused a health alert to be transmitted from the HWC **102**. As described herein elsewhere, the FOV of the HWC **102** of the primary BlueForce member may include an indication of the location of the BlueForce member with the health concern **4104**. The digital content in the FOV may also include an indication of the health condition in association with the location indication. In embodiments, non-biometric sensors (e.g. IMU, camera, ranger finder, accelerometer, altimeter, etc.) may be used to provide health and/or situational conditions to the BlueForce team or other local or remote persons interested in the information. For example, if one of the BlueForce members is detected as quickly hitting the ground from a standing position an alert may be sent as an indication of a fall, the person is in trouble and had to drop down, was shot, etc.

[0209] Another aspect of the present invention relates to virtually marking various prior acts and events. For example, as depicted in FIG. **42**, the techniques described herein elsewhere may be used to construct a virtual prior movement path **4204** of a BlueForce member. The virtual path may be displayed as digital content in the FOV of the primary BlueForce member **4202** using methods described herein elsewhere. As the BlueForce member moved along the path **4204** he may have virtually placed an event marker **4208** such that when another member views the location the mark can be displayed as digital content. For example, the BlueForce member may inspect and clear an area and then use an external user interface or gesture to indicate that the area has been cleared and then the location would be virtually marked and shared with BlueForce members. Then, when someone wants to understand if the location was inspected he can view the location's information. As indicated herein elsewhere, if the location is visible to the member, the digital content may be displayed in a way that indicates the specific location and if the location is

not visible from the person's perspective, the digital content may be somewhat different in that it may not specifically mark the location.

[0210] Although embodiments of HWC have been described in language specific to features, systems, computer processes and/or methods, the appended claims are not necessarily limited to the specific features, systems, computer processes and/or methods described. Rather, the specific features, systems, computer processes and/or methods are disclosed as non-limited example implementations of HWC. All documents referenced herein are hereby incorporated by reference.

We claim:

**1.** A method of presenting an indication of another person's ("other person") known location to a person wearing a see-through display of a head-worn computer ("first person"), comprising:

- Receiving geo-spatial coordinates corresponding to the other person's location;
- Receiving geo-spatial coordinates corresponding to the first person's location;
- Receiving a compass heading for the first person that is indicative of a direction in which the first person is looking;
- Generating a virtual target line between a see-through visual plane of the head-worn computer and other person such that the target line describes a distance and angle between the other person's location and the first person's location; and

Presenting, in a field of view of the head-worn computer, digital content to augment the first person's view of an environment through the see-through display of the head-worn computer, wherein the digital content is positioned within the field of view along the virtual target line such that the first person perceives the digital content in a position within the environment that represents the other person's known location.

**2.** The method of claim **1** wherein the geo-spatial coordinates corresponding to the other person's location and the first person's location include altitude, longitude, and latitude.

**3.** The method of claim **1** wherein the compass heading for the first person is based on an electronic compass in the head-worn computer.

**4.** The method of claim **1**, wherein the compass heading for the first person is based on images of the environment captured by a camera in the head-worn computer.

**5.** The method of claim **1**, wherein the geo-spatial coordinates corresponding to the other person's location indicates that the other person is behind an object that obstructs the first person's view of the other person; and wherein the digital content indicates that a clear view is not available.

**6.** The method of claim **1**, wherein a remote server is used to generate the target line.

**7.** The method of claim **1**, wherein the target line is generated local to the head-worn computer.
