S1. Supplemental Materials and Methods

Text S1. Materials and reagents.

N,N-Dimethylformamide (DMF) was bought from Tianjin Beilian Fine Chemical (Tianjin, China). $\text{Ce}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$ was purchased from Adamas Reagent (Shanghai, China). 1,4-dicarboxybenzene (H_2BDC), sulfamethazine (SMT), bisphenol A (BPA), and Norfloxacin (NOR) was supplied by Aladdin Chemistry (Shanghai, China). Iron chloride hexahydrate ($\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$), hydrogen peroxide (H_2O_2 , 30wt%), ethanol ($\text{C}_2\text{H}_5\text{OH}$), tert-butyl alcohol (TBA), p-benzoquinone (BQ), hydrochloric acid (HCl), sodium hydroxide (NaOH), and phosphoric acid (H_3PO_4) were purchased from Sinopharm Chemical Reagent Co., Ltd., (Beijing, China). Methanol was bought from Sinopharm Chemical Reagent high-performance liquid chromatography (HPLC) grade, while acetonitrile was purchased from Cinc HPLC grade. Other drugs were analytically pure.

Text S2. Analytical Methods.

The concentration of NOR, BPA, and SMT in the extracted solution was analyzed using L6 high-performance liquid chromatography (HPLC, Persee, China) with a UV detector and an Agela C18 column ($5\ \mu\text{m}$, $4.6 \times 150\ \text{mm}$). The detection wavelengths of NOR, BPA, and SMT were set to 278, 224, and 275 nm, respectively. The mobile phase consisted of 0.2% phosphoric acid/acetonitrile (80:20), methanol/water (75:25), and acetonitrile/water (65:35) for NOR, BPA, and SMT, respectively, and the flow rate was set to 0.7 mL/min. The dissolved concentrations of iron ion at different pH were detected by Avio 200 Inductive Coupled Plasma Optical Emission Spectrometer (ICP-OES, PerkinElmer, USA). The solution to be tested was taken from the Fe/Ce-MIL-101/ H_2O_2 system and filtered with a $0.22\ \mu\text{m}$ membrane.

Text S3. Identification of degradation intermediates and pathways.

Density functional theory (DFT) calculations of degradation pathways were performed by Gaussian 09 program.¹ And atoms energy calculations were performed at B3LYP-D3BJ/def2-SV(P) level². The solvation model of density (SMD) implicit solvation model³ was used to take account of the solvation effect of water. The condensed electrostatic potential (ESP) mapped molecular surface was obtained by the Multiwfn program⁴. The Fukui function was introduced to describe the nucleophilic, electrophilic, and radical attacks.⁵ The simplified Fukui function corresponding to the above three situations are as follows:

$$\text{Nucleophilic: } f_k^+ = q_N^k - q_{N+1}^k$$

$$\text{Electrophilic: } f_k^- = q_{N+1}^k - q_N^k$$

$$\text{Radical: } f_k^0 = (q_{N-1}^k - q_{N+1}^k)/2$$

Where k is the number of atoms used in the calculation, N is the number of electrons in the current state, and q^k represents the atomic charge population number of the atom k . In this study, free radical reaction is the most important mechanism, so f_k^0 of NOR molecule was employed to study the degradation pathway. The greater the value of f_k^0 , the more vulnerable the site is to free radical attack.

Text S4. The kinetic analyses of the degradation data.

The pseudo-first-order kinetic model was used to fit the curves of NOR degradation by Fe-MIL-101 and Fe/Ce-MIL-101. The degradation curves can fit with the equations:

$$-\ln(C_t/C_0) = kt$$

where,

C_0 : NOR concentration at the time of $t=0$ (mg/L);

C_t : NOR concentration at the time of $t=t$ (mg/L);

t : degradation reaction time (min);

k : degradation reaction rate constant (min^{-1}).

S2. Supplemental results and discussion

Fig S1. (a) FESEM image, (b) and (c) TEM image of Fe-MIL-101.

Fig S2. The XPS spectra of (a) survey scans and (b) Ce 3d of Fe-MIL-101 and Fe/Ce-MIL-101-5%.

Table S1. Metal content ratio of Fe to Ce in different Fe/Ce-MIL-101 catalysts.

Catalysts	Fe		Ce	
	Concentration (mg/L)	Proportion	Concentration (mg/L)	Proportion
Fe/Ce-MIL-101-3%	55.28	95.7%	2.47	4.3%
Fe/Ce-MIL-101-5%	22.34	93.4%	1.58	6.6%
Fe/Ce-MIL-101-7%	42.18	91.7%	3.82	8.3%
Fe/Ce-MIL-101-10%	46.42	87.0%	6.91	13.0%

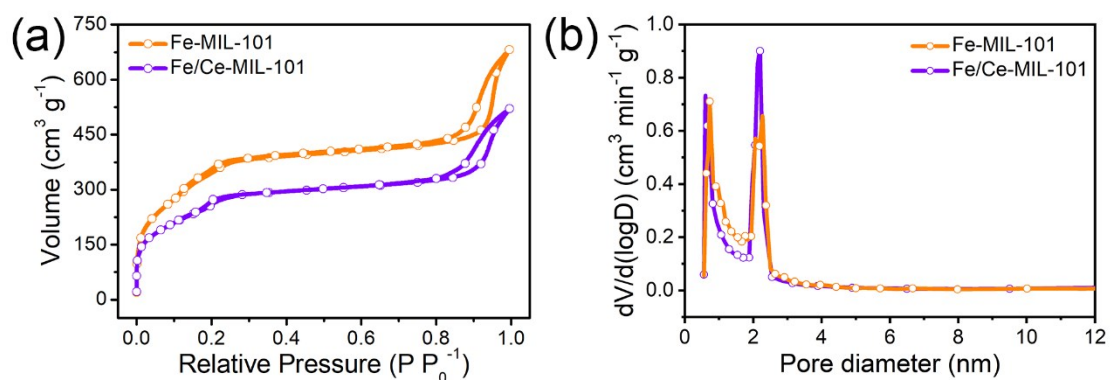

Fig S3. (a) N₂ adsorption-desorption isotherms and (b) relative pore size-distribution profiles spectra of Fe-MIL-101 and Fe/Ce-MIL-101-5%.

Table S2. Specific Surface Area and Pore Characteristics of Fe-MIL-101 and Fe/Ce-MIL-101.

Sample	S_{BET} (m^2/g)	Average pore diameter (nm)	Total pore volume (cm^3/g)
Fe-MIL-101	1268.01	3.325	1.054
Fe/Ce-MIL-101	922.25	3.491	0.805

Fig S4. (a) The removal rate of Fe/Ce-MIL-101 only for NOR. (b) The adsorption isotherms of NOR uptake by Fe/Ce-MIL-101. Reaction conditions: [NOR]=10 mg/L, catalyst=0.3 g/L, T=25 °C, initial solution pH=7.0.

Table S3. Adsorption capacity of Fe/Ce-MIL-101 for NOR.

Sample	Langmuir constants			Freundlich constants		
	q_m (mg/g)	K_1 (L/mg)	R^2	K_F (mg/g(L/mg) ^{1/n})	n	R^2
Fe/Ce-MIL-101	47.393	0.013	0.906	1.623	0.823	0.970
